REMOTE SENSING OF PRECIPITATION AND ELECTRIFICATION WITH A DUAL-POLARIZATION, COHERENT, WIDEBAND RADAR SYSTEM Annual Report No. 3, 15 Jul. 1991 - 14 Jul. 1992
Paul R. Krehbiel and Grant Gray 17 Sep. 1992 8 p
(Grant AF-AFOSR-0450-89)
(AD-A259834; AFOSR-92-1001TR) Avail: CASI HC A02/MF A01

The New Mexico Tech Wideband/Coherent Radar was shipped by rail to Kennedy Space Center on 17 July 1991. A problem in the transmitter cooling system delayed full operation until mid August. Electrification signatures were first observed on 15 September and numerous cases were documented between then and tear-down on 6 October. In addition, several cases of coordinated dual-Doppler and tomographic data were acquired in conjunction with the NCAR CP2 radar. Preliminary results have been presented in papers and conferences. After its return to New Mexico, several upgrades were made to the transmitter to increase reliability. GRA

ENVIRONMENT OBSERVATION AND CLIMATE MODELLING THROUGH INTERNATIONAL SPACE PROJECTS. NAVIGATION AND MOBILE COMMUNICATIONS. IMAGE PROCESSING, GIS, AND SPACE-ASSISTED MAPPING
T. Duc Guyenne, ed. and James J. Hunt, ed. Jul. 1992 428 p In ENGLISH and FRENCH Conference held in Munich, Germany, 30 Mar. - 4 Apr. 1992; sponsored by EEC, ESA, Deutsche Agentur fuer Raumfahtangelegenheiten, and the European Association for the International Space Year
(ESA-ISY-2; ETN-93-93505) Copyright Avail: CASI HC A19/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The European International Space Year conference was held with the specific theme of the practical use of space derived information for environmental research, environmental monitoring, and resource management. This main theme, 'Mission to Planet Earth,' was maintained, but it was recognized that other fields needed to be equally addressed to provide a balanced view on space activities. Space sciences, space navigation and communications, and manned space activities were also represented. The present volume consists of papers addressing the following issues: space based systems for navigation and mobile communications; image processing, geographic information systems, and space assisted mapping. For individual titles, see N93-23508 through N93-23586.

MARITIME SATELLITE COMMUNICATION AND NAVIGATION c32

Peter Ehlers *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 5-8 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The contribution of satellite services to improving maritime safety, covering navigation as well as safety and distress communication, is discussed. The availability and accessibility of these services must be ascertained through international agreements. Satellite services will play an essential role for the electronic sea chart display. International carriage requirements and performance standards are necessary for the relevant equipment on board ships. New generic mobile satellite services will also be of relevance for maritime communication. As far as safety and distress communication is concerned, government agreements are necessary.

THE ROLE OF GPS IN A FUTURE RADIONAVIGATION MIX: TRENDS IN THE 1992 US FEDERAL RADIONAVIGATION PLAN **c04**
Heywood O. Shirer *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 9-14 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

An overview of the role of GPS (Global Positioning System) in the future radio navigation mix is given and changes that might be expected in the 1992 U.S. Federal Radio navigation Plan (FRP) are examined. The GPS will have a significant impact on other radio navigation systems and will have a wide range of applications in aviation, marine, land, and non-navigation uses. The GPS SPS (Standard Positioning Service) was offered to ICAO (International Civil Aviation Organization) to form a practical starting point to begin acquiring the operational experience necessary for the development of a Global Navigation Satellite System (GNSS). Work has now begun to develop the policies and plans to be published in the 1992 FRP for GPS and other Federally provided radio navigation systems.

INSURANCE COVER FOR SPACE VENTURES **c81**
Ernst Steilen *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 15-18 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

A discussion on insurance coverage for space ventures covering market development, types of insurance coverage, specific aspects of space insurance, and market experience, is presented. Space risks are seen as generally insurable if a long term oriented underwriting philosophy and a worldwide portfolio are taken into account. Further prerequisites are as follows: careful and professional risk assessment; a qualified staff; coverage concepts that are specifically tailored to each particular risk; and appropriate premiums, including adequate safety margins and loadings, which enable the insurer to make proper allowances for fluctuations in loss experience.

COLLECTION AND DISTRIBUTION OF ECOLOGICAL DATA BY SATELLITE: CDEDS **c45**
F. Gampe, K.-P. Graf (Elektronik-System G.m.b.H., Munich, Germany.), and G. Solari *In its* Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 19-23 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

An ESA/ESTEC study being performed to assess the conditions under which services for ecological data could develop, and to what extent, is reported. Collection and distribution of ecological data is seen as a key item in environmental monitoring. Many public and private bodies and the public itself are interested in objective and reliable information about the state of the environment. Satellite communications can play a significant role for the development of ecological networks and information systems, but their benefits are not well known by the common users.
ESA

COLLECTION AND DISTRIBUTION OF ECOLOGICAL DATA BY SATELLITE PILOT PROJECTS AS DEMONSTRATION OF THE CONCEPT **c45**
K.-P. Graf and F. Gampe (European Space Agency. European Space Research and Technology Center, ESTEC, Noordwijk, Netherlands.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 25-31 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Several proposals for pilot projects to demonstrate the benefits and usefulness of online collection and distribution of in situ ecological data by satellite and to contribute to the promotion of satellite communications in this sphere are presented. The pilot project proposals were elaborated in the frame of the ESA study 'Collection and Distribution of Ecological Data by Satellite' as proof of the concepts developed during this study. In particular, the following are reported: an agricultural information system; an animal tracking system; a radiation and smog early warning system; and a river and coastal water monitoring system.

A EUROPEAN RADIONAVIGATION PLAN? **c04**
D. W. Broughton *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 33-35 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

A discussion on the possibility of a radio navigation plan for Europe is presented. Radio aids to navigation are indispensable for the safe and efficient transport of people and goods. It is unfortunate that the past 50 years have seen the uncoordinated development of such aid in Europe. This could be overcome by the adoption of a radio navigation plan similar to the U.S. Federal Radionavigation Plan which is jointly promulgated at two yearly intervals by the Departments of Defense and Transportation. The International Association of Institutes of Navigation has prompted the Council of the European Community to institute a European plan, and this is about to get under way. Such a plan needs to recognize plans in adjacent areas and indeed the sum of such plans could lead to a worldwide radio navigation plan.

Plans to upgrade Canadian mobile data services by introducing a full, two way mobile voice and data service, using a large geostationary satellite which is scheduled to be launched in 1994, are reported. This Mobile Satellite (MSAT) will offer customers the ability to communicate, using mobile or transportable terminals, from the most remote parts of the continent, to any other point within North America, and indeed the whole world. Currently planned MSAT services are reviewed, the main features of the overall system are outlined, and the configuration and key performance parameters of the MSAT satellite are presented. The communications subsystem is detailed, and a summary of the spacecraft service module is given. ESA

FULLY AUTOMATIC TRANSMISSION OF INFORMATION VIA HF AND COMPARISON TO SATELLITE TRANSMISSION **c32**
P. Iselt *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 45-50 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

For various applications, in particular in long range communications, both HF radio communication and SATCOM systems can be alternatively used irrespective of the technical infrastructure. In the past, HF radio as compared to SATCOM needed an experienced operator to achieve satisfactory results. Modern HF systems enable fully automatic and data protected transmission with a notable transfer rate of 2.4 kbit/s in the 3 kHz channel. In conjunction with an office communication system with appropriate message handling and control software, all data sources and sinks like telefax machines, data terminals, videotex etc., can be connected to different optimized communication systems, including HF system. The result is a cost optimized and redundant multimedia concept which can be custom configured to all needs. ESA

Military programs within the U.S. and the former U.S.S.R. were responsible for providing the technology and hardware for gobal satellite navigation. The Global Positioning System (GPS) from the U.S. is nearing operational status and is demonstrating the potential for gobal navigation and position location. Without radical change, the policies and structures of the institutions that are creating these systems are seen to be incompatible with the requirements and obligations of the international community. The financial impact of redirecting satellite navigation technology for civil use is explored. Alternatives to a single country providing satellite system financing and operation are discussed. A proposal for funding a global system is presented along with an organization that involves the special agencies of the United Nations. ESA

MOBILE SATELLITE COMMUNICATIONS IN THE 1990'S **c32**
Jai Singh *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 69-73 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The evolution of Inmarsat global services from a single market and single service of the 1980's to all of the key mobile markets and a wide range of new terminals and services in the 1990's is described. An overview of existing mobile satellite services, as well as new services under implementation for introduction in the near and longer term, including a handheld satellite phone (Inmarsat-P), is provided. The initiative taken by Inmarsat in the integration of its global mobile satellite services with global navigation capability derived from GPS (Global Positioning System) and the GLONASS (Russian GPS) navigation satellite systems and the provision of an international civil overlay for GPS/GLONASS integrity and augmentation is highlighted. To complete the overview of the development of mobile satellite services in the 1990's, the known national and regional mobile satellite system plans and the various recent proposals for both orbiting and geostationary satellite systems for proving handheld satellite phone and/or data messaging services are described. ESA

PERSONAL COMMUNICATIONS SATELLITE SERVICE SYSTEM **c32**
L. Caporicci, S. DiGirolamo, M. Luongo, and C. Soddu *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 75-80 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The main features of the Personal Communications System (PCS) are outlined. The PCS is composed of the following: a constellation of Low Earth Orbiting (LEO) satellites; and a ground segment made of a variety of user terminals, the gateway stations, the network management, and satellite control centers. A general overview of the system is provided, together with the definition of a satellite constellation suitable for PCS services. The adoption of LEO satellites sensibly reduces the power requirement of user terminals and allows users to share the system capacity among a large number of spacecraft. Results of a comparative analysis of access modes is presented together with the expected spacecraft complexity, which

derives by the alternative adoption of two types of onboard antennas, with 7 and 19 spot beams. An overall dimensioning of the payload and general outline of the spacecraft are given. ESA

N93-23522# Racal Survey Ltd., London (England).
SKYFIX: A BETTER POSITION THROUGH THE USE OF INMARSAT AND GPS **c04**
G. A. H. Mack *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 81-86 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

SkyFix is a satellite based DGPS (Differential Global Positioning System) service which uses the Inmarsat Marine Communications System as the datalink. SkyFix began operation in Aug. 1990, and its coverage is continuing to expand. Already SkyFix serves all the major offshore hydrocarbon exploration areas. The complementary application of two satellite systems and the synergy between them are described. The considerable infrastructure that is required for a comprehensive and professional DGPS system is discussed, and the gains in positioning service quality which can be achieved are demonstrated. ESA

PRECISE FLIGHT NAVIGATION BY INTEGRATION OF GLOBAL POSITIONING SYSTEM AND INERTIAL MEASUREMENT UNITS **c04**
Stefan Vieweg *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 87-92 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Realtime Differential GPS (Global Positioning System) offers precise positioning capabilities. This can be achieved by combination of code and phase measurements with transmitted correction terms from a ground reference via link to the moving receiver e.g., in an aircraft. Although tight ICAO (International Civil Aviation Organization) limits for precision approaches or taxi guidance can be met, this system needs a complement to compensate insufficiencies, for example in dynamic maneuvers or total failure of position information due to satellite masking. Using International Measurement Units (IMU) with good dynamic characteristics but longterm drift as a result of misalignment, accelerometer and gyro errors, Kalman filter techniques are used to predict and eliminate these errors. Loss of GPS position due to jamming, satellite shadowing dynamic influences leads to a decreasing filter accuracy, if the GPS position is taken as reference (measurement vector) for the Kalman filter. Therefore a filter concept which is sustained by uncorrelated range and range rate measurements is discussed. Several investigations by means of simulation and flight tests show that the strategy chosen is able to perform precise position and attitude information. Even under dynamic environment with separated satellite masking an accuracy to meet the tight limits for precision approaches can be fulfilled. ESA

SATELLITE NAVIGATION IN AGRICULTURE **c04**
H. Auernhammer and K. Wild *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 117-120 (For primary document see N93-23507

08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Change in agriculture in the 1990s is discussed. Lower production costs and better protection of the environment are required. Location and navigation for monitoring purposes as well as for site specific operations within a crop field is required for environmental oriented agriculture. It can lower inputs of farm chemicals and nutrient infiltration. Location sensing is used for simple yield monitoring and for application monitoring in water protection areas. The needed accuracy is within 1 to 5 m which can be accomplished by GPS (Global Positioning System) with post processing or by DGPS (Differential GPS). Overlaps and gaps during application of organic and mineral fertilizer and pesticides could be avoided with navigation. Accuracy for this task must be less than or equal to +/- 10 cm. Most precise navigation within a +/- 1 cm range will take place in tractor and implement guidance. These techniques are essential to switch from chemical to mechanical weed control and to get a more powerful performance under optimum conditions with more and more automized vehicles. Satellite navigation can fulfill the present needs within an accuracy of +/- 1 m down to +/- 10 cm. For more exact field work it should be supplemented by dead reckoning systems, other ground based navigation systems or by machine vision. ESA

TOWARDS GLOBAL SATELLITE NAVIGATION **c04**
J. M. Durand *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 121-125 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The Global Positioning System (GPS) will offer extremely high navigation performance and has a promising future for most civil navigation neeeds. The GLONASS (Russian GPS) system is similar to GPS in its objectives. However, GPS and GLONASS have separately three major disadvantages for civil user: insufficient integrity, since many simultaneous users can obtain false positions and remain unaware of the problem; insufficient availability, since users can be unable to obtain a position fix or else can obtain a result with significantly degraded performance; for GPS only, deliberate spatio-temporal degradation ('selectice availability') of system performance, the characteristics of which are kept secret. Many solutions to these problems have been put forward. The comparison leads to the recommendation of a system to monitor the status of the GPS satellites and broadcast the information to users. The characteristics of such messages would be as similar as possible to those of GPS messages. Such a system is known as Geostationary Overlay, or GPS Integrity Channel (GIC) or European Complement to GPS (CE-GPS). These different points are developed and the status of the subsequent international coordination is considered. ESA

N93-23530# Kayser Threde G.m.b.H., Munich (Germany).
COMLINE **c32**
N. Balteas *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 127-131 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

COMLINE is primarily a single channel satellite based communication capability for educational applications. The primary goal of COMLINE is to establish a worldwide (hot) communication line for schools and highschools with adequate groundstations, to enable scholars and students to get experience with space problematics, innovative techniques and technologies via useful and practical applications. The communication with the satellite can be established from the classroom and an antenna on the roof or even with a dipol antenna on the way. Because of the ultralightweight groundstations, which are required to establish the communication and the worldwide coverage of polar satellites, these links can also be used on a variety of mobile communication applications for packet radio data transmission. It can even be used for backup emergency communications after environmental disaster. ESA

FLEET MANAGEMENT BASED ON SATELLITE POSITIONING AND COMMUNICATION **c32**
Bernd Hossfeld *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 133-134 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Computerized systems for vehicle location, communication and fleet management provide permanent and direct on route access to the fleet. Thus time schedules, routes and cargo assignments can be optimized. Transport hazards can be identifed and minimized or avoided. The functionality of such a system is based on the following matched components: sufficiently accurate positioning of each vehicle based on GPS (Global Positioning System); communication system, functioning no matter what the position of the vehicle is via Inmarsat; centralized, computer based management system, which will keep the dispatcher free from routine tasks, provide hints for decision finding in tactical situations, enables access and control based on a digital map information system. ESA

N93-23532# Jena-Optronik G.m.b.H. (Germany).
A STAR PATTERN RECOGNITION SENSOR (SPRS) OF HIGH ACCURACY: A CONTRIBUTION TO NEW POSSIBILITIES OF AUTONOMOUS ATTITUDE DETERMINATION **c19**
W. Skarus, D. Ratzsch, and C. Elstner *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 135-139 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Using CCD (Charge Coupled Device) arrays in connection with modern image processing algorithm a new generation of starsensors with entirely new utilization features was developed in the late 1980s. They were successfully applied in missions like Astro-C, Granat and Rosat as components of the attitude measuring system and as a reference system for scientific instruments. In all applications the star sensors were used as so called trackers; they compute and put out the coordinates of the registered stars only. The potential possibilities of a star sensor are not fully utilized this way. Considering the inertial character of the natural starry sky a direct attitude determination is possible by applying an 'intelligent' star sensor which is able to recognize the registered star pattern and, thus, to calculate the sensor's attitude. A European prototype of such a star pattern recognition sensor, the Astro 1, was developed and manufactured. Both in-orbit and on-ground test results of the SPRS are presented. ESA

AN INTEGRATED CAR NAVIGATION SYSTEM USING A SINGLE PROCESSOR FOR GPS SIGNAL PROCESSING, POSITIONING, MAP DISPLAY, AND REPORTING **c04**
Philip G. Mattos *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 141-145 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

GPS (Global Positioning Systems) engines are now available at around 400 dollars. This is both too high for the car manufacturer, and too low to entice new players into the marine market. Integrating the application work into the GPS processor reduces costs by a very large margin, saving processor, ROM's (Read Only Memories), RAM (Random Access Memory) and interfacing. Novel map handling techniques, and low cost LCD (Liquid Crystal Displays), mean that the entire map display and GPS sensor can execute on the same CPU (Central Processing Unit). The position reporting role, where the driver has no display, is even simpler, as much of the work can be delegated to the central base station, allowing a single 16 bit transputer, with only a single ROM and no external RAM to fulfil the task. ESA

NAVSAT is a civil complement to the satellite navigation systems NAVSTAR GPS (US Global Positioning System) and GLONASS (Russian GPS). Using these systems as a base with proven performance characteristics, the build up of a kernel system for a future civil satellite navigation system is intended. A proposal to solve the integrity problem of GPS and GLONASS for civil aviation requirements and to enhance the availability, coverage and accuracy is considered. These tasks will be attained by aid of small navigation payloads flown on suitable host satellites, using a navigation signal with a structure that is compatible to GPS and GLONASS, an appropriate ground segment for navigation signal uplink, satellite position determination, time transfer, communication and set of health minitoring units in the responsibility of national aviation authorities. In the future, this basic constellation may be augmented by additional geostationary and Tundra type satellites to achieve a global service. ESA

The development of an experimental Health Monitoring Unit (HMU) for GPS (Global Positioning System) and GLONASS (Russian GPS) is reported. The purpose of the HMU is to provide timely warnings to the navigation users of the satellite navigation systems if the satellite navigation systems are not used for navigation. The monitoring unit is a key element in the integrity channel concept of a civil overlay NAVSAT to GPS and GLONASS. The most stringent requirements are those of civil aviation: in the nonprecision approach phase horizontal position errors exceeding the 600 m SPE thereshold have to be reported within 10 seconds. The concept of the HMU is to use a GPS receiver as well as a GLONASS receiver in a known location in order to detect large pseudorange errors and to identify the malfunctioning satellites. This means that the station is able to work autonomously. It will also provide pseudorange errors compatible with the American RTCA SC-159 approach and for a future wide area DGPS (Differential GPS) system. ESA

MAP PRODUCTION AND UPDATING USING SPOT DATA AND SPOT DATA DERIVED PRODUCTS
Jean-Claude Rivereau, Philippe Munier, and Serge LeBlanc *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 163-167 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The use of SPOT data on cartography is described. From concept and design to actual tested performances, SPOT imagery is perfectly adapted to cartographic applications. Regular topographic mapping or map updating is achieved at scales ranging from 1:100,000 to 1:25,000 and products such as image maps and digital elevation models are emerging. SPOT georeferenced image maps are used both as a source to extract up to date geographic information and as a base to transfer information. The development of new products is driven by the users' requirements to integrate various sources of information and three products are developing particularly rapidly: analogic image maps which include graphic elements inlaid into the image; digital image maps designed as a direct input to geographic information systems, and digital elevation models extracted from SPOT stereopairs by automatic correlation. SPOT data is therefore considered as a good alternative to carry out cartographic surveys and a basic tool to generate new products for integrated geographic information. ESA

The geometric and cartographic potentials of space images are explored. The complete coverage with actual maps of at least 1:50,000 is a basic demand for the development of any country. With the traditional methods of mapping, a complete coverage of the world may be reached within the next 20 years but there is no tendency to solve the problem of updating. In using images taken from space this problem can be solved. Images made with the following cameras were investigated: Metric Camera (MC), Large Format Camera (LFC), KFA1000, KATE200, MK4, and SPOT. With the exception of the KATE, the achieved horizontal accuracy in mapping is sufficient. The main information necessary for maps 1:50,000 is available in images taken with the LFC, KFA, MK4, and SPOT. Optimal results were achieved in photos from the operational systems KFA followed by SPOT and MK4. ESA

INNOVATIVE APPLICATIONS OF REPEATED SATELLITE SAR SURVEYS
Fabio Rocca and Claudio Prati *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 193-197 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Applications of repeated satellite Synthetic Aperture Radar (SAR) surveys are presented with available experimental results. SAR is a microwave coherent imaging system which has day, night and all weather capabilities. By using synthetic aperture and pulse compression techniques, much higher ground resolution is achieved than with conventional radars. SAR coherence can be exploited for innovative applications of repeated surveys from satellite: digital elevation map generation, improvement of ground range resolution, and measurement of small changes of the terrain. ERS-1 SAR mission represents a good opportunity for testing these applications. ESA

The current situation for the acquisition and circulation of Earth observation data is reviewed and the progress which can be expected from the announced new technologies is assessed. Advantages and drawbacks are identified. Some recommendations for an optimal use of the communication resources are presented. A simple way to reduce investment cost is to combine the programs which require communication equipment. In conclusion, the advantages of the Data Relay System (DRS) are particularly perceivable in terms of acquisition capability for the high data rate sensors, such as the optical imagers or the synthetic aperture radar. The advantage of using specific networks will be observable for the transfer of data between the data acquisition and the processing and archiving facilities and user home bases, not only because of the high data rate transfer capability of the future European networks but also because of the services proposed together with these networks. MAPPING FROM SPOT DATA
E. Ahokas, J. Jaakkola, and P. Sotkas *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 209-213 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The interpretability of different SPOT data in mapping applications is described. Four different scenes, 2 multispectral images and one panchromatic stereopair, from an area of 20 by 30 km in southern Finland were available. Five institutes made nine different interpretations using digital and visual methods. The interpretation results were compared against reliable ground truth. From all SPOT data, only three classes (water, agricultural lands, and forests) could be interpreted accurately. All streets down to the width of 5 m could be detected using visual methods. Best results were obtained using some combination of visual and digital interpretation. ESA

SYSTEM DESIGN FOR ARTEMIS ENVIRONMENTAL MONITORING
H. A. vanIngenSchenau and J. Spaa *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 215-218 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Aspects of system design applied to the ARTEMIS (Africa Real Time Environmental Monitoring using Imaging Satellites) environmental monitoring system of the Food and Agriculture Organization (FAO) of the United Nations are described. The design aspects are derived from characteristics of the monitoring function and are based on methods of rainfall and vegetation monitoring from satellite observations which are widely accepted for the user community. The satellites which meet the requirements for large scale monitoring purposes are the Meteosat geostationary and NOAA polar orbiting satellites. The thematic data processing is based on the method of ten day cumulation of Meteosat infrared data for rainfall estimation and the method of ten day composition of NOAA visible and near infrared data to determine the vegetation index. All processed images and maps are stored in an image database to build a long term archive. The information is used in the FAO monitoring programs and in regional and national institutes in Africa. APPLICATIONS OF SATELLITE DATA ON SEISMIC RISK ASSESSMENT: STRAIN ANALYSIS OF FAULT LINEAMENT SYSTEMS **c46**
P. Bankwitz and E. Bankwitz *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 219-224 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Strain data and analysis from selected seismoactive areas (Tienshan (central Asia), Tibet, and Turkey) are presented with a theoretical background on the use of remote sensing in geological research. Satellite data supply information in crystal deformation is considered. If sufficient fault traces are extracted from images, models of occurrence and distribution of differing strain intensities along tectonic and seismotectonic zones can be deduced. The strain analysis method allows the characterization of different images of a similar scale in regard to the deformation of the crust. This deformation

analysis of selected regions is an additional method for remote sensing technology and seismic risk evaluation. ESA

POTENTIALITIES AND LIMITATIONS OF TOPOGRAPHIC MAPPING FROM SYNTHETIC APERTURE RADAR

Laurent Polidori *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 225-228 (For primary document see N93-23507 08-43)

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The state of the art in radar mapping is presented and potentialities and limitations for topographic mapping are identified. Due to its great sensitivity to relief and its capability of all weather imaging, synthetic aperture radar is a very promising tool for mapping. Three main techniques can be used for topographic mapping from radar images: radargrammetry, shape from shading, and interferometry. Since these mapping techniques do not have the same practical constraints concerning image quality and orbit configuration, the technique may be preferred to the others for a given data set. ESA

THE ORBITAL IMAGING SYSTEM AND ITS POTENTIAL FOR DIGITAL TERRAIN MODELS OF THE EARTH

Donald L. Light *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 231-242 (For primary document see N93-23507 08-43)

Copyright Avail: CASI HC A03/MF A04; ESA, EPD. ESTEC, Noordwijk, Netherlands, HC

An Orbital Imaging System (OIS) to provide imagery data capable of meeting standards for 1:50,000 scale products, including digital topographic model information, is proposed. The proposed OIS would repeat coverage of the Earth every 22 to 45 days with 5 m panchromatic pixels from its convergent stereo linear arrays covering a swath width of 64 km. The sensor would also contain sufficient multispectral bands with 10 to 30 m pixels for a wide variety of international Earth science data users. A system such as the OIS would provide the global image base needed to define vegetation and to produce digital terrain models for global change research and other applications around the globe. ESA

DELIVERY OF INFORMATION FROM EARTH OBSERVATION SATELLITES

J. S. MacDonald *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 243-249 (For primary document see N93-23507 08-43)

Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The requirements for handling data from Earth observation systems are addressed. Starting from the premise that the objective is to acquire an understanding of the state and evolution of Earth, an argument that Earth observation satellite systems are, in reality, systems for delivering information, is developed. This view has implications on how the design of such systems can be approached, and how the data that they produce can be handled in order to derive maximum benefit. These issues are examined, and some of the technical requirements for future satellite based Earth observation systems are put forward, based on the concept that Earth observation is a quantitative measurement discipline that is driven by requirements for information. ESA

MULTISENSOR DATA APPLICATIONS FOR DIGITAL LANDSCAPE MODELS

M. F. Buchroithner, J. Raggam, D. Strobl, and A. Almer *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 251-257 (For primary document see N93-23507 08-43)

Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Multisensor image data originating from various remote sensing missions and going along the trend towards digital photogrammetry can be integrated into Digital Landscape Model (DLM) data bases. For this, the images have to be geocoded into a common cartographic reference system. This is based on the use of parametric mapping models and the integration of a Digital Elevation Model (DEM) to compensate for terrain induced as well as for sensor specific geometric distortions. Hence, complementary to image processing systems and geographic information systems, an appropriate software fulfilling these requirements is an essential tool to link multisensor image data with DLMs. With the workstation Remote Sensing software package Graz (RSG), a comprehensive tool is available, for general geometric treatment, goecoding of, and strereo mapping with multisensor image data. ESA

The development of image matching software for automatically locating large numbers of conjugate points in three line stereo scanner imagery is reported. It is based on areal matching in image pyramids and subsequent local least squares matching for subpixel positioning. Modified photogrammetric adjustment software is used to derive Digital Elevation Models (DEM) and exterior orientation prameters. This combined point determination software is mainly based on collinearity equations for conjugate and ground control points. It allows for the constraining of the exterior orientation of the camera by given flight path and attitude data and by Gauss-Markov statistical processes. The successful applications of the software to airborne data taken with the satellite model of the MEOSS (Monocular Electro Optical Stereo Scanner) camera, including a comparison to an already existing DEM, is reported. The Digital Landscape Model for Europe (DLME) is a pilot project of OEEPE (European Organization for Experimental Photogrammetric Research). It serves the utilization of remotely sensed digital and analog recordings from space in order to determine the basic data for a landscape model such as areal, linear, and, if possible, punctiform topographic objects including relief and highly differentiated land uses. The concept comprises: the integration of different sensors, recording dates, and spectral channels; the development of sensitive methods and their automation for the evaluation of data under radiometric and geometric aspect; and the linkage of the respective results with additional information describing the function of objects. The methodical developments are discussed with regard to their integration into the concept and their further development. ESA

The acquisition of knowledge of vineyard surfaces, as according to the needs of European Economic Community (EEC), who require the true estimation of the EEC farmer's production for correct economical policy planning in agricultural field is addressed. The research and the results of the test performed on the Modena plain, Italy (about 50,000 hectares of which 4,000 are vineyard) devoted to define an operative methodology to be applied to the whole territory of the Emilia Romagna region are described. The main aspects of this job regards the integrated use of remotely sensed data and cartographic (cadastre) data by means of an integrated Geographic Information System (GIS). The proposal methodology is a synergism of automatic detection of changes and visual photointerpretation assisted by computer. In the first phase the cadastre is created by means of ground survey or aerial photo utilization; in the second phase an attempt is made to detect the changes also with the base of multitemporal satellite image analysis. The use of GIS (Geographic Information Systems) to address problems of soil degradation and resorvoir sedimentation in semi arid regions is reported. The Oued Mina (Algeria) watershed was chosen as a test area for developing measurement methods to improve water and soil conservation. The study area, about 1,000 sq km wide, mainly consists of marls with a more or less preserved soil cover and bad-lands as a major feature in places. By processing LANDSAT TM data a principal component analysis was obtained providing information about the soil wetness; the soils were classified by stepwise discriminant analysis. Runoff production and sediment load were determined for each soil type. Slope, aspect,and watershed size for each pixel were derived from a DEM (Digital Elevation Model). Modeling runoff and soil erosion for a test area is shown using partial area concept combined with hydrological runoff model. ESA

An approach to landslide hazard mapping, a major challenge for most of the Latin American countries, based on a range of satellite products is presented. Remote sensing, and particularly SPOT sterescopic image interpretation and classification, now provides the basic information for surface lithology, tectonics, land use, biomass, and makes possible calculation of a digital elevation model used to quantify geomorphology. Raster mode GIS (Geographic Information System) can determine crucial criteria for slope instability, calculate their value, propose a probabilistic model, and prepare a landslide hazard mapping at a scale ranging from 1:25,000 to 1:50,000. Such a methodology was applied in a pilot experimental study in the upper Chicamocha Valley, Colombian Andes. ESA

The mining of oil shale in northeastern Estonia involves some 500 sq km of which approximately 85 sq km is open cast mines. Direct effects of mining activities as well as indirect effects from combustion of the oil shale have become the main environmental problem of the region. A pilot project was initiated for cooperation and exchange of data to derive selected information relevant to environmental monitoring from satellite imagery. The common platform for data exchange is the ARC/INFO system. The project involves on screen extraction of selected cartographic features and comparison with 1:50,00 topographic maps. The development of the open cast mining area between 1986-1991 was studied by digital change detection, using LANDSAT and SPOT multispectral data. A supervised land use classification was carried out to quantify areas that may be threatened by future mining activities. Results were transferred to the ARC/INFO vector GIS (Geographic Information System). ESA

A project to create a library of satellite images to solve particular problems arising in Mediterranean countries such as Tunisia is reported. In the case of Tunisia, images are needed to solve environmental problems, and in particular a complete view of desert growth, mapping in rough country, urbanism, soil occupation, hydrology, etc., is required. Images used in this project (STADIS) are from NOAA, LANDSAT, and SPOT. A technical description of the system is given, and the man machine interface and specific archive problems are outlined. ESA

The use of ERS-1 Synthetic Aperture Radar (SAR) image data for land applications is described. As one of the dominant data and information evaluation tools for land applications are geo-information systems, the spaceborne SAR data will be geocoded for higher level use and will be available for large areas in order to allow quasi operational applications. Both themes are addressed by the research projects of a Radarmap of Germany and the Antarctic Peninsula. Though the sensor and the data will be the same, both projects envisage different goals. Within the Radarmap of Germany, a high resolution and precise geometrically rectified data set will be generated. While generating this dataset, problems of terrain correction and mosaicking of SAR data will be addressed. The entire data set will be stored online in a large optical disk juke box system. Within the radarmap of the Antarctic Peninsula, the ERS-1 data received at the German Antarctica receiving station and processed with a real time processor will be used to geocode and mosaic the data. The real time 100 m pixel browser images allow fast monitoring of polar ocean and glacier phenomena. ESA

The development of an automated satellite multi-image registration and mosaicking system, based on automatic tie-point extraction and navigation correction, for AVHRR (Advanced Very High Resolution Radiometer), TM (Thematic Mapper), and Viking Orbiter, and pregeocoded images is reported. The geometric aspects of image to image and image to ground registration form the core of any such work. However, a significant amount of preprocessing and some post processing needs to accompany this in some cases, in particular for AVHRR. Results for AVHRR multi-scene registration in the Rondonia area of Brazil and pre-geocoded LANDSAT TM imagery of northern Germany are presented. Initial estimates of accuracy shows RMS inter-scene registration of 0.7 km (0.64 pixels) for four resampled AVHRR scenes in Rondonia. ESA

The interest of using 'fusion' and integration operations on data and images from different sensors to obtain more significant results is outlined. It is shown how the fusion operation is of great utility especially for images obtained from space sensors, which differ in data format and in spectral, spatial, or temporal resolution. Several data fusion techniques are reviewed for multisensory data (from multiple remote sensors) with particular reference to scoring models and structure models. A special system for the fusion of space remote sensing multispectral data, based on a G-Net model, is presented, in particular to obtain an efficient image segmentation. The G-Net is an evolution of a Petri net, and can represent both factual (static) knowledge and procedural (dynamic) knowledge in a uniform way. Results obtained by using multispectral LANDSAT TM images are reported. ESA

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Experiments conducted on the classification of remotely sensed satellite imagery using multilayer perceptron neural networks are reported. The implementation of such networks yields results of high accuracy. Training of large networks required for realistic satellite mapping applications can require several hours of computer processing, although classification can be performed very rapidly. Some indications are given of techniques to design appropriate network architectures and to control the training procedures for fast convergence. The neural network method is being evaluated in several operational projects. ESA

Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 353-358 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

A program concerning the definition of an operative methodology for the regular update of the detailed knowledge of information concerning territory for agricultural/forestry planning, urban and environment management is reported. The great number of points covered by the regional forest inventory of Tuscany (Italy) (about 150,000 point samples on a grid of 400 by 400 m), and the use of the other data available (aerial high altitude photos, digital terrain model, and panoramic photos of the surveyed points) permit a correct support for remote sensing applications. The methodology to integrate all the available data is described, taking account of the following problems: integration of data of different nature and support, of different age, scale, and classification. A particular emphasis is put on the integrated use of data with a geographic information system, permitting the use of raster and vector data and the quick update of the modified land use. ESA

ASSESSMENT OF ACTUAL LAND USE BY MEANS OF AN INTEGRATED LIS
C. Conese, F. Maselli, M. Romani, and L. Bottai *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 359-362 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

A methodology based on the use of an integrated Land Information System (LIS) is put forward to improve the performance of automatic classifications based on remotely sensed data. In a case study about a rural area in Tuscany (Italy), some thematic maps reporting morphology and geology were digitized and inserted into the system. The statistical associations between these factors and the distributions of the main cover categories were found and used as prior probabilities for a maximum likelihood classifier with multitemporal thematic mapper scenes. The utilization of ancillary information leads to notable improvements in the discrimination capability of the classifier. ESA

The results of geographic spatial analysis to evaluate land resources for agricultural infrastructure development is reported. Vietnam is an agricultural, developing country with a high population density. Local inhabitants in many places are exploiting forest and agricultural resources, creating a negative impact on production and the people's living. To cope with this problem, the trend in Vietnam is now for promotion of agricultural infrastructure development using regional Geographic Information Systems (GIS). A multilevel GIS based on image processing and GIS technology for regional planning, management, and division making under a tropical monsoon climatic regime was installed. The study reported is divided into three phases: loading of products from remote sensing data and existing maps; importing this data for management in the GIS; and demonstrating the suitability of application for rice fields development. Preliminary results in designing a Geographic Information System (GIS) by which different aspects of the Po River (Italy) basin can be effectively managed are presented. The GIS allows the integration of satellite data provided by various sensors (NOAA-AVHRR (Advanced Very High Resolution Radiometer), LANDSAT Multispectral Scanner, and Thematic Mapper) at different scales. The phenomena studied concern the snow cover changes on Alpine Arch observed at small scale and the crop location in selected areas of the Po plain observed at medium scale. The GIS is used to monitor the effect of the climatic changes in snow cover extension and to determine the environmental impact of the agrotechnologies. ESA

VEGETATION MAPPING AND A STATISTICAL APPROACH FOR THE RECONSTRUCTION OF THE POTENTIAL FOREST COVER USING LANDSAT-5-TM-DATA AND DTM
G. Braun and M. Winiger *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 381-385 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Research on the actual vegetation and the potential forest inventory of the semi arid high mountain landscape of the Karakorum mountains (northern Pakistan), from an ecoclimatological point of view, is presented. The distribution of natural vegetation of the Karakorum mountains is characterized by a distinct altitudinal zonation differentiated by slope aspect. From desert steppes in the dry valley bottoms up to most forest belts and alpine meadows the whole vegetation is exposed to an increasing pressure by human activities like logging and grazing. Research is focused on mapping the spatial arrangement of the actual vegetation by field survey and satellite data processing, aligned with modeling the potential forest distribution from relict stands. The major objective is to quantify the decline of natural forest stands by comparing the actual forest pattern with potential forest distribution. The spatial arrangement of forest extracted from the digital vegetation map and DTM (Digital Terrain Model) can be plotted in a multidimensional space of topographic variables. This provides information about the potential relief related boundaries of the forest formation. Statistical analysis using probability and distance functions allow the empirical reconstruction of the potential forest cover. ESA

INTEGRATION OF DIGITAL IMAGE MATCHING AND MULTI IMAGE SHAPE FROM SHADING
C. Heipke *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 391-400 (For primary document see N93-23507 08-43)
Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

An approach integrating digital image matching and multi image SFS (Shape From Shading) in object space is presented. In a least squares adjustment the unknowns (geometric and radiometric parameters of the object surface) are estimated from the pixel intensity values and control information. The perspective projection is used for the transformation from object to image space. The approach is investigated using synthetic images. The main results are the following: heights of a digital terrain model instead of terrain slopes can be calculated directly using multi imager SFS alone or the combined approach; there is no need for conjugate points in the multi image SFS approach (this is especially important since in weakly textured images the correspondence problem is extremely hard to solve due to the lack of image intensity gradients); if variable albedo is present in parts of the object surface only the combined approach yields correct results (multi image SFS and digital image matching alone fail in this case). ESA

Work to compare the performance of a Neural Network (NN) classifier with a Maximum Likelihood (ML) one when applied to remote sensed multiband images, both in the case of a single date set and a multitemporal composite image, is presented. The comparison was extended to the case where the input data are obtained integrating a satellite image with non remote sensed data, such as digital elevation data. For these three different experimental situations, the overall classification accuracy was evaluated both for NN and ML, comparing the difference in performance on training and test data sets. The results obtained with the two different approaches were related to the statistical measure of the separability on the input data. ESA

ANALYSIS OF HUMAN IMPACT ON DEGRADATION AND DESERTIFICATION OF THE WEST AFRICAN SAHEL BY MEANS OF MULTI-LEVEL REMOTE SENSING TECHNIQUES **c45**

E. Csaplovics *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 413-416 (For primary document see N93-23507 08-43)

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The synthesis of three levels of remote sensing, of in situ derived spectral signatures of trees and shrubs, of detailed vegetation structure interpretation (aerial photography) and of classification on vegetation functional types and units of regional landcover (satellite images) describes an important way of modeling integrated systems of degradation and desertification monitoring of destabilized Sahelian regions. Human impact on vegetation layers of former Südano-Sahelian grasslands is the main reason for these destructive phenomena. The regional distribution and multitemporal dynamics of impact patterns are analyzed by using multistage remote sensing techniques and image interpretation. Monitoring and mapping land use and land cover is a tool for planning restoration of degradated areas. ESA

N93-23579# Computer Graphics Center, Darmstadt (Germany).

THE ANALYSIS OF REMOTELY SENSED DATA WITH NEURAL NETWORKS

A. Stork, M. Gross, and S. Saradeth (Gesellschaft fuer Angewandte Fernerkundung, Munich, Germany.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 417-422 (For primary document see N93-23507 08-43)

Fullam, Inc., Schenectady, NY.), and Alessandro Cacciarini (Cacciarini, Alessandro, Florence, Italy.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 427-432 (For primary document see N93-23507 08-43)

Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

An investigation of the possibility of using methodologies based on remote sensing techniques to monitor areas which present rapid erosion phenomena is reported. As test zone, the ancient medieval town of Civita di Bagnoregio, in the middle of Italy, was chosen, due to the fact that the problems connected to hydrogeologic erosion there assume accelerated and very evident typologies. Thanks to aerial photos and to LANDSAT Thematic Mapper and SPOT satellite scenes, it was possible to investigate the morphologic evolution of the area within a period of about 35 years. The contribution of that analysis was fundamental to understand the environmental dynamics acting there and to plan projects to safeguard an important historical town. ESA

Efforts undertaken in the field of perspective visualization of natural landsapes using Digital Elevation Model (DEM) and satellite images are presented. The principal goal is an image simulation with a high degree of realism. After an appropriate preprocessing including radiometric corrections and image enhancement procedures, a geometric correction is executed in order to achieve a very high co-registration with the terrain model. The mosaic of several satellite images is stored together with the DEM in a data base covering an extensive area. A projection software allows the user to specify all interior and exterior orientation parameters of a virtual camera to compute any perspective scenes. To obtain more realism atmospheric effects can be simulated. The achieved results show that this technology can be used in the field of environmental planning, civil engineering and in many other domains where terrain visualization is required. ESA

THE COMPARISON OF SATELLITE RADAR ALTIMETER DERIVED HEIGHTS WITH GLOBAL DIGITAL TERRAIN MODEL HEIGHTS

J. K. Ridley, P. A. M. Berry (VEGA Space Systems Engineering Ltd.,

Harpenden, England.), C. M. Birkett, and C. G. Rapley *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 445-450 (For primary document see N93-23507 08-43)

Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

A study of the use of SEASAT and Geosat altimeter data for global height determination is reported. Currently available Global Digital Elevation Models (GDEMs) are of limited spatial resolution and accuracy, while satellite altimetry offers the prospects of global coverage of heights with relation to a single reference datum. A global comparison of elevation values derived from satellite altimetry data with those of existing ground based GDEMs is presented. Whilst the coverage of past radar altimeters is such that mean heights can only be generated for about 10 percent of the along track surface, which represents a sampling of only about 1 percent of the world land surface, these data permit a quantitative assessment to be made of GDEM accuracy. The results demonstrate that the planned 176 day repeat of ERS-1 will have the capability to produce an altimeter derived GDEM referenced to a single height datum. ESA

THE PROMISE OF RASTER DATA PROCESSING IN DIGITAL TERRAIN MODELLING

L. Tang *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 451-457 (For primary document see N93-23507 08-43)

Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Two approaches based on raster data processing techniques for solving problems in digital terrain modeling are presented: the raster based triangulation, which allows for a simple consideration of constraint edges; and the medial axis approach for automatically deriving geomorphological elements, for example peaks, pits, saddle points, ridge and drainage lines, from a given set of contours. Using both the given contours and the derived geomorphological elements a high quality digital terrain model can be obtained. Practical examples are given. The achieved results show that the use of raster data processing techniques for digital terrain modeling is promising. ESA

FEATURE DETECTION USING ERS-1 SAR DATA

F. G. Sawyer and D. C. Lancashire *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Navigation and Mobile Communications. Image Processing, GIS, and Space-Assisted Mapping Jul. 1992 p 459-464 (For primary document see N93-23507 08-43)

Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The launch of ERS-1 provides a new opportunity for the exploitation of space based remote sensing. Synthetic Aperture Radar (SAR) provides all weather coverage of the Earth's surface and means that applications requiring the timely delivery of data or information may now be considered. One such application is to detect and monitor shipping. Others are for mapping of sea/ice, pollution monitoring or any application which necessitates imaging routinely or even on a particular day. It is recognized that ERS-1, although limited in the coverage offered, provides a first chance to demonstrate some of these applications. An example of this is given by the SAR Feature Extraction System (SIFES) workstation. The use of radar data requires new algorithms and techniques to those familiar from processing optical data. Targets imaged from ERS-1 appear very different to those imaged from SPOT or LANDSAT. Some of the effects noticeable within SAR imagery and the implications for this in the ground processing chain and in particular the image processing algorithms are discussed. ESA

WATER REGIONS EXTRACTION FROM RADAR IMAGERY USING A NEURAL NETWORK

Tho Con Tran and Pi-Fuay Chen 16 Dec. 1992 5 p (AD-A259517) Avail: CASI HC A01/MF A01

An artificial neural network concept is explored and developed for detecting and extracting water regions from radar imagery. A backpropagation neural network consisting of three layers of processing elements (PE's) is selected for this application. The input layer is composed of nine PE's that are arranged to process a single pixel at the same time. Two PE's in a hidden layer are sufficient for delineating water from other terrain categories. A single output PE with a thresholding function classify effectively all test images into two terrain categories: water and non-water. Large-scale Synthetic Aperture Radar (SAR) images, containing 512 by 512 pixels, were used as the test images for this experiment. Two blocks of water regions totalling 2,048 pixels were extracted for training the network. All the water pixels were classified correctly, while more than 99 percent of the non-water pixels were correctly classified. GRA

1993 EARTH OBSERVING SYSTEM REFERENCE HANDBOOK

Ghassem Asrar, ed. and David Jon Dokken, ed. Mar. 1993 143 p (NASA-NP-202; NAS 1.83:202) Avail: CASI HC A07/MF A02

Mission to Planet Earth (MTPE) is a NASA-sponsored concept that uses space- and ground-based measurement systems to provide the scientific basis for understanding global change. The space-based components of MTPE will provide a constellation of satellites to monitor the Earth from space. Sustained observations will allow researchers to monitor climate variables overtime to determine trends; however, space-based monitoring alone is not sufficient. A comprehensive data and information system, a community of scientists performing research with the data acquired, and extensive ground campaigns are all important components. Brief descriptions of the various elements that comprise the overall mission are provided. The Earth Observing System (EOS) - a series of polar-orbiting and low-inclination satellites for long-term global observations of the land surface, biosphere, solid Earth, atmosphere, and oceans - is the centerpiece of MTPE. The elements comprising the EOS mission are described in detail. CASI

The conference theme was the practical use of space derived information for environmental research and monitoring, and resource management. The topics covered by the presented papers include the following: international Earth observation projects and international collaboration; the ERS-1 program; the SPOT program; the Priroda program; Earth observation research programs and concept synergies; the 1st ESA Earth observation polar platform and its payload; future Earth observation remote sensing techniques and concepts; SAFISY (Space Agency Forum for the ISY) activities; program and strategies of international organizations with respect to earth observation from space; and legal aspects of the use of satellite remote sensing data in Europe. For individual titles, see N93-23749 through N93-23855.

The restructuring of the NASA Earth Observing System (EOS), designed to provide comprehensive long term observations from space of changes occurring on the Earth from natural and human causes in order to have a sound scientific basis for policy decisions on protection of the future, is reported. In response to several factors, the original program approved in the fiscal year 1991 budget was restructured and somewhat reduced in scope. The resulting program uses three different sized launch vehicles to put six different spacecraft in orbit in the first phase, followed by two replacement launches for each of five of the six satellites to maintain a long term observing capability to meet the needs of global climate change research and other science objectives. The EOS system, including the space observatories, the data and information system, and the interdisciplinary global change research effort, are approved and proceeding. Elements of EOS are already in place, such as the research investigations and initial data system capabilities. The flights of precursor satellite and Shuttle missions, the ongoing data analysis, and the evolutionary enhancements to the integrated Earth science data management capabilities are all important building blocks to the full EOS program. NASA'S UPPER ATMOSPHERE RESEARCH SATELLITE: A PROGRAM TO STUDY GLOBAL OZONE CHANGE

Michael R. Luther *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 951-958 (For primary document see N93-23748 08-43)

Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The Upper Atmosphere Research Satellite (UARS) is a major initiative in the NASA Office of Space Science and Applications, and is the prototype for NASA's Earth Observing System (EOS) planned for launch in the 1990s. The UARS combines a balanced program of experimental and theoretical investigations to perform diagnostic studies, qualitative model analysis, and quantitative measurements and comparative studies of the upper atmosphere. UARS provides theoretical and experimental investigations which pursue four specific research topics: atmospheric energy budget, chemistry, dynamics, and coupling processes. An international cadre of investigators was assembled by NASA to accomplish those scientific objectives. The observatory, its complement of ten state of the art instruments, and the ground system are nearing flight readiness. The timely UARS program will play a major role in providing data to understand the complex physical and chemical processes occurring in the upper atmosphere and answering many questions regarding the health of the ozone layer. The past and near future of the NASDA (National Space Development Agency of Japan) Earth observation satellite program are summarized: MOS-1 (Marine Observation Satellite), JERS-1 (Japanese Earth Resources Satellite), GMS-5 (Geostationary Meteorological Satellite), ADEOS (Advanced Earth Observing Satellite), TRMM (Tropical Rain Measuring Mission), and ADEOS 2. These satellites bring massive data to the ground stations, and it is recognized as important that these data should be archived and processed appropriately, and be utilized by scientists through the worldwide data access network. METEOSAT OPERATIONAL PROGRAMME CURRENT MISSIONS AND SERVICES

M. G. Phillips *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 961-965 (For primary document see N93-23748 08-43)

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

An outine of EUMETSAT, the independent intergovernmental organization of 16 European states, now responsible for the continuation of the Meteosat Operational Program (MOP), and missions and services of MOP are presented. The space and ground segments, the spacecraft, and image acquisition and dissemination are described. The Data Collection System (DCS) and Meteorological Data Distribution (MDD) supported by Meteosat are outlined. The combination of four of the Meteosat missions by the user to provide a cost effective integrated meteorological data access system known as Meteosat Operational System for data Acquisition and Interchange (MOSAIC) is described. The extraction of meteorological products and meteosat data archiving are described. The role of Meteosat and other weather satellites in international cooperation is discussed. ESA

METEOSAT SECOND GENERATION: A LOOK TO THE FUTURE

Francois Gerard *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 967-972 (For primary document see N93-23748 08-43)

Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The status of definition of the Meteosat Second Generation (MSG) satellite system is described. Starting with a short history of the evolution of the requirements during the last decade, the characteristics of the future European geostationary imaging radiometer, known as the Spinning Enhanced Visible and InfraRed Imager (SEVIRI), are described. Special attention is given to the coherence of this instrument with those to be flown on the polar orbiting platforms. In conclusion, an overview of the MSG development phases is given, with emphasis on the need for the preparation of MSG operation by developing a synthetic image simulation program enabling scientists to test applications prior to the first launch. SATELLITE-BORNE EARTH OBSERVATIONS IN THE FRAMEWORK OF GERMAN GLOBAL CHANGE RESEARCH

M. A. Lange and B. Rami (Bundesministerium fuer Forschung und

Technologie, Bonn, Germany.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 975-977 (For primary document see N93-23748 08-43)

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

A description of the German components of international global change research and the associated needs for global environmental data to be provided by remote sensing platforms is presented. Changes in the Earth's environment, mainly caused by human activities during the last hundred years call for efficient political countermeasures. These, however, have to be based on sound and reliable scientific investigations and predictions of the future course of our globe. The scientific community has responded to this challenge through a number of recently implemented international global change research projects. Germany has from the onset and will continue to play an active part in these projects. One of the prerequisites of these investigations is the need for long term, continuous observations of Earth system parameters, which cover our entire planet. Satellite-borne remote sensing projects provide the most promising means of fulfilling this requirement. Within German global change research, remote sensing therefore plays an essential role. This role is being realized through a number of national projects as well as through cooperation on the European and the international level. ESA

The Italian space agency (ASI) activities in Earth observation range from ground segment application to planetary exploration activities. These activities are both in national and bilateral cooperation programs as well as in the framework of the Italian participation to ESA. The ASI/NASA Lageos 2-Iris complex, to be launched in 1992, will be the precursor of several ASI efforts devoted to Earth observation. Several missions and development carried out by ASI are addressed. Besides the effort on space segment, ASI had several ongoing activities in precursor airborne demonstration flights, and ground infrastructure development, science and utilization projects. These activities are carried out in close relationship with the national aerospace industry, the Italian science community, and with the main foreign space authority. In this framework, an ASI contribution in the International Space Year activities for natural disaster monitoring and prediction is foreseen. A description of the capabilities of ASI's main ground facility, the ASI center for space geodesy, is given. ESA

ERS-1: THE FIRST EUROPEAN EARTH OBSERVATION SYSTEM

Alfred Setzer *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 983-990 (For primary document see N93-23748 08-43)

Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The ERS-1 mission, mainly dedicated to ocean and ice application is reported. The ERS-1 system, and 'end to end' system for all weather and global environmental monitoring, is described. The program development from first studies to launch is outlined. Numerous pictures were taken by the onboard SAR (Synthetic Aperture Radar) instrument irregardless of daytime and cloud coverage, thus demonstrating its all-weather capability. The accuracy/resolution of approximately 25 m is better than originally specified. Spectacular results were achieved through multi-image processing, thus gaining information about changes which occurred during a given time period or longer term ice observation. The system also demonstrated its capability to observe oil slicks and pollution of the oceans. The global aspect and usefulness of the radar altimeter and scatterometer measurements were well demonstrated, and the data are already now being fed into the various meteorological services to assist in increasing the long term weather forecast and to assist in climate modeling. ATSR (Along Track Scanning Radiometer) data on sea surface temperature, water vapor content etc., being of high importance for climate and ocean circulation observation, were obtained both regionally and globally with an outstanding accuracy. Pilot projects and program continuation are outlined. ESA

A STRATEGY FOR MONITORING THE TROPICAL FOREST WITH ERS-1 SAR IMAGERY

H. DeGroof, A. J. Sieber, A. Sowter (VEGA Space Systems Engineering Ltd., Harpenden, England.), and J. Conway (National Remote Sensing Centre, Farnborough, England.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 991-995 (For primary document see N93-23748 08-43)

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Strategy concepts related to the use of ERS-1 SAR (Synthetic Aperture Radar) imagery for monitoring the tropical forest ecosystem are presented. The feasibility of both a worldwide and a 'hot spot' monitoring approach is discussed. A data processing strategy is presented with references to first results on case studies carried out on ERS-1 SAR data collected during the first months of the ERS-1 mission. Conclusions relating to the following are discussed: even at coarse resolution, the potential separability of the forest/non forest areas is seen; expansion of the ground receiving stations is of utmost importance; the hot point strategy is desirable for efficient information handling; and a worldwide information system should be initiated. ESA

ERS-1 SAR ICE ROUTING OF L'ASTROLABE THROUGH THE NORTHEAST PASSAGE

O. M. Johannessen, S. Sandven, O. Skagseth, K. Kloster, Z. Kovacs, P. Sauvadet (Mers Magnetique, France.), L. Geli (Mers Magnetique, France.), W. Weeks (Alaska Univ., Fairbanks.), and J. Louet (European Space Agency, Paris, France.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 997-1002 Sponsored by NASA, ERS-1 Mission Manager, ESA, and Norwegian Space Center (For primary document see N93-23748 08-43)

Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The use of Synthetic Aperture Radar (SAR) data from the satellite ERS-1 to assist the French polar vessel 'L'Astrolabe' during its navigation through Artic sea ice in the Northeast Passage is reported. The ship spent one month on the voyage from Europe to Japan, and high resolution SAR images and ice maps based on SAR images from ERS-1 and Special Sensor Microwave/Imager were telefaxed to the ship using the Inmarsat system. The time delay from observation to the reception of SAR images aboard the ship varied from 6 hours to two days. The quality of these ice maps was compared with Russian ice maps and observations from the ship. The SAR imagery provided detailed information on ice floe distribution, ice concentration, ice types, open leads, and tracks in ice from icebreakers. The response from the Russian ice specialists on the quality of the SAR ice maps was very positive. ESA

N93-23760# Nansen Remote Sensing Center, Bergen (Norway).

COASTAL OCEAN STUDIES WITH ERS-1 SAR DURING NORCSEX 1991

The Norwegian Continental Shelf Experiment-NORCSEX'91 was conducted between 6-29 Nov. 1991 during the commissioning phase of ERS-1. In this period, about 30 SAR (Synthetic Aperture Radar) scenes were obtained at a regular interval of three days and complemented with in situ observations of wind-wave-current and their interaction collected from ship and moorings. The integrated data base reveals that SAR images document expressions of: mesoscale ocean current circulation pattern including frontal boundaries and eddies; wave-current refraction; internal waves; and rapid mesoscale wind field variations. In some cases, impacts of radar imaging geometry on these image expressions are found. In addition, the expressions of oceanic circulation features are limited by both high and low wind speed. These preminminary results are presented and discussed. ESA

The processing and transmission of SAR (Synthetic Aperture Radar) images is reported. Marine traffic in the northern Baltic is severely affected by ice for several months during the winter. The Ice Service regularly compiles and issues ice charts, and the Finnish Board of Navigation maintains a fleet of icebreakers that keep harbors open and aid ship traffic. The demonstration experiment received ERS-1 SAR fast delivery images in Helsinki during the period Jan. - Mar. 1992. These images were preprocessed, geometrically rectified, and transmitted to the Ice Service and the icebreaker fleet, which also received NOAA images, where a workstation is used by the crew for viewing and interpreting the images. The transmission channels used in the experiment, the processing done to the images and the workstation are described. Experiences gathered and problems encountered in the experiment are described. A summary of ERS-1 SAR (Synthetic Aperture Radar) data capture, transfer, and processing for sea ice monitoring in Canada is given. Ice Center Environment Canada (ICEC) will be receiving up to 20 ERS-1 SAR images per day from the SAR data processing facility. This data will be transmitted in real time by means of a dedicated digital link at T1 data rates (1.544 Mbits/sec). The data will be subsequently captured, processed, and displayed by the Ice Data Integration and Analysis System (IDIAS) and integrated with other data into ice products for marine clients. SAR enhancement and analysis techniques are discussed. Examples of ERS-1 scenes of the ice regime off the Canadian east coast are shown and related to the data sets. ESA

ERS-1 SCATTEROMETER CALIBRATION AND VALIDATION ACTIVITIES AT ECMWF. A: THE QUALITY AND CHARACTERISTICS OF THE RADAR BACKSCATTER MEASUREMENTS
Ad Stoffelen and David L. T. Anderson (Oxford Univ., England.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 1019-1024 (For primary document see N93-23748 08-43)
Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Calibration and validation activities for the ERS-1 scatterometer were carried out at ECMWF (European Centre for Medium range Weather Forecasting), complementary to the 'Haltenbanken' field campaign off the coast of Norway. At a Numerical Weather Prediction (NWP) center, a wealth of verifying data is available both in time and space. By using the data and resources available at a NWP center, it is possible to contribute extensively to a satellite instrument calibration and validation exercise. Noise was estimated and scatterometer measurements were characterized in relation to wind speed and direction. The antennae configuration of the ERS-1 scatterometer proved to be crucial for this work. It is shown that a solution plane is well defined in three dimensional measurement space and measurement noise is low. ESA's transfer model CMOD2 has to be extensively reformulated. ESA

ERS-1 SCATTEROMETER CALIBRATION AND VALIDATION ACTIVITIES AT ECMWF. B: FROM RADAR BACKSCATTER CHARACTERISTICS TO WIND VECTOR SOLUTIONS
Ad Stoffelen, David L. T. Anderson (Oxford Univ., England.), and Peter M. Woiceshyn (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 1025-1029 (For primary document see N93-23748 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Calibration and validation activities for the ERS-1 scatterometer were carried out at ECMWF (European Center for Medium range Weather Forecast) complementary to the 'Haltenbanken' field campaign off the coast of Norway. At a Numerical Weather Prediction (NWP) center a wealth of verifying data is available both in time and space. This data is used to redefine the wind retrieval procedure given the instrumental characteristics. It was found that a maximum likelihood estimation procedure to obtain the coefficients of a reformulated sigma deg to wind relationship should use radar measurements in logarithmic rather than physical space, and use winds as the wind components rather than wind speed and direction. Doing this, a much more accurate transfer function than the one currently operated by ESA was derived. Sigma deg measurement space shows no signature of a separation in an upwind solution cone and a downwind solution cone. As such signature was anticipated in ESA's wind direction ambiguity removal algorithm, reconsideration of the procedure is necessary. Despite the fact that revisions have to be made in the process of wind retrieval; a grid potential is shown for scatterometry in meteorology and climatology. ESA

OPERATIONAL GEOCODING OF ERS-1 SAR IMAGERY
Gunter Schreier and Achim Roth *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 1031-1036 (For primary document see N93-23748 08-43)
Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

An introduction to the ERS-1 is given and the definition of SAR (Synthetic Aperture Radar) geocoded products and their applicability is explained. Basic image geolocation without any further external reference data is performed at the German Processing and Archiving Facility (D-PAF) for ERS-1 on an operational basis. Higher level geocoded data, which include the correction of terrain distortions are also generated. To produce this kind of data, geocoded reference data sets, such as digital elevation models, topographic maps, and automatically derived tiepoints must be archived and accessed. The corresponding data bases and processing algorithms were developed in order to serve the production of terrain corrected products. The entire geocoding of SAR and treatment of reference data is performed on UNIX workstations. The software is written in a

modular fashion to allow possible extensions and the geocoding of other spaceborne SAR missions. Therefore, the D-PAF GEOS for ERS-1 is intended to be a basis for further higher level SAR derived geophysical products, such as SAR interferometry and operational ice floe tracking.

The general status of the SPOT program, an optical Earth observation satellite system giving permanent data source for geographic information, land use, urban planning, and agriculture applications, is described. It is also a tool for local environment issue studies such as deforestation, coastal zone evolutions, urban pressions, evaluation of impacts of civil engineering constructions, etc. It offers the following main features: high resolution, 10 and 20 m; stereo coverage capability offering terrain modeling capability; and high revisit capability. SPOT 1, 2, 3, and 4 are described. Passengers for different missions and experiments on SPOT 4 and the vegetation instrument are described. The high resolution ground optical mission and synthetic aperture radar mission follow on programs are outlined.

The SPOT 4 satellite to extend the high resolution mission through the addition of a new band in the middle infrared region and to extend the life duration is reported. This satellite will embark new passengers and function mainly as a terminal to experiment optical link between a low orbiting satellite (SPOT) and a geostationary satellite. Very high resolution and along track stereoscopic mission are under development, beyond SPOT 4, to satisfy the user needs to maintain and to improve the continuity of the SPOT services.

The development of a ground segment for SPOT 4, compatible with that for SPOT 1, 2, and 3, to be put into service as soon as it is operational, is reported. The ground segment consists of a programming center, a stationkeeping center, an image ground segment, and a commercial management center. The image ground segment, which aims to take into account the peculiarities of the SPOT 4 satellite, to improve the service and to reduce operating costs, is described. The current Space Imagery Receiving Station (SRIS) is to be altered, principally for the replacement of linear recorder by cassette recorder and for the automation of management and communication. A new PASTEL image receiving station is to be used only by SPOT 4, which will fly the experimental optical communication system known as PASTEL. The archive and preprocessing center, which will only produce system rectified products, is described. The system image quality unit groups together the drawing up and monitoring of parameters needed for preprocessing and the follow up of system image quality. Progress and schedule are outlined.

THE SPOT SYSTEM DEVELOPMENT PROGRAM: SPOT AVAL
Veronique Mariette *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 1053-1055 (For primary document see N93-23748 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The SPOT AVAL program was created in 1987 to speed up the development of operational use of SPOT data. This program concerns three main types of activities: promotion of SPOT data at a national and international level; education, training of users, and transfer technology; and development of new services and products derived from SPOT data. Up to now, this program has allowed the setting up of a network of remote sensing users (trainers, institutionals, engineering and services companies, industrials), the development of a methodological and technical knowhow, and the promotion of technology transfer from research level to operational level. This program will now be more oriented to: the valorization of products, including technology transfer; the consolidation of knowhow with the development of environmental applications; the use of SPOT data within large scale national and international projects; and the integration of SPOT data in geographical information systems.

The operational implications of the requirements of the Directorate General 4 (DG4) (Agriculture) of the Commission of the European Communities and the Statistical Office of the European Communities (Eurostat), for regular up-to-date information about changes in acreages and potential yields of major annual crops throughout the European Community are examined. The key expressions that describe Action 4, speed, volume, and stable set of sample sites, are demonstrated. The aim of the MARS (Monitoring Agriculture by Remote Sensing) project is to complement and harmonize European agricultural statistics using a range of new methods, notably remote sensing. The phrases remote sensing and Earth observation cover the use of high resolution satellite borne instruments such as SPOT HRV (High Resolution Visible) imaging instruments and LANDSAT Thematic Mappers, as well as low resolution instruments such as the NOAA AVHRR (Advanced Very High Resolution Radiometer). Apart from the SPOT, LANDSAT, and NOAA series, no other civilian spacecraft currently supply remote sensing data on an operational basis. In response to the requirements of DG4 and Eurostat, the MARS project aims to explore the full potential of these data sets.

The international space project Priroda is described. Priroda is designed to perform remote sensing of the Earth. Experiments on this project are

planned to be fulfilled in 1993-1995 by a special module which will be joined to the Mir orbital station. The instrumental complex of the module includes active and passive remote sensing instruments for microwave, infrared, and visible regions of electromagnetic waves. Most of the Priroda experiments have research and methodic character, some of them are of practical interest. The scientific program consists of land, sea surface, and atmospheric exploration, and ecological research. ESA

The modeling of agricultural geosystems in different physical-geographical zones is discussed as a benchmark for the Priroda Earth remote sensing project. Geosystems are nonlinear dynamic complexes existing in both space and time. Investigations of geosystems consist of spatial structure analysis and determination of parameters of process. The model is represented as a phase trajectory of vegetation growth in the spectral signature space. The coordinates of phase trajectory are interpreted through biogeophysical parameters. The phase trajectory of vegetation growth is obtained from the row of sequence satellite and aircraft images. By experiment on the space data, spatial structures of geosystems (land use, river and erosion network) are proved to have fractal properties. The procedures of fractal dimension determination for different spatial structures are discussed. ESA

The Priroda project is a multisensor mission with active and passive microwave and optical sensors for Earth observation. These devices will be installed on board a specialized module which will be launched and docked at the Mir Station in May 1993. The goal of the mission is the development and verification of multisensor remote sensing methods for investigation of landscenes, oceans, atmosphere, and ecological environment. German participation in the Priroda mission includes contribution to the scientific payload, proposed scientific experiments, and cooperation in ground truth and data processing. As a payload contribution, the imaging spectrometer MOS (Modular Optoelectronical Scanner) was developed for optical sensing of oceans and atmosphere in the visible near infrared region. An overview of experiment proposals for the scientific program is given. ESA

In the framework of its Earth observation program, ESA selected a set of instruments to be carried on a large satellite using the Columbus platform. An alternative scenario of three dedicated missions, based on moderate size satellites using recurring elements from ERS/SPOT, is proposed. This solution, which meets the mission objectives, provides better flexibility and resiliency with respect to financial contingency, conflicting user requirements, difficulties during development, launch, and in-orbit operations. Having a perspective of continuity, the missions will be, in the future, under the responsibility of user entities. It is therefore proposed to develop a preoperational system which will be transferred at recurring costs, after in-orbit qualification. The results of a feasibility study, including both space and ground segments, for two components (Globsat for environment and Metoc for operational meteo/oceano) are presented. Concerning the ground segment, an integrated network of stations compatible with several dedicated satellites is described. ESA

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

An atmospheric chemistry mission will form part of the first European polar platform mission POEM-1. This mission will have two objectives, namely to contribute to the monitoring of key trace gas species such as ozone and to advance knowledge of species and processes. To achieve these objectives it is proposed to fly a set of specialized chemistry instruments. Together these instruments span a spectral range that extends from the ultraviolet to the mid-infrared viewing not only at the limb but also at nadir. The data from these instruments will be enhanced by those from other instruments also included in POEM-1. The candidate instruments comprising the POEM-1 chemistry mission are described: MIPAS (Michelson Atmospheric Sounding); GOMOS (Global Ozone Monitoring by Occultation of Stars); and SCIAMACHY (Scanning Imaging Absorption SpectroMeter for Atmospheric Cartography). A general description of recent activities in the domain of satellite oceanography is presented. A fully equipped space oceanography facility was installed in Dec. 1990, which includes a complete system for receiving, processing, and archiving HRPT data from the NOAA-N satellites. This facility constitutes the backbone of the SATOCEAN project whose objective is the development of the Portuguese capability in the area of satellite oceanography and of its application to marine resources exploration and management in a large region of the northeast Atlantic including the coastal seas and the extensive exclusive economic zone of Portugal. Under SATOCEAN, a comprehensive program of marine research and applications is being conducted with the support of NOAA/AVHRR (Advanced Very High Resolution Radiometer) data, including studies on the fine thermal structure of the upper ocean and on algorithms for the retrieval of Sea Surface Temperatures (SST) from satellite infrared measurements, research on the spatial structure and the temporal variability of SST in the northeast Atlantic, an investigation on coastal sediment dynamics, and a large subproject aiming at the operational support to fisheries. Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The enhanced mission scenario for Meteosat Second Generation (MSG), including the global change monitoring aspects, is described. The SEVIRI (Spinning Enhanced Visible and Infrared Imagers) is described. Emphasis is on the instrument design approach in response to these requirements. A planning survey is included. SEVIRI was designed with 11 to 13 spectral channels between 0.45 and 14.6 micrometer reduced sampling intervals, i.e. higher spatial resolution, and a factor 2 higher repetition rate plus higher raw image data quality requirements. Among the various spectral channels are imaging channels in the atmospheric windows from the visible to 12.5 micrometers as well as a set of 'pseudosounding channels', including an ozone channel. Thus, the mission scenario is much wider than the current Meteosat system. ESA

The possibilities and peculiarities of the usage of a Small Sized Aerospace Plane (SSASP) for global monitoring of the Earth's environment are discussed. The SSASP combines positive qualities of constant space based means and aviation means of Earth observation, so it can be used to research ecological, medical-biological, and technological problems in orbital part of the flight and in the regime of Earth reentry. Possibilities of broad SSASP maneuvering in the pitching and rolling plane with high lift drag to ratio provide a return of useful load and research objects from larger group of orbits as compared with ballistic capsule. The SSASP is a modification of an already known aerospace research plane 'Bor-4', which was tested in flight in 1982-84. ESA

The Michelson Interferometer for Passive Atmospheric Sounding (MIPAS) is a high resolution Fourier Transform (FT) spectrometer for measuring concentration profiles of stratospheric constituents on a global scale. It is selected as an ESA payload for the first Polar Orbiting Earth observation Mission (POEM-1). MIPAS will observe the atmospheric emissions at the horizon of the Earth (limb) throughout the midinfrared region, which allows the simultaneous measurement of more than 20 key trace gases, including the complete NOx family and several CFC's. The design of MIPAS faced many challenges: it is the first spaceborne high resolution FT spectrometer designed for the observation of limb emissions. The need to achieve the required radiometric sensitivity and accuracy required for this type of measurement, the pointing knowledge and pointing stability during an interferogram recording, as well as the lifetime goal of four years of continuous operation are the design drivers of MIPAS.

The Advanced Wind Scatterometer (ASCAT) is a spaceborne instrument for ocean wind field measurement. The ASCAT was intended as a follow-on to the ERS-1 AMI (Active Microwave Instrument) scatterometer. Work is currently being carried out under a POEM-1 preparatory program ESA phase B contract. Future work may be directed to installation of ASCAT onto a meteorological platform. The advanced design and use of state-of-the-art technology results in less demand in platform resources. A three pair antenna configuration doubles the swath width. Novel internal calibration and antenna temperature sensing promise improved radiometric stability. An overview of ASCAT in terms of specification design, calibration, and performance, concentrating on the differences to the AMI scatterometer, is presented.

RA-2 is a fully redounded nadir pointing pulse limited Radar Altimeter (RA) operating with a single antenna dish at 13.8 GHz and at 3.2 GHz. Its design is derived from the ERS-1 RA, but its new signal processing, which autonomously adapts the radar resolution to characteristic and topography of the Earth's surface, and its second fequency channel, will allow RA-2 to operate over ocean, ice, and land without interruption and to correct its height measurements for the errors introduced by the ionosphere. The RA-2 will fly in 1998 on the first European Polar Orbit Earth observation Mission (POEM-1). The RA-2 is to make use of the improved accuracy of its measurements to better understanding of the Earth's environment and to monitor it in global scale.

Europe's first Remote Sensing Satellite (ERS-1) was launched in Jul.

1991 with a preoperational Synthetic Aperture Radar (SAR) as a part of the payload. In order to achieve an operational system within a commercial environment, more flexibility and improved performance will be required. In 1998 ESA is due to launch the first Polar Orbiting Earth observation Mission (POEM-1). This provides the opportunity to fly the first of the next generation of SAR. This is the Advanced SAR (ASAR) which will enable the necessary European technology base for commercial SAR's to be proved. It will be the first to give global coverage and dual channel data. The ASAR objectives and requirements are given and the instrument is described, with advantages over the ERS-1 AMI (Active Microwave Instrument) pointed out. Calibration and characterization, modes of operation, and the predicted instrument performance are described. An outline of the SAR program is given. ESA

THE DESIGN OF THE ESA MULTIBAND IMAGING MICROWAVE RADIOMETER MIMR

Y. Menard and M. Reynolds *In its* Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 1173-1177 (For primary document see N93-23748 08-43)

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The multifrequency Imaging Microwave Radiometer (MIMR) is an instrument to be flown on a polar platform due to be launched in 1998. The operational and functional parameters of MIMR and its mission objectives are described, and the performance, hardware concept, and design and calibration aspects are presented. The MIT is a leap forward in microwave radiometry with respect to already flown radiometers and will provide high performance microwave measurements for determination of global weather and critical oceanographic, atmospheric, cryospheric, and land parameters, to operational forecasts and users and the research community for the years beyond 2000. GLOBAL OZONE MONITORING EXPERIMENT

A. Mariani *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 1193-1196 Sponsored by ESA Prepared in cooperation with LABEN Ferranti International, Vimofrone, Italy, and Technische Physische Dienst TNO-TH, Delft, Netherlands (For primary document see N93-23748 08-43)

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

GOME (Global Ozone Monitoring Experiment) is designed to monitor from space absorption by trace gases in the Earth atmosphere. The instrument will take spectra of the backscattered solar radiation in the spectral range 240 to 790 nm, with a spatial resolution, on ground, of 40 km and a spectral resolution of 0.2 nm. It will use a four channel spectrometer, based on holographic gratings, and cooled arrays of 1024 pixels each as detectors. The integration time can be set within 0.1 and 1500 sec. The instrument will provide the scientific community with the possibility to monitor the column amount and the profile of ozone and the column amount of a variety of trace gases and aerosols by exploiting both DOAS (Differential Optical Absorption Spectroscopy) and SBUV (Solar Backscattered UV light) retrieval techniques. ESA

MILLIMETER WAVE ATMOSPHERIC SOUNDER (MAS)

G. K. Hartmann, N. Kaempfer (Bern Univ., Switzerland.), P. R. Schwartz (Naval Research Lab., Washington, DC.), and K. F. Kuenzi (Bremen Univ., Germany.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 1203-1206 (For primary document see N93-23748 08-43)

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

MAS is a remote sensing instrument for passive sounding (limb sounding) of the Earth's atmosphere from the NASA Space Shuttle. Millimeter wave radiation emitted by the stratosphere and mesosphere in the range between 10 and 100 km will be measured at 61, 62, 63, 183, 184, and 204 GHz with a resolution of better than 4 km. MAS data yield direct information about the height distribution of temperature, pressure, water vapor, ozone, and chlorine monoxide, in the atmosphere and mesosphere, in the latitude ranges +/- 74 deg. MAS will be flown as part of the ATLAS (Atmospheric Laboratory for Applications and Science) missions 1 to 3 (1992-1994); ATLAS 1 is scheduled for 23 Mar. 1992. Further flights on ATLAS missions 4 to 10 are presently under discussion. ATLAS 1 and 2 will occur during

the flight of the Upper Atmosphere Research Satellite (UARS) and MAS will supply important correlative data. ESA

Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The role of polarimetric multifrequency SAR (Synthetic Aperture Radar) systems in investigating global phenomena such as the carbon cycle, hydrological cycle, climate and geological processes, as well as ocean circulation and air-sea interactions, is discussed. Based on user requirements for image performance and rapid change of operational modes, a concept is proposed which involves active phased array antennas for L, C and X band. This SAR system will offer immediate switching of parameters, for example incidence angle, selection of swath with and geometric resolution. The antennas will use transmit/receive modules employing GaAs technology. The latter are designed as Monolithic Microwave Integrated Circuits (MMIC's). The interdependence of system parameters, the major operational modes, and some technological aspects are described for the X band SAR. ESA

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

X-SAR is a Shuttle Borne imaging Synthetic Aperture Radar (SAR) operating in X band (9.6 GHz). It is being developed and operated in a joint venture between Germany and Italy. Integrated together with the L band (1.25 GHz) and C band (5.3 GHz) radar SIR-C of NASA, X-SAR will become part of a multifrequency/multipolarization SAR facility, called Shuttle Radar Lab (SRL). SRL will be operated for approximately 50 hrs during each of the envisaged flights. The first 9 days mission is scheduled for 30 Sep. 1993, the second for Dec. 1994 and the third for Spring 1996; the flight sequence allows monitoring of seasonal changes. ESA

HIGH RESOLUTION STEREO IMAGES FROM THE SPACE STATION MIR

V. Liebig *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 1227-1229 (For primary document see N93-23748 08-43)

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The orbital parameters of the Mir space complex are presented and the KFA-1000 camera system is described. The ground resolution of the images is about 7.5 m, the ground coverage 120 by 120 sq km. To keep track of the thousands of photos, a database system was installed. Plots of the available images are produced after every acquisition period. On customer request special acquisition campaigns are organized for selected areas. The operational flow of a special acquisition mission is introduced. The camera system offers high resolution stereo images for many purposes at low costs. ESA

The International Space Year (ISY) 1992 is a worldwide initiative to enhance international collaboration in the field of space research and to increase public awareness of the benefits of space research for a better understanding of the burning problems of the Earth's environment. Key space missions which contribute to the ISY are: the Upper Atmosphere Research Satellite (UARS) of NASA; the European Remote Sensing Satellite (ERS-1) of ESA; the Japanese Earth Resources Satellite (JERS-1) of NASDA. Organization by SAFISY (Space Agency Forum on ISY) is described. The Earth science and technology projects, education and applications projects, and the space sciences projects are outlined. Special events are listed. ESA

COSPAR/SAFISY PANEL OF EXPERTS ON SPACE SCIENCE SCIENTIFIC PROGRAM FOR THE ISY

A. Chantal Levasseur-Regourd, L. E. Peterson (California Univ., San Diego.), and A. C. Nishida (Tokyo Univ., Sagamihara, Japan.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 1249-1251 (For primary document see N93-23748 08-43)

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The purpose of the panel of experts on space sciences was to assist the Space Agency Forum for the International Space Year (SAFISY) in planning for the ISY. The group developed specific suggestions for scientific activities in all scientific disciplines of COSPAR (Committee on Space Research), except Earth sciences which are under the auspices of the SAFISY Panel of experts on Earth sciences and technology. 'Perspectives from space' is recommended as the main theme for the space science activity. The origin and aims of the panel are presented. Twenty seven projects proposals were identified by the panel as activities intended to expand and facilitate current space science efforts and understanding, and endorsed by SAFISY. These projects, twenty one directly related to science and six related to education and outreach projects, are summarized. ESA

OCEAN COLOUR PROGRAMMES FOR THE EUROPEAN MARINE ENVIRONMENT

V. Barale, P. Schlittenhardt, and L. Fusco (European Space Agency. ESRIN, Frascati, Italy.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 1263-1267 (For primary document see N93-23748 08-43)

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The Ocean Color European Archive Network (OCEAN) project and Ocean Color Techniques for Observation, Processing, and Utilization Systems (OCTOPUS) program are described. OCEAN was aimed at the generation of a data base of bio-optical information in the marine environment, derived from the historical data originated by the CZCS (Coastal Zone Color Scanner) experiment, promotion of the use of ocean color data, and the development of a user network. The present phase of the OCTOPUS program is centered on the utilization of the scientific tools developed within the OCEAN program and on the availability of SeaWiFS (Sea viewing Wide Field of view Sensor) mission data. The program integrates three main components, devoted respectively to: data acquisition, archival and distribution, data processing, scientific analysis and coordination of research efforts, and research activities to be conducted in various European institutions. ESA

N93-23809# European Space Agency. European Space Operations Center, Darmstadt (Germany). Mission Analysis Section.

THE SPACE DEBRIS ENVIRONMENT FOR REMOTE SENSING SATELLITES **c18**

H. Klinkrad *In its* Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 1269-1275 (For primary document see N93-23748 08-43)

Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The data sources for the deterministic (greater than 10 cm), the nondeterministic (greater than 1 cm) and the small size space debris population (less than 1 cm) are reviewed, including assessments of their expected accuracy. Based on the USSpaceCom (United States Space Command) catalog, spatial object distributions and their effect in low Earth orbit collision risks are analyzed with due regard to remote sensing platforms (ERS-1, Polar Platform, Columbus). Conclusions on the growth of man made space debris, avoidance of catastrophic collisions, and spacecraft operability improvement, are given. Current knowledge of the space debris environment is mainly based on data in particulates smaller than 1 mm (retrieved surfaces) and larger than 10 cm (USSpaceCom Catalog). Inflight sensors on Sun synchronous orbits are suggested as best suitable to improve knowledge in the poorly observable yet high collision risk 1 mm to 10 cm debris objects, so far only analyzed by experimental ground based 'spot checks'. Such instruments could fly either in dedicated platforms or as passengers of remote sensing missions. ESA

THE MARINFOSEC STUDY: USE OF ERS-1 FOR CRUISE AND SAILING BOATS **c32**

K.-U. Komp *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 1277-1278 (For primary document see N93-23748 08-43)

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

A study within the ERS-1 framework, Marinfosec (improvement of nautical information for yachting, touristic cruising and tourisitic marine security), is presented. Actual and reliable information on wave direction and height could increase marine security in many fields, especially for cruise and sailing boats. ERS-1 data from SAR (Synthetic Aperture Radar) and AMI (Active Microwave Instrument) recordings will provide all weather data on wave direction and length, wave height and wind vectors. A broad range of applications of those data would be welcomed if presented right in time in a simple form. The objective is to provide actual wave maps distributed by weather fax. The demand structure and marketing potentials are studied, potentials of acceptance are evaluated, a model for later real time data processing and distribution is designed, future satellite configuration and the terms for a practical test phase are defined. ESA

Results obtained in the SEAMEO France project in 1989-1991 are reported. This is a three year project that was started in 1989 by SEAMEO with technical and financial support from France, with the Philippines, Indonesia, Malaysia and Brunei Darussalem participating in the project. The ultimate end product will be the development of methodologies and training in monitoring deforestation using satellite data for sustainable environmental management. The project offers an opportunity to transfer to the SEAMEO countries the knowhow required to carry out surveys in the state of deforestation. NOAA satellite data is used for small scale information over large areas and SPOT satellite data are used for detailed operational information over selected test sites. The overall project concept includes training of scientist (about 20 national scientists in two years) in image processing, image analysis, and ultimate production of maps and statistics on deforestation. ESA

MONITORING DESERTIFICATION IN PATAGONIA/ARGENTINA, USING SATELLITE DATA FOR SUSTAINABLE ENVIRONMENTAL MANAGEMENT

Volker Roenick and J. Ayesa (Instituto Nacional de Tecnologia Agropecuaria, Bariloche, Argentina.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 1287-1290 (For primary document see N93-23748 08-43)

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

General features in Patagonia are presented and the setting up of a project of control of desertification is described. The most serious ecological problem of Patagonia is its more or less gradual desertification: advancing degradation and loss of natural resources, especially vegetation and soils, mainly caused by overgrazing in dominant sheep farming. The project of technical cooperation is presented. This project is dealing with systematical inventories of desertification processes, implementation of measures of control, and ecological monitoring system. ESA

CONTRIBUTION OF REMOTE SENSING AND GIS FOR RANGELAND MANAGEMENT IN THE REGION OF OUARZAZATE (MOROCCO)

Abou Bekr Seddik Gueddari and Christian Crepeau (SCOT Conseil, Toulouse, France.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 1291-1292 (For primary document see N93-23748 08-43)

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The rangelands in the Ouarzazate area are severely degraded because of the overgrazing, the cutting of woody species for fuel use, and the ploughing of the best ranges. A project for the improvement of these arid and semi-arid rangelands is reported. The project has three components: botanical and phytomass monitoring with ground stations; ecological and pastoral monitoring with remote sensing; and zootechnical and sanitary monitoring. ESA

Research and training activities concerning a test zone in the vicinity of the town of Arequipa, were focused on the utilization of space imagery and other digital data for the cartography of hazards in volcanic areas. High ground resolution SPOT XS and P imagery permitted the follow up of the eruption of Sabancaya volcano, from the pre-eruptive stage in 1986 to continuous eruption starting in May 1990. Successive stereoscopic SPOT scenes were used to describe and monitor the various geological hazards linked with the eruption. A geodynamic model gave indications on the gross distribution of major hazards in the region. Digitized topogaphic data appeared to be very efficient for portraying large landslides. Digital Elevation Model (DEM) processing showed for the first time in this region a very large collapse affecting a whole volcanic caldera. The superimposition in a Geographic Information System (GIS) of all available geoenvironmental and geographic data concerning the Arequipa area and the Misti volcano provides information on the major geological risks threatening the town of Arequipa. GEOENVIRONMENT CARPATHES PROJECT [PROJECT GEOENVIRONNEMENT CARPATES]

Andre Fontanel and Jean Chorowicz (Paris VI Univ., France.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 1297-1299 In FRENCH (For primary document see N93-23748 08-43)

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The GeoEnvironment Carpathes project to develop European cooperation in the domain of geosciences and environment is described. The project will contribute to better understanding of geological phenomena controlling the Carpathian chain thus allowing prospective oil and gas structures to be forescast and located. An objective of the project is also to define a common methodology to use geocoded remote sensing data to monitor on soils and vegetation, environmental impacts of oil, gas and mining or more generally natural resources exploitations. The participants are various organisms and institutes from western and eastern Europe. They have already started to exchange their scientific experience and geological knowledge of the Carpathian chain and will build together, in selected areas and by using common standards, a digital data base including topographic data, geocoded remote sensing images, geological contours, selected geophysical data, and locations of mining and oil exploitations. Initial and professional training of personnel is an important part of this program. ESA

APPLICABILITY OF SATELLITE REMOTE SENSING FOR SLOPE INSTABILITY HAZARD ZONATION

Niek Rengers and Robert Soeters *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 1301-1305 (For primary document see N93-23748 08-43)

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The possibilities and limitations of scale and resolution of remote sensing imagery, when it is used for slope instability hazard analysis, are discussed. Key factors are the size of the slope instability phenomena and the various scales at which hazard maps should be prepared for regional, local, and site planning purposes. Conclusions are presented about the applicability of available types of airborne and satellite remote sensing imagery and desirable developments for the future are indicated. ESA

RESULTS OF INTERNATIONAL MEETING HELD IN TUNIS (TUNISIA)

Mohamed Gammar *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 1307-1308 (For primary document see N93-23748 08-43)

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The results of an international meeting on 'urbanization and remote sensing, geographic information system, and environment' are reported. The results lead to: the contribution of remote sensing; the need to initiate remote sensing projects in conjunction with clearly defined needs; the importance of validating the obtained results with the thematic partners; the need to concentrate efforts on the integration of these results, by the partners, into their own information system. The meeting allowed participants to prove that a better understanding of problems (urbanization, agriculture, natural resources) requires a south-south and north-south extended collaboration for a better control of methodologies and standards. The monitoriong of the growth of the city of Tunis (Tunisia) is addressed. A project to provide planners with the necessary tools for monitoring is reported. This project has three main goals: to map the land use changes in the Tunis district; to implement a database; and to contribute to the revision of the urban development plan. The project is intended to be carried out over a period of two years. Several institutions are working for the project: the District of Tunis, the agency for urban development and land management, the agency for agricultural production, and the national agency for environmental protection. The transfer of this methodology to other cities and countries has already started. ESA

An innovative two part Earth systems science course is being developed for middle and high school students throughout the U.S. The course will be formatted on interactive video discs and be interfaced with a television monitor and either a Macintosh or IBM PC compatible computer. This innovative courseware will enable teachers and students, for the first time, to combine historical and the most current test graphics, statistical data, audio, and video footage on Earth systems science to produce creative and dynamic lesson plans, class reports, and presentations. Earth science phenomena will be presented in the context of global change and according to the timescale framework described in the Earth systems science literature. When completed, the courseware, entitled 'Interactive NOVA Earth', may be used by over 100,000 American classrooms each year. If appropriate, the courseware may also be made available in other languages. ESA

A computer based learning system for satellite oceanography developed and distributed by UNESCO (United Nations Education, Science, and Culture Organization) is reported. At its core is a simple PC based image processing software package named Bilko, designed for use on widely available MS-DOS personal computers. Since 1989 three modules of images have been published, each containing the software and a number of image datasets on magnetic disks and a booklet of printed lessons. The images are datasets of ocean variables. Educators using the material have responded by contributing lessons of their own, resulting in the growth of an educational network which feeds the production of further educational material containing examples of satellite data from all oceans of the world. Further modules are in preparation, and eventually all the lesson material will be placed on a Compact Disc Read Only Memory (CD-ROM). ESA

GEOSCOPE: AN INTERACTIVE GLOBAL CHANGE ENCYCLOPEDIA **c45**
Rejean Simard *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 1373-1377 (For primary document see N93-23748 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

An interactive global change encyclopedia (GEOSCOPE), portraying the contribution that remote sensing from space can make to the monitoring of global environmental change on Earth, is being produced for the International Space Year (ISY) in 1992. The data in the encyclopedia will provide global coverage for more than forty parameters from various remote sensing satellites and from ancillary map documents. Other related data, usually with greater spatial resolution, will cover continental and regional areas to illustrate more localized phenomena which are nevertheless linked to global environmental change. The data will be available on diskettes and CD-ROM (Compact Disk Read Only Memory) optical disks. Initially 2 CD-ROMs will contain the global and regional data sets, however, given the volume of data available and being generated annually, there is certainly the possibility of data on future CD-ROM's. The encyclopedia will operate on PC compatible microcomputer platforms in general use around the world. ESA

Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The Global Change Data Base (GCDB) results from a cooperatively developed method of publishing peer reviewed data designed for integrated multivariate spatial analysis. The GCDB with accompanying documentation and accesss software lies entirely within the public domain. It is designed to further research, education, and overall awareness of the global environment; to provide beneficial feedback to enable the authors to enhance their own research and data development; and to provide a mechanism for scientists to share and receive credit for the intellectual content and

expression of their experimental designs, analyses, interpretations, and models of the global environment. The prime medium for distribution is CD-ROM (Compact Disk Read Only Mermory), though educational data sets are being prepared for distribution on floppy diskette, accompanied by a manual of exercises. ESA

J. Askne and T. Thompson (Swedish Meteorological and Hydrological Inst., Norkoeping.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 1393-1397 Sponsored by Swedish National Maritime Administration, Swedish Board for Space Activities, Swedish Polar Research Secretariat, and Wallenberg Foundation (For primary document see N93-23748 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Oden is a Swedish icebreaker which was used for an international Arctic ocean expedition to the North Pole area during Aug. - Oct. 1991. The expedition was supported by a large number of different types of satellite information. Among these the most unique was the ERS-1 Synthetic Aperture Radar (SAR). However the satellites most used onboard Oden for operational applications were NOAA and Ocean-3, which could be received directly onboard in real time. The experience from monitoring of the ice conditions during the Arctic 91 expedition with main emphasis on the transfer of ERS-1 SAR image information to the Swedish icebreaker Oden is reported. Four sub-images and four contour maps were transferred in near real time using HF equipment. The main conclusion is that ERS-1 images can play an important role in the future to support ship navigation, field experiments etc. in the Arctic areas. It is however clear that improved communication systems covering the polar regions are required. ESA

Copyright Avail: CASI HC A02/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

An accuracy validation test project for the Sea Surface Temperature (SST) estimation by satellite data in Mutsu bay (Japan), undertaken as part of the International Space Year (ISY), is reported. The sea and air truth data are provided by the four observation systems operated by independent organizations: Mutsu Bay Automatic Buoy System (MBABS); Automatic Meteorological Data Acquisition System (AMeDAS); Sea Surface Temperature Profiler Buoy (SSTPB); Radio Sonde Observation System (RSOS). The satellite SST is combined with the sea truth SST by MBABS to form matchups for the validation test. Their temporal and spatial coincidences are guaranteed to be within 30 minutes and one pixel resolution, respectively. The data of AMeDAS, SSTPB and RSOS can be effectively referred in the error analysis of the SST estimation. ESA

UNESCO REMOTE SENSING AND GIS ACTIVITIES IN THE INTERNATIONAL SPACE YEAR
B. vonDroste, R. Missotten, and Q. Han *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Volume 3: Earth Observation Space Programmes, SAFISY Activities, Strategies of International Organisations, Legal Aspects 1992 p 1413-1416 (For primary document see N93-23748 08-43)
Copyright Avail: CASI HC A01/MF A04; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

UNESCO (United Nations Education, Science and Culture Organization) makes best possible use of new advances in technology, in particular of remote sensing and GIS (Geographic Information Systems), to enhance international cooperative effort to overcome unsustainability in the use of natural resources and further deterioration of natural and cultural heritage. UNESCO's main remote sensing and GIS activities are described, structured along four themes: study of ocean and coastal zones; ecological and hydrological research in the MAB (Man and the Biosphere) program and IHP (International Hydrological Program); monitoring hazards and risk management; education, training and capacity building. UNESCO actively promotes the use of remote sensing and GIS in ecosystem conservation. The 300 UNESCO designated biosphere reserves in 75 countries represent a variety of ecosystem types which provide a network for the use of GIS and remote sensing in studying environmental changes and generating information for decision makers to address resource development problems. The United Nations (UN) primary forum for international discussions on space activities and the environment is the General Assembly's Committee on the Peaceful Uses of Outer Space, for which the Office for Outer Space serves as the secretariat. Other elements of the UN system are also concerned with the use of space technology for monitoring the environment. The work of the UN relating to space activities and the environment focuses on two areas: the promotion of international cooperation in the use of space technology for monitoring the terrestrial environment; and working to ensure that space activities do not themselves cause damage to the space or Earth environment. In the use of space technology for monitoring the Earth environment, the Office for Outer Space and the Committee on the Peaceful Uses of Outer Space play a modest role, generally in cooperation with the specialized agencies and other international, regional and national organizations. In the second area, that of ensuring that space activities do not harm the environment, the UN and the Committee in the Peaceful Uses of Outer Space play a much more central role.

The operational and research facets of several World Meteorological Organization (WMO) programs are highlighted. The operational World Weather Watch space observing system includes both geostationary and Sun synchronous polar orbiting satellites. The satellites are utilized for remote observations as well as communications and location finding purposes. Present components and future plans are summarized. The international cooperation amongst satellite operators, international organizations and programs are discussed. The increasing worldwide attention to climate issues led WMO to join force with the Intergovernmental Oceanographic Commission (IOC) of UNESCO (United Nations Education, Science and Culture Organization), the UN Environment Program (UNEP) and ICSU (International Council of Scientific Unions) to organize the implementation of a Global Climate Observing System (GCOS). The concept of GCOS and the objectives it serves in all aspects of the World Climate Program are summarized.

Highlights of Earth observation research activities of the Commission of the European Communities (CEC) are summarized. An account is given of the work performed in the area of remote sensing applications for environment and Earth resources by the Joint Research Centre (JRC) of the CEC. The CEC's role as a participant in the Global Change Research program is described. Joint projects in the field of environment and Earth observation between the ESA and the CEC are reported. Research and development shared cost action programs and the Earth observation activities supported by other Community policies are described. Future plans of research at the JRC are summarized.

The Committee on Earth Observations Satellites (CEOS) is outlined and the dynamics of the expanded CEOS with its increased focus on activities related to global climate change are examined. The participation of affiliate organizations at the Dec. 1991 Plenary is highlighted. The roles and current activities of constituted CEOS Working Groups on Data and on Sensor Calibration and Performance Validation are examined. The status of CEOS deliberations in Earth observation data policy is examined. The expanded CEOS is believed to be well suited to carry forward and help further the legacy already well established in the myriad of Earth observation activities associated with the 1992 International Space Year.

Mission to Planet Earth (MTPE) is NASA's concept for an international science program to produce the understanding needed to predict changes in the Earth's environment. NASA and its interagency and international partners will place satellites carrying advanced sensors in strategic Earth orbits to gather multidisciplinary data. A sophisticated data system will process and archive an unprecedented amount of information about the Earth and how it works as a system. Increased understanding of the Earth system is a basic human responsibility, a prerequisite to informed management of the planet's resources and to the preservation of the global environment. An overview of the MTPE, flight programs, data and information systems, interdisciplinary research efforts, and international coordination, is presented.

The United Kingdom (UK) space progam is focused primarily on the Earth observation missions of the ESA. The UK national program complements ESA participation by funding announcement of opportunity instruments and preliminary technology development. Another aim is to sensitize users to the services which can be provided from space. Major challenges lie ahead in the area of data handling. The UK views data as a resource with a 'value', but the international exchange of research data must be encouraged. Data must also be held in a form which is accessible and comprehensible to a variety of interdisciplinary users. ESA

Distribution of data from U.S. Earth observations satellites is subject to different data policies and regulations depending on whether the systems in question are operational or experimental. Specific laws, regulations, and policies are in place for the distribution of satellite data from the National Oceanic and Atmospheric Administration (NOAA) operational environmental satellites and from NASA experimental systems. There is a government wide policy for exchange of data for global change research. For the Earth Observing System (EOS) and its international partner programs, a set of data exchange principles is nearing completion. The debate over the future of the LANDSAT program in the U.S. will impact policy for the programs, but the outcome of the debate is not yet known. ESA

The need of legal protection by those engaged in satellite remote sensing activities, to cover the investment they have made, is addressed. This protection would have to contain a certain number of limitations balancing proprietary interests and the free flow of an unhindered access to information. An overview of existing legal protection reveals that both trade secret and copyright protection show serious shortcomings in providing appropriate protection for raw data. As far as enhanced products are concerned, the situation may look somewhat better. Some aspects of existing as well as of future legal protection are discussed and an examination is made for a suitable forum for achieving the internationally harmonized protection necessary in the field of satellite remote sensing. CORRELATION AND PREDICTION OF SNOW WATER EQUIVALENT FROM SNOW SENSORS

Bruce J. McGurk and David L. Azuma 1992 20 p

(PB93-127413; PSW-RP-211) Avail: CASI HC A03/MF A01

Since 1982, under an agreement between the California Department of Water Resources and the USDA Forest Service, snow sensors have been installed and operated in Forest Service-administered wilderness areas in the Sierra Nevada of California. Because analysis of snow water equivalent (SWE) data from these wilderness sensors would not be possible until just before they are due to be removed, 'surrogate pairs' of high- and low-elevation snow sensors were selected to determine whether correlation and prediction might be achieved. Surrogate pairs of sensors with between 5 and 15 years of concurrent data were selected, and correlation and regression were used to examine the statistical feasibility of SWE prediction after 'removal' of the wilderness sensors. Of the 10 pairs analyzed, two pairs achieved a correlation coefficient of 0.95 or greater. GRA

STUDIES ON DYNAMISM IN PHOTOGRAMMETRY Ph.D. Thesis

Zhengdong Shi 1990 205 p

Avail: Univ. Microfilms Order No. DANN68413

The objective of our research was to study the various dynamisms involved in photogrammetric operations, their sources, their error contributions and their solutions. Our thesis presents a detailed account of an extensive research on dynamism involved in the inputs and outputs of photogrammetric data acquisition and processing. The research study was carried out in three areas, namely dynamism due to photogrammetric imaging systems (e.g., cameras), dynamism due to object movements during exposures and dynamic distortions in instruments for plotting and mensuration. The dynamism due to the imaging systems has been studied theoretically. Analytical approaches for processing such imageries have been developed. Distortions caused by residual image motions due to the inclination of imaging sensors or unflatness of terrain have also been studied and the results indicate the relevancy of applying the developed approaches for the treatment of residual image motions. The dynamic distortions due to object movements have been studied both theoretically and practically. Mathematical models have been derived for estimating and correcting the dynamic distortions. The satellite imaging procedure around the earth was simulated in the laboratory by using an amateur camera to obtain stereo-photographic coverage along a great circle of a rotating globe. This delicate laboratory simulation was carried out to demonstrate the analyses, estimations and corrections for the involved dynamic distortions. The results show that dynamic distortions may be significant and by no means should one neglect their effects during data processing. The research concerning dynamic plotting distortions was performed on a Wild Aviotab TA10 digital plotting table attached to an analytical plotter (WILD BC1). A test procedure has been developed, which can be used on any type of digital plotting tables for detecting dynamic plotting distortions. The test results show that the dynamic plotting distortions are not only significant but also vary according to the following factors: plotting direction, figure location on the plotting table, shape of figure and plotting speed. All the mathematical models, test results and some relevant softwares developed through the research are presented in the thesis. The significance and potentials of the research are also presented. A bibliography is appended also. Dissert. Abstr.

FOREST CLASSIFICATION AND DEAD WOOD MAPPING IN THE BAVARIAN FOREST NATIONAL PARK (GERMANY) USING LANDSAT TM AND DIGITAL ADDITIONAL DATA Thesis - Bonn Univ. [WALDKLASSIFIZIERUNG UND TOTHOLZKARTIERUNG IM NATIONALPARK BAYERISCHER WALD UNTER VERWENDUNG VON LANDSAT-TM-UND DIGITALEN ZUSATZDATEN]

Bodo Coenradie Jan. 1992 201 p In GERMAN Original contains color illustrations

(DLR-FB-92-10; ETN-93-93525) Avail: CASI HC A10/MF A03; DLR, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

In the Bavarian Forest National Park, a great variety of forest and vegetation communities is preserved. By using Thematic Mapper (TM) data, a classification of tree species and natural age classes is made. To take into account various small scale changes of forest type distributions, stand conditions, and illuminations, digital additional data (soil map, DEM (Digital Elevation Model)) is needed for stratification. The Czechoslovakian Republic intends to establish a Bohemian Forest National Park, close to the present Bavarian National Park. With regard to this, the contribution of satellite remote sensing is pointed out to assist planning and inventoring tasks. For this purpose, the classification result is extrapolated to a 30 by 30 km extended area, which includes possible protected Bohemian forests in future. As a part of a natural forest regeneration, dead wood as a consequence of windfalls and bark beetle damages remains in the forest. The National Park Office aspires to monitor these areas. A less expensive and less time consuming method for mapping dead wood by using TM data is developed. ESA

REMOTE SENSING AND GEOGRAPHIC INFORMATIONS SYSTEMS: IMPLICATIONS FOR GLOBAL MARINE FISHERIES

James J. Simpson (Scripps Institution of Oceanography, San Diego, CA.)

1992 28 p
(Grant NA89AA-D-SG-138; Proj. A/S-3)
(PB93-149409; T-CSGCP-025) Avail: CASI HC A03/MF A01

During the decade of the 1990's, several major fishing countries will launch satellites with improved, next generation ocean color sensors. This new technology, especially when combined with satellite-based estimates of sea surface temperature and geographic information systems, provides the possibility of near real-time support for the management and utilization of both pelagic and mid- to deep-water fisheries. This report reviews current state-of-the-art efforts in these areas, makes projections about anticipated uses of the new technologies in global marine fisheries, and evaluates the position of the United States relative to foreign fishing powers in the aforementioned areas. CESIUM-137 IN SOIL TEXTURE FRACTIONS AND ITS IMPACT ON CESIUM-137 SOIL-TO-PLANT TRANSFER
M. H. Gerzabek, S. A. Mohamad, and K. Mueck Jun. 1992 12 p
Repr. from Commun. Soil Sci. Plant Anal., v. 23, 1992 p 321-330
(OEFZS-4632; ETN-93-93452) Copyright Avail: CASI HC A03/MF A01

Field studies at two sites contaminated by the Chernobyl fallout, which showed cesium 137 (Cs-137) soil to plant transfer factors in wheat, rye, and potato, are reported. Transfer values ranged from 0.0017 (potato tuber) to 0.07 (wheat straw). Generally transfer coefficients in cereal grains and potato tubers were significantly below the values of the shoots. A comparison of the two sites led to the conclusion that for all plants investigated, Cs-137 transfer factors were higher in lower Austria (Calcic Chernozem) than in upper Austria (Eutric Cambisol). The specific activities of the texture fractions of the two soil types increased from sand to silt and clay. In the Calcic Chernozem the ratio of the Cs-137 from the silt fraction of the latter soil was clearly lower. Both results mainly were attributed to the differences between the soils according to the organic matter content of the silt fractions (the Calcic Chernozem being seven times higher). Therefore, the differences in the Cs-137 soil to plant transfer can be attributed partly to these soil characteristics. ESA

FINAL REPORT ON THE FIRST STEP IN DISTRIBUTED REMOTE SENSING
G. H. Canavan Mar. 1993 13 p
(Contract W-7405-eng-36)
(DE93-007936; LA-12456) Avail: CASI HC A03/MF A01

Distributed remote sensing (DRS) has a number of promising applications; the World Laboratory's First Step in DRS documented and discussed them widely. Acceptance for DRS is growing in the U.S., the Former Soviet Republics (FSR's), and among global scientific, political, and military leaders. Ecological and defense applications were discussed in international meetings in Dubna and Erice. Its dual-use applications have solid support. The World Laboratory's Global Environmental Monitoring (GEM) project is appropriate, feasible, and an excellent vehicle for communication and cooperation, which could grow rapidly into a global effort. DEVELOPMENT OF MEMBRANE FILM FIBER OPTIC BASED SENSORS FOR THE REMOTE MONITORING OF THE QUALITY OF SURFACE AND GROUNDWATER
L. G. Bachas Aug. 1992 37 p Sponsored by Geolcgical Survey, Reston, VA
(Grant DI-14-08-0001-G-2021)
(PB93-150001; RR-184; USGS/G-2021-05) Avail: CASI HC A03/MF A01

The objective of the study was the development of chromo- and fluoroionophores and their subsequent use in sensors capable of surface and ground water monitoring. Several reagents (modified crown ethers and porphyrins) were synthesized based on principles of chemical recognition and used for metal and pH sensing. The modified crown ether reagents include a chromogenic or fluorogenic group. The selectivity of these reagents is controlled by the size of the crown ether ring and the type of the chromogenic or fluorogenic side-arm. In addition, a fluorogenic crown ether was synthesized that incorporates a fluorogenic sidearm and a per fluorinated carbon chain. The later was used to immobilize the fluoroionophore on PTFE membranes, which were placed at the tip of an optical fiberbundle. The configuration led to the development of a divalent ion-selective fiber optic sensor. Finally, cobalt(II)tetra(p-hydroxyphenyl)porphyrin, (Co(p-OH)TPP) was electropolymerized on the surface of optically transparent electrodes to form membranes composed of the polymerized (Co(p-OH)TPP) chromoionophore. These membrane phases, capable of molecular recognition, were used for the construction of fiber optic sensors. GRA

STRESS CALCULATION FOR THE SANDIA 34-METER WIND TURBINE USING THE LOCAL CIRCULATION METHOD AND TURBULENT WIND
B. Masse and H. Pastorel (Institut de Recherche de l'Hydro-Quebec, Varennes.) Nov. 1992 108 p
(Contract DE-AC04-76DP-00789)
(DE93-004480; SAND-91-7012) Avail: CASI HC A06/MF A02

Stress calculation for wind turbine blades is an important task for the manufacturers of wind turbines. A good prediction of stress level is required to tabulate the fatigue life of the rotor. Design of critical blade joints is based on such calculations. Aerodynamic loads and atmospheric turbulence were identified as important factors in estimating fatigue damage. A stress estimate procedure and its application to the Sandia/DOE 34-meter wind turbine are described. The procedure uses the computer code developed at IREQ (MCL) for aerodynamic load calculation including atmospheric turbulence. Aerodynamic loads are decomposed into modal components and applied to structures using the finite element program NASTRAN. Rotating modes are computed as a linear composition of stationary modes. The stress distributions as functions of frequency are extracted from the modal frequency response for critical locations on the blade. Stress distributions are calculated for the first five harmonics of the rotational speed and for off-harmonic frequencies. Calculated stress amplitude spectra are compared with Malcolm's results and with test data. The results indicate that improved aerodynamic loading is obtained from MCL and that aeroelastic effects needs to be added to obtain better agreement. DOE

FULL VECTOR (3-D) INFLOW SIMULATION IN NATURAL AND WIND FARM ENVIRONMENTS USING AN EXPANDED VERSION OF THE SNLWIND (VEERS) TURBULENCE CODE

N. D. Kelley Nov. 1992 10 p Presented at the 12th American Society Mechanical Engineers Wind Energy Symposium, Houston, TX, 31 Jan. - 4 Feb. 1993

(Contract DE-AC02-83CH-10093)

(DE93-000041; NREL/TP-442-5225; CONF-930153-2) Avail: CASI HC A02/MF A01

We have recently expanded the numerical turbulence simulation (SNLWIND) developed by Veers to include all three components of the turbulent wind vector. We have also configured the code to simulate the characteristics of turbulent wind fields upwind and downwind of a large wind farm, as well as over uniform, flat terrain. Veers's original method only simulates the longitudinal component of the wind in neutral flow. This paper overviews the development of spectral distribution, spatial coherence, and cross correlation models used to expired the SNLWIND code to include the three components of the turbulent wind over a range of atmospheric stabilities. These models are based on extensive measurements of the turbulence characteristics immediately upwind and downwind of a large wind farm in San Gorgonio Pass, California. DOE

AN OVERVIEW OF DOE'S WIND TURBINE DEVELOPMENT PROGRAMS

A. S. Laxson, S. M. Hock, W. D. Musial, and P. R. Goldman (Department of Energy, Washington, DC.) Dec. 1992 7 p Presented at the Windpower 1992, Seattle, WA, 19-23 Oct. 1992

(Contract DE-AC02-83CH-10093)

(DE93-000044; NREL/TP-441-5245; CONF-921049-8) Avail: CASI HC A02/MF A01

The development of technologically advanced, higher efficiency wind turbines continues to be a high priority of the US wind industry. The United States Department of Energy (DOE) is conducting and sponsoring a range of programs aimed at assisting the wind industry with system design, development, and testing. The overall goal is to develop systems that can compete with conventional electric generation at $0.05/kWh at 5.8 m/s (13 mph sites) by the mid-1990s, and with fossil-fuel-based generators $0.04/kWh at 5.8 m/s sites by the year 2000. These goals will be achieved through several programs. The Value Engineered Turbine (VET) Program will promote the rapid development of US capability to manufacture wind turbines to take advantage of near-term market opportunities. These value-engineered turbines will stem from units with known and well-documented records of performance. The Advanced Wind Turbine Program will assist US industry to develop and integrate advanced technologies into utility-grade wind turbines for the near term (1993-1995), and to develop a new generation of innovative turbines for the year 2000. The Utility Wind Turbine Performance Verification Program, a collaborative agreement between the Electric Power Research Institute (EPRI) and DOE, will deploy and evaluate commercial-prototype wind turbines in typical utility operating environments to provide a bridge from development programs currently under way to commercial purchases of utility-grade wind turbines. DEVELOPMENT OF CPG DISH-STIRLING SYSTEMS FOR REMOTE POWER APPLICATIONS

I. Kubo (Cummins Power Generation, Inc., Columbus, IN.) and R. B. Diver 1992 16 p Presented at the 6th International Symposium on Solar Thermal Concentrating Technologies, Mojacar, Spain, 25 Sep. - 2 Oct. 1992

(Contract DE-AC04-76DP-00789)

(DE93-003251; SAND-92-2123C; CONF-920938-3) Avail: CASI HC A03/MF A01

Through a program sponsored by the US Department of Energy (DOE), Cummins Power Generation, Inc. (CPG) and Sandia National Laboratories (SNL) have entered into a joint venture to develop and commercialize economically competitive dish-Stirling systems for remote power applications. Sixteen systems, representing three generations of technology, will be developed, fielded, and tested in the Dish-Stirling Joint Venture Program (JVP). The JVP is funded equally by a consortium led by CPG and by the DOE. After completion of the program, CPG's commercialization effort will continue with limited production expected to start in 1996. The program plan and the technology used in the JVP are outlined. The current status of the key system components, and the initial results of a system optimization study including current cost and performance estimates, are also provided. DOE

Ruffins (Astropower, Inc., Newark, DE.), and A. M. Barnett (Astropower, Inc., Newark, DE.) Dec. 1992 40 p

(Contract DE-AC04-76DP-00789)

(DE93-007420; SAND-92-7012) Avail: CASI HC A03/MF A01

The silicon-film design achieves high performance by using a dun silicon layer and incorporating light trapping. Optimally designed thin crystalline solar cells (less than 50 microns thick) have performance advantages over conventional thick devices. The high-performance silicon-film design employs a metallurgical barrier between the low-cost substrate and the thin silicon layer. Light trapping properties of silicon-film on ceramic solar cells are presented and analyzed. Recent advances in process development are described here. DOE

NON-PROPRIETARY STACK RESEARCH

C. Yuh Jul. 1992 13 p

(Contract DE-AC21-90MC-27168)

(DE93-007523; DOE/MC-27168/3188) Avail: CASI HC A03/MF A01

Ohmic resistance loss in a state-of-the-art carbonate fuel cell contributes about 65 mV loss at BOL (beginning-of-life). It may increase to about as much as 145 mV after 40,000 hours. Its reduction will offer further improvement in fuel cell power plant efficiency. The important resistance

contributing elements/interfaces are illustrated in Figure 1. The majority of the ohmic loss is attributed to electrolyte matrix (ionic) and cathode-side hardware (electronic). The ohmic loss due to electrodes and anode-side hardware can generally be neglected. The matrix ionic resistance is influenced by many factors: electrolyte conductivity, matrix porosity, tortuosity, electrolyte fill level and matrix thickness. At present, matrix contributes to greater than 300 m ohm cm(exp 2) (greater than 70 percent of the total cell ohmic resistance) and is the major resistance contributor. The oxide formed at the cathode-CCC (cathode current collector) interface is the major cause of the cathode-side hardware resistance (contributing about 60 m ohm cm(exp 2)). For carbonate fuel cell to be economically viable, a 40,000h life is needed. Therefore, resistance stability for such a long-term operation is very important. Based on the above discussion, more understanding on ohmic resistance, particularly its increase, is needed for better recommending approaches to further reduce the ohmic resistance.

BATTERY COMPATIBILITY WITH PHOTOVOLTAIC CHARGE CONTROLLERS
S. R. Harrington (Ktech Corp., Albuquerque, NM.) and W. I. Bower 1992 7 p Presented at the DOE Review/G-2 Experiment, Upton, NY, 14-15 Jan. 1992
(Contract DE-AC04-76DP-00789)
(DE93-005373; SAND-92-2501C; CONF-920152-2) Avail: CASI HC A02/MF A01

Photovoltaic (PV) systems offer a cost-effective solution to provide electrical power for a wide variety of applications, with battery performance playing a major role in their success. Some of the results of an industry meeting regarding battery specifications and ratings that photovoltaic system designers require, but do not typically have available to them are presented. Communications between the PV industry and the battery industry regarding appropriate specifications were uncoordinated and poor in the past. The effort under way involving the PV industry and battery manufacturers is discussed and a working draft of specifications to develop and outline the information sorely needed on batteries is provided. The development of this information is referred to as 'Application Notes for Batteries in Photovoltaic Systems.' The content of these 'notes' was compiled from various sources, including the input from the results of a survey on battery use in the photovoltaic industry. Only lead-acid batteries are discussed.

STABLE, HIGH-EFFICIENCY AMORPHOUS SILICON SOLAR CELLS WITH LOW HYDROGEN CONTENT
C. M. Fortmann and S. S. Hegedus Dec. 1992 70 p Prepared for Midwest Research Inst., Golden, CO
(Contract DE-AC02-83CH-10093)
(DE93-000049; NREL/TP-451-5191) Avail: CASI HC A04/MF A01

Results and conclusions obtained during the investigation of amorphous silicon, amorphous silicon based alloy materials, and solar cells fabricated by photo-chemical vapor and glow discharge depositions are reported. Investigation of the effects of the hydrogen content in a-Si:H i-layers in amorphous silicon solar cells show that cells with lowered hydrogen content i-layers are more stable. A classical thermodynamic formulation of the Staebler-Wronski effect has been developed for standard solar cell operating temperatures and illuminations. Methods have been developed to extract a lumped equivalent circuit from the current voltage characteristic of a single junction solar cell in order to predict its behavior in a multijunction device.

DAMPING MEASUREMENTS FROM AN OPERATING WIND TURBINE: PRELIMINARY RESULTS AND PROCEDURES
G. H. James and T. G. Carne 1992 24 p Presented at the 12th ASMEE Wind Energy Symposium, Houston, TX, 31 Jan. - 4 Feb. 1993
(Contract DE-AC04-76DP-00789)
(DE93-005357; SAND-92-1565C; CONF-930153-3) Avail: CASI HC A03/MF A01

The Natural Excitation Technique (NEXT) extracts modal parameters from structures undergoing some natural excitation in which no measure of the excitation force is available. Preliminary damping results are presented for the first blade flatwise modes of the Sandia/DOE 34-m Test Bed (a Vertical Axis Wind Turbine) as a function of both wind speed and tip speed ratio. The current data set is to sparse to show a trend between damping and wind speed; however, a trend of higher damping for higher tip speed ratio is apparent. An estimate of the uncertainty of the data is provided. Several improvements to NEXT have been added and are discussed in this paper. These improvements include: the use of a single software environment, the addition of the complex mode indicator function, the partial removal of harmonics, time and frequency domain cross-correlation function calculation, windowing, variable ensemble size capability, filtering and data decimation, and visual convergence checking.

LUNAR ELECTRIC POWER SYSTEMS UTILIZING THE SP-100 REACTOR COUPLED TO DYNAMIC CONVERSION SYSTEMS Final Report
Richard B. Harty and Richard E. Durand Mar. 1993 69 p
(Contract NAS3-25808)
(NASA-CR-191023; NAS 1.26:191023; Rept-93RC-02316) Avail: CASI HC A04/MF A01

An integration study was performed by Rocketdyne under contract to NASA-LeRC. The study was concerned with coupling an SP-0100 reactor to either a Brayton or Stirling power conversion system. The application was for a surface power system to supply power requirements to a lunar base. A power level of 550 kWe was selected based on the NASA Space Exploration Initiative 90-day study. Reliability studies were initially performed to determine optimum power conversion redundancy. This study resulted in selecting three operating engines and one stand-by unit. Integration design studies indicated that either the Brayton or Stirling power conversion systems could be integrated with the PS-100 reactor. The Stirling system had an integration advantage because of smaller piping size and fewer components. The Stirling engine, however, is more complex and heavier than the Brayton rotating unit, which tends to off-set the Stirling integration advantage. From a performance consideration, the Brayton had a 9 percent mass advantage, and the Stirling had a 50 percent radiator advantage.

A representative current state-of-the-art system using parabolic trough technology was developed using data from a system recently installed in Tehachapi, California. A simulation model was used to estimate the annual energy output from the system at three different insolation locations. Based on discussions with industry personnel and within NREL, we identified a number of technology improvements that offer the potential for increasing the energy performance and reducing the energy-cost of the baseline system. The technology improvements modeled included an evacuated-tube receiver, an antireflective coating on the receiver tube, an improved absorber material, a cleaner reflecting surface, a reflecting surface that can withstand contact cleaning, and two silver reflectors. The properties associated with the improvements were incorporated into the model simulation at the three

insolation locations to determine if there were any performance gains. The results showed that there was a potential for a more than 50 percent improvement in the annual energy delivered by a 2677 sq m system incorporating a combination of the enumerated technology improvements. We discuss the commercial and technological status of each design improvement and present performance predictions for the trough-design improvements. DOE

PROCEEDINGS OF THE FOURTH ANNUAL FUEL CELLS CONTRACTORS REVIEW MEETING

W. J. Huber, ed. Jul. 1992 176 p Meeting held in Morgantown, WV, 14-15 Jul. 1992

(DE92-001290; DOE/METC-92-6127; CONF-920748) Avail: CASI HC A09/MF A02

The objective of the program was to develop the essential technology for private sector commercialization of various fuel cell electrical generation systems, which promise high fuel efficiencies (40-60 percent), possibilities for cogeneration, modularity, possible urban siting, and low emissions. The purpose of this meeting was to provide the R and D participants in the DOE/Fossil Energy-sponsored Fuel Cells Program with a forum. With the near commercialization of phosphoric acid fuel cells, major emphasis was on molten carbonate and solid oxide fuel cells. Twenty-two papers were given in 3 formal sessions: molten carbonate fuel cells; solid oxide fuel cells; and systems and phosphoric acid. In addition, the proceedings also include a welcome to METC address and comments on the Fuel Cells Program from the viewpoint of EPRI and DOE's Vehicular Fuel Cell Program. Separate abstracts have been prepared. DOE

PHOTOVOLTAIC EVALUATION STUDY

G. Johnson, M. Heikkilae, T. Melasuo, and S. Spanner 1992 204 p

(DE93-761330; IVO-A-03/92) Avail: CASI HC A10/MF A03

Realizing the value and potential of PV-power as well as the growing need for increased cooperation and sharing of knowledge in the field of photovoltaics, FINNIDA and UNICEF decided to undertake a study of selected PV-projects. There were two main objectives for the study: To gather, compile, evaluate and share information on the photovoltaic technology appropriate to developing countries, and to promote the interest and competence of Finnish research institutes, consultants and manufacturers in photovoltaic development. For this purpose a joint evaluation of significant, primarily UN-supported projects providing for the basic needs of rural communities was undertaken. The Gambia and Kenya offered a variety of such projects, and were chosen as target countries for the study. The projects were chosen to be both comparable and complimentary. In the Gambia, the main subject was a partially integrated health and telecommunications project, but a long-operating drinking water pumping system was also studied. In Kenya, a health project in the Turkana area was examined, and also a large scale water pumping installation for fish farming. Field visits were made in order to verify and supplement the data gathered through document research and earlier investigations. Individual data gathering sheets for the project form the core of this study and are intended to give the necessary information in an organized and accessible format. The findings could practically be condensed into one sentence: PV-systems work very well, if properly designed and installed, but the resources and requirements of the recipients must be considered to a higher degree. FUTURE TRENDS IN POWER GENERATION COST BY POWER RESOURCE

25 Aug. 1992 28 p

(DE93-761825; ETDE/JP-MF-93761825) Avail: CASI HC A03/MF A01

The Japan Energy Economy Research Institute has been evaluating power generation cost by each power resource every year focusing on nuclear power generation. The Institute is surveying the cost evaluations by power resources in France, Britain and the U.S.A., the nuclear generation advanced nations. The OECD is making power generation cost estimation using a hypothesis which uniforms basically the conditions varying in different member countries. In model power generation cost calculations conducted by the Ministry of International Trade and Industry of Japan, nuclear power generation is the most economical system in any fiscal year. According to recent calculations performed by the Japan Energy Economy Research Institute, the situation is such that it is difficult to distinguish the economical one from others among the power generation systems in terms of generation costs except for thermal power generation. Economic evaluations are given on estimated power generation costs based on construction costs for nuclear and thermal power plants, nuclear fuel cycling cost, and fuel cost data on petroleum, LNG and coal. With regard to the future trends, scenario analyses are made on generation costs, that assume fluctuations in fuel prices and construction costs, the important factors to give economic influence on power generation. DOE

INVESTIGATION AND STUDY SCENARIOS TO INTRODUCE CO2 FIXATION TECHNOLOGIES IN THE ENERGY SECTOR

Mar. 1992 103 p

(DE93-761912; NEDO-ITE-9103) Avail: CASI HC A06/MF A02

The ultimate target of the study is to develop models which can evaluate scenarios for the future development of CO2 fixation technology from the aspect of its effect on Japan's energy supply/ demand structure and the CO2 reduction effect. An outline model is built and operated to study the function. Using the linear programming, the model is developed which can numerically grasp the effects of the following items on the energy supply/demand structure: energy supply, introduction of new energy, energy conservation measures, restrictions on CO2 emissions, introduction of CO2 emission penalty, introduction of CO2 fixation technologies, energy supply costs, etc. Estimation is trially made for 6 cases, that is, 3 cases each in 2000 and 2010; standard case (A), CO2 emission penalty case (B) and CO2 emission restrictions case (C), using one-year calculation in 2000 and 2010. CO2 fixation technology in volume to be introduced in 2000 is 40,000C tons (B) and 120,000C tons (C) in the electric utility industry, and 32,000C tons (B) and 92,000C tons (C) in the industry except electric utility. In case C, in particular, the gross CO2 emission from the primary energy to be selected for supply is with in 280 million tons. This is the same as in 2010. DOE

EVALUATION OF DIURNAL THERMAL ENERGY STORAGE COMBINED WITH COGENERATION SYSTEMS

S. Somasundaram, D. R. Brown, and M. K. Drost Nov. 1992 40 p

(Contract DE-AC06-76RL-01830)

(DE93-004798; PNL-8298) Avail: CASI HC A03/MF A01

This report describes the results of an evaluation of thermal energy storage (TES) integrated with simple gas turbine cogeneration systems. The TES system captures and stores thermal energy from the gas turbine exhaust for immediate or future generation of process heat. Integrating thermal energy storage with conventional cogeneration equipment increases the initial cost of the combined system; but, by decoupling electric power and process heat production, the system offers the following significant advantages: (1) electric power can be generated on demand, irrespective of the process heat load profile, thus increasing the value of the power produced; (2) although supplementary firing could be used to serve independently varying electric and process heat loads, this approach is inefficient. Integrating TES with cogeneration can serve the two independent loads while firing all fuel in the gas turbine. The study evaluated the cost of power produced by cogeneration and cogeneration/TES systems designed to serve a fixed process steam load. The value of the process steam was set at the levelized cost estimated for the steam from a conventional stand-alone boiler. Power costs for combustion turbine and combined-cycle power plants were also calculated for comparison. The results indicated that peak power production costs for the cogeneration/TES systems were between 25 and 40 percent lower than peak power costs estimated for a combustion turbine and between 15 and 35 percent lower than peak power costs estimated for a combined-cycle plant. The ranges reflect differences in the daily power production schedule and process steam pressure/temperature assumptions for the cases evaluated. Further cost reductions may result from optimization of current cogeneration/TES system designs and improvement in TES technology through future research and development. DOE

A SUMMARY OF RECENT ACTIVITIES AT THE NATIONAL SOLAR THERMAL TEST FACILITY
C. P. Cameron 1992 17 p Presented at the International American Society of Mechanical Engineers/ASES (ASME/ASES) Joint Solar Energy Conference, Washington, DC, 4-9 Apr. 1993
(Contract DE-AC04-76DP-00789)
(DE92-040969; SAND-92-1348C; CONF-930435-1) Avail: CASI HC A03/MF A01

The United States Department of Energy's National Solar Thermal Test Facility (NSTTF), located at Sandia National Laboratories in Albuquerque, New Mexico, is the major facility for testing of solar thermal components and systems in the United States. Since originally being constructed as the Central Receiver Test Facility in the late 1970's, its mission has been expanded to include distributed receiver technologies, and it now includes line-focus and point-focus collectors, two solar furnaces, and an engine test facility. In addition, the unique capabilities of the facility have been applied to a wide variety of tests unrelated to solar energy, but using the intense heat from concentrated solar radiation or using the large-scale optical systems at the site. In this paper, current activities at the NSTTF are summarized, with an emphasis on activities that have not been described elsewhere. DOE

HEAT PUMP TECHNOLOGY: RESPONDING TO NEW OPPORTUNITIES
V. D. Baxter, F. A. Creswick, and W. K. Snelson 1993 21 p Presented at the 4th International Energy Agency Heat Pump Conference: Heat Pump for Energy Efficiency and Environmental Progress, Maastricht, Netherlands, 26-29 Apr. 1993
(Contract DE-AC05-84OR-21400)
(DE93-005939; CONF-930427-1) Avail: CASI HC A03/MF A01

This paper provides an update on advanced heat pump research and development activities in the United States and Canada. These research programs are directed toward the development of viable alternatives to HCFC-22 for heat pump and air-conditioning applications. The HCFC phaseout provides an opportunity to develop advanced refrigeration equipment for the new refrigerants which has higher energy efficiency than current heat pump systems. Programs are underway in both industry and government laboratories and are characterized by close collaboration between major manufacturers and government agencies to plan and execute the research. Under the general area of thermally activated heat pump technology, there are several cooperative early-commercialization activities being conducted on gas-fired heat pumps and chillers by government, HVAC industry, and gas utility organizations. DOE

AN ENVIRONMENTAL RATING FOR HEAT PUMP EQUIPMENT
P. J. Hughes 1992 15 p Presented at the Canada/United States Joint Workshop on Heat Pump Standards for Performance Rating, Toronto, Ontario, 7-8 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-004526; CONF-921238-1) Avail: CASI HC A03/MF A01

The major federal and state regulatory trends that may affect heat pump markets are reviewed. Then the confluence of federal and state regulation, and what it may mean for heat pump markets, is discussed. The conclusion reached, and therefore the assumption for the rest of the paper, is that state regulators will increasingly be managing the environmental impacts associated with alternative heating, cooling, and water heating methods within the framework of Integrated Resource Planning (IRP). The input needs of IRP are reviewed, and some shortcomings of existing rating procedures for providing the IRP inputs are identified. Finally, the paper concludes with a brief suggestion on course of action. DOE

GRIDDED STATE MAPS OF WIND ELECTRIC POTENTIAL
M. N. Schwartz, D. L. Elliott, and G. L. Gower Oct. 1992 10 p Presented at the Windpower 1992, Seattle, WA, 19-23 Oct. 1992
(Contract DE-AC06-76RL-01830)
(DE93-004556; PNL-SA-21320; CONF-921049-7) Avail: CASI HC A02/MF A01

Estimates of wind electric potential and available windy land area in the contiguous United States, calculated in 1991, were revised by incorporating actual data on the distribution of environmental exclusion areas where wind energy development would be prohibited or severely restricted. The new gridded data base with actual environmental exclusion areas, in combination with a 'moderate' land-use scenario, is the basis for developing the first gridded maps of available windy land and wind electric potential. Gridded maps for the 48 contiguous states show the estimated windy land area and electric potential for each grid cell (1/40 latitude by 1/30 longitude). These new maps show the distribution of the estimated wind electric potential and available windy land within an individual state, unlike previous national maps that only show estimates of the total wind electric potential for the state as a whole. While changes for some individual states are fairly large (in percentage), on a national basis, the estimated windy land area and wind electric potential are only about 1 - 2 percent higher than estimated in 1991. DOE

CHANGES IN IMPEDANCE OF Ni/Cd CELLS WITH VOLTAGE AND CYCLE LIFE
Margaret A. Reid Jul. 1992 12 p Presented at the Second International Symposium on Electrochemical Impedance Spectroscopy, Santa Barbara, CA, 12-17 Jul. 1992; sponsored by the Pennsylvania State Univ.
(RTOP 323-57-4B)
(NASA-TM-106105; E-7688; NAS 1.15:106105) Avail: CASI HC A03/MF A01

Impedances of aerospace design Super Ni/Cd cells are being measured as functions of voltage and number of cycles. The cells have been cycled over 4400 cycles to date. Analysis of the impedance data has been made using a number of equivalent circuits. The model giving the best fit over the whole range of voltage has a parallel circuit of a kinetic resistance and a constant phase element in series with the ohmic resistance. The values for the circuit elements have been treated as empirical parameters, and no attempt has been made as yet to correlate them with physical and chemical changes in the electrode. No significant changes have been seen as yet with the exception of a decrease in kinetic resistance at low states of charge in the first 500 cycles. Author

DESIGN OF GASIFIERS TO OPTIMIZE FUEL CELL SYSTEMS
Apr. 1992 11 p
(Contract DE-AC21-90MC-27227)
(DE93-000219; DOE/MC-27227/3135) Avail: CASI HC A03/MF A01

Phase 1 of Task 4.2 began this quarter with TGA testing of limestone, taconite, and K2CO3 as a gasification catalysts with Illinois No. 6 coal. These tests are designed to compare the reactivities of these catalysts using Illinois No. 6 coal. In all cases, the molar equivalent ratioof catalyst to fixed carbon was 0.12, so that for K(+) the molar ratio was K/FC = 0.12, for Ca(2+) = 0.06, and for Fe(3+) = 0.04 mols/mol. In this way the active sites on the coal structure (-COO(-)) are exposed to the same number of possible connections with mobile cations regardless of the choice of metallic element. The proximate analyses of the catalyzed samples and raw coal are shown. The TGA tests used a dry form of each catalyst at temperatures ranging from 700 to 800 C. Analysis of the data reveals that dry taconite alone provides essentially no catalytic activity. Dry limestone provides a slight improvement in reactivity; however this improvement is insignificant in comparison to the high reactivities obtained with a potassium catalyst. An impregnated potassium catalyst, introduced as a wood ash

leachate, was also tested. The negligible difference in reactivities of wood ash leachate and K2CO3 indicate that the potassium is as mobile dry, as it is impregnated, and therefore its chemical form is not a crucial issue. Further TGA testing is being conducted using Illinois No. 6 coal char impregnated with soluble Ca(2+) and Fe(3+.) By using soluble forms of the catalysts, more intimate contact between the coal and catalyst is expected. This may increase apparent reactivity. DOE

THE WESTINGHOUSE SOLID OXIDE FUEL CELL PROGRAM: CLEAN, EFFICIENT ENERGY FOR THE FUTURE

G. B. Gockley 1992 8 p Presented at the 9th Annual International Pittsburgh Coal Conference, Pittsburgh, PA, 12-16 Oct. 1992

(Contract DE-FC21-91MC-28055)

(DE93-003487; DOE/MC-28055/93/C0134; CONF-921037-9) Avail: CASI HC A02/MF A01

This paper provides an overview of the Westinghouse tubular SOFC technology and field testing program. The development program for the field testing was initiated in 1986 with a 400 W unit. This program has progressed to the installation and start-up in early 1992 of the 25 kill field unit at Rokko Island in Japan. In mid-1992 the second 25 kill field unit, a cogeneration system producing both ac electric power and intermediate pressure steam, will be delivered to the Joint Gas Utilities, a consortium of the Tokyo Gas Company and the Osaka Gas Company. This will be followed by the 20 kill SOFC unit to be supplied to Southern California Edison in early 1993. Future plans include the 100 kill Cogeneration Proof-of-Concept unit for the Southern California Gas Company which is scheduled for delivery in late 1993. Applications for SOFC technology range from on-site power generation for commercial second small industrial applications to dispersed generating plants and central station electric power generation. The design studies have included integrated coal gasification SOFC-steam turbine power plants. Installed capital costs of a 250 MW plant of this configuration compares favorably with the integrated coal gasification combined cycle plants. DOE

MONOLITHIC, SERIES CONNECTED GaAs PHOTOVOLTAIC POWER CONVERTERS FOR OPTOELECTRONIC COMPONENT APPLICATIONS

B. H. Rose Sep. 1992 91 p

(Contract DE-AC04-76DP-00789)

(DE93-004385; SAND-92-1534) Avail: CASI HC A05/MF A01

This report describes the features of monolithic, series connected photovoltaic converters which have been developed for applications where voltages are required that are higher than available using conventional single junction solar cells. These devices are intended to play a significant role in advanced weapon systems development. They are also appropriate for any other applications where electric power is needed in remote regions and electrical connection to the region is deemed detrimental for whatever reasons. Development of this technology at two outside contractors has been accomplished through competitive procurement in response to an internally generated Statement of Work. Detailed comparisons are made of data taken from converters of each type from both contractors. The primary advantage of these converters is that they are high voltage/low current devices compared to conventional single junction solar cells. This allows them to directly drive a wider range of loads without the necessity of power conditioning, such as provided by a transformer. Discussions of load analysis for given applications are included. DOE

THE PHOTOVOLTAIC MANUFACTURING TECHNOLOGY PROJECT, PHASE 1

Jul. 1992 9 p

(Contract DE-AC02-83CH-10093)

(DE92-010597; NREL/MK-411-4973-Phase-1) Avail: CASI HC A02/MF A01

The Phase 1 portion of the Photovoltaic Manufacturing Technology (PVMaT) Project, the problem identification phase, was completed in mid-1991. This work involved competitive bidding that was open to any U.S. firm with existing manufacturing capabilities, regardless of material or module design. In early 1991, subcontracts were awarded to 22 of approximately 40 bidders. Each subcontract was funded at a level of up to $50,000 and a duration of three months. The problems identified by the research in this phase of the program represent opportunities for industrial participants to improve their manufacturing processes, reduce manufacturing costs, increase product performance, or develop a foundation for scaling up U.S.-based manufacturing plant capacities. Many of these opportunities have since been detailed in the approaches that these organizations suggested for Phase 2 (the problem solution phase) research and development (R&D). It is not anticipated that any additional Phase 1 solicitation will be issued because Phase 1 was intended to help the U.S. Department of Energy (DOE) characterize the status and needs of the U.S. photovoltaic (PV) industry and encourage the industry to examine and prioritize required manufacturing line improvements. Phase 1 subcontracted research included five subcontractors working on flat-plate crystalline silicon technology, eleven working on flat-plate thin-film modules (one in thin-film crystalline silicon, six in amorphous silicon. and four in polycrystalline thin films), six working on concentrator systems, and two working on general equipment/production options. (Two of the participants each worked in two areas). DOE

PHOTOVOLTAICS PERFORMANCE AND RELIABILITY WORKSHOP

L. Mrig, ed. 1992 527 p Workshop held in Golden, CO, 16-18 Sep. 1992

(Contract DE-AC02-83CH-10093)

(DE93-000017; NREL/CP-411-5184; CONF-9209252) Avail: CASI HC A23/MF A04

This document consists of papers and viewgraphs compiled from the proceedings of a workshop held in September 1992. This workshop was the fifth in a series sponsored by NREL/DOE under the general subject areas of photovoltaic module testing and reliability. PV manufacturers, DOE laboratories, electric utilities, and others exchanged technical knowledge and field experience. The topics of cell and module characterization, module and system performance, materials and module durability/reliability research, solar radiation, and applications are discussed. DOE

EVALUATION OF SOLAR RADIATION MEASUREMENT SYSTEMS: EPRI/NREL Final Test Report

T. Stoffel, C. Riordan, and J. Bigger Nov. 1992 63 p

(Contract DE-AC02-83CH-10093)

(DE93-000020; NREL/TP-463-4771) Avail: CASI HC A04/MF A01

Measured solar radiation resource data are needed by electric utilities to evaluate the potential of renewable energy options like photovoltaics in their service territory. In this final test report, we document a cooperative project of the Electric Power Research Institute (EPRI) and the National Renewable Energy Laboratory (NREL) to compare available measurement system options for performing solar radiation resource assessments. We present the detailed results of a 6-month field comparison of thermopile-based pyranometer and pyrheliometer solar irradiance measurement systems with two different implementations of the rotating shadowband radiometer (RSR) concept installed at NREL's Solar Radiation Research Laboratory (SRRL) in Golden, Colorado. FATIGUE AND RELIABILITY ANALYSES FOR WIND TURBINES

H. J. Sutherland 1992 10 p Presented at the Fatigue Experts Conference, Golden, CO, 15 Oct. 1992

(Contract DE-AC04-76DP-00789)

(DE93-004497; SAND-92-2480C; CONF-9210253-1) Avail: CASI HC A02/MF A01

This paper presents a summary of two areas of research into the fatigue of wind turbine components at Sandia National Laboratories. The first area is the fatigue analysis of turbine components and the second is reliability analysis. For the former, current work is addressing the examination of experimental data in the time and frequency domain. Emphasis in this paper is directed at the determination of the 'high-stress' tail of the cycle count distribution. For the reliability analysis, research is quantifying the uncertainties and the inherent randomness associated with turbine performance and the prediction of service lifetimes. Both research areas are highlighted with typical results. DOE

HEAT PIPE FATIGUE TEST SPECIMEN: METALLURGICAL EVALUATION Topical Report, Oct. 1990 - 1991
Steven E. Walak, Michael J. Cronin, and Toni Grobstein (National Aeronautics and Space Administration. Lewis Research Center, Cleveland, OH.) Jan. 1992 37 p
(Contract NAS3-25463; RTOP 583-02-21)
(NASA-CR-189120; NAS 1.26:189120; MTI-91TR56) Avail: CASI HC A03/MF A01

An innovative creep/fatigue test was run to simulate the temperature, mechanical load, and sodium corrosion conditions expected in a heat pipe designed to supply thermal energy to a Stirling cycle power converter. A sodium-charged Inconel 718 heat pipe with a Nickel 200 screen wick was operated for 1090 hr at temperatures between 950 K (1250 F) and 1050 K (1430 F) while being subjected to creep and fatigue loads in a servo-hydraulic testing machine. After testing, the heat pipe was sectioned and examined using optical microscopy, scanning electron microscopy, and electron microprobe analysis with wavelength dispersive x-ray spectroscopy. The analysis concentrated on evaluating topographic, microstructural, and chemical changes in the sodium exposed surfaces of the heat pipe wall and wick. Surface changes in the evaporator, condenser, and adiabatic sections of the heat pipe were examined in an effort to correlate the changes with the expected sodium environment in the heat pipe. This report describes the setup, operating conditions, and analytical results of the sodium heat pipe fatigue test. Author (revised)

SOLAR PUMPING: AN INTRODUCTION AND UPDATE ON THE TECHNOLOGY, PERFORMANCE, COSTS, AND ECONOMICS
Roy Barlow, Bernard McNelis, and Anthony Derrick 1993 164 p
(World Bank TP-168; ISBN-0-8213-2101-3; LC-92-21847) Copyright Avail: CASI HC A08; paper copy available from World Bank Publications, PO Box 7247-8619, Philadelphia, PA 19170-8619

Although the number of units in the field is still small, solar photovoltaic (PV) powered pumping systems offer many advantages over the more traditional technologies. Because there are few moving parts, maintenance is reduced to a minimum, and reliability is very high. Also, because the time of greatest water demand usually coincides with the maximum daily solar energy, the available pumping power is well matched to the demand. This guide is written for the potential user to give a simple background to PV pumping technology and to help to identify the situations in which solar pumping should be considered. The early chapters act as a guide to those unfamiliar with PV pumping, illustrating typical applications, and reviewing current technology. Following this are sections dealing with the range of currently available equipment and examining experience in the field. The final four sections cover the practical aspects of choosing a pumping system. This includes site evaluation and system sizing, a simple methodology for an economic assessment, and advice on procurement, installation, and maintenance. GRA

STATUS REPORT ON RENEWABLE ENERGY IN THE STATES
B. Swezey and K. Sinclair Dec. 1992 100 p
(Contract DE-AC02-83CH-10093)
(DE93-000032; NREL/TP-462-5175) Avail: CASI HC A05/MF A02

As the concept of integrated resource planning has spread among states and utilities, a reexamination of the role of renewable energy sources in the utility resource mix is taking place. This report documents the findings of a study of state regulatory commissions undertaken to: (1) help assess the state of knowledge and awareness about renewable energy resources and technologies; (2) assess the impacts of state policies on renewable energy development; and (3) identify important information needs. The key findings from this effort are: Renewable energy development has occurred only slowly over the last decade, and a small number of states account for the bulk of development. The development that has occurred has been limited to non-utility entities. Directed state policies have been a key driver in renewable energy development. Those states not currently addressing renewables may need more data and information before they proceed with directed policies. Other important observations are: The cost of renewables is an overriding concern. Regulators distinguish between 'emerging' and 'established' renewable energy technologies. Specific data are lacking on state-level renewable energy development. Detailed renewable resource assessments have yet to be performed in many states. This report identifies renewable energy information needs of state regulators. However, a number of concerns are also identified that must be addressed before renewables will receive serious attention in many of those states with limited renewables experience. Finally, the report catalogs a wide variety of policies that have been utilized in the states to promote greater development of renewable energy. DOE

NEW 3-5 CELL DESIGN APPROACHES FOR VERY HIGH EFFICIENCY
M. S. Lundstrom, M. R. Melloch, G. B. Lush, G. J. OBradovich, and M. P. Young Jan. 1993 53 p Prepared in cooperation with Purdue Univ., Lafayette, IN
(Contract DE-AC02-83CH-10093)
(DE92-010558; NREL/TP-451-4851) Copyright Avail: CASI HC A04/MF A01

This report describes progress during the first year of a three-year project. The objective of the research is to examine new design approaches for achieving very high conversion efficiencies. The program is divided into two areas. The first centers on exploring new thin-film approaches specifically designed for III-V semiconductors. The second area centers on exploring design approaches for achieving high conversion efficiencies without requiring extremely high quality material. Research activities consisted of an experimental study of minority carrier recombination in n-type, metal-organic chemical vapor deposition (MOCVD)-deposited GaAs, an assessment of the minority carrier lifetimes in n-GaAs grown by molecular beam epitaxy, and developing a high-efficiency cell fabrication process. A REVIEW OF THE EXPERIENCE GAINED IN 10 YEARS OPERATION OF GOULD'S SOLAR INDUSTRIAL PROCESS HEAT SYSTEM
D. C. Knipfer (Gould Electronics, Inc., Chandler, AZ.) and D. Menicucci 1992 7 p Presented at the International American Society of Mechanical Engineers/ASES (ASME/ASES) Joint Solar Energy Conference, Washington, DC, 4-9 Apr. 1993
(Contract DE-AC04-76DP-00789)
(DE93-003991; SAND-92-2481C; CONF-930435-2) Avail: CASI HC A02/MF A01

For nearly 10 years, the Gould Electronics, Incorporated manufacturing plant in Chandler, Arizona, has been a model of how medium-temperature solar thermal energy systems can produce economical industrial process heat (IPH). In 1982, a solar IPH system was designed and built on the site by Solar Kinetics, Inc. The system has remained in operation and continues to provide economical process heat for Gould's copper foil manufacturing operation. System performance and availability has fluctuated over the years, reaching a low point in early 1990 when the system was nearly inoperative because of equipment reliability problems. Gould teamed with engineers from Sandia National Laboratories' (Sandia) Solar Thermal Design Assistance Center to develop a plan to solve the technical problems and refurbish the field. The IPH system is currently operating at over 90-percent equipment availability, returning to Gould a net energy cost savings on the order of $7,500 per month. This paper presents the history and operation of the system from the perspective of the end user and describes the phased upgrade program undertaken with Sandia to refurbish the system. DOE

SOLAR-POWERED LIGHT EMITTING DIODE POWER LINE AVOIDANCE MARKER DESIGN Final Report
Ellen H. Snook, Clarence E. Rash, John S. Martin, Richard R. Levine, and Parley P. Johnson Dec. 1992 33 p
(AD-A259886; USAARL-93-6) Avail: CASI HC A03/MF A01

In-flight wire strikes are a constant threat to U.S. Army Aviation during all-weather, daytime and nighttime helicopter operations. Despite routine training on wire avoidance techniques, wire strikes continue to occur, with a majority of the mishaps historically occurring during training and maneuvering over familiar sites. In an effort to increase the conspicuity of suspended cables and wires, the aviation training community at Fort Rucker, Alabama, currently employs a passive wire marking system which consists of international-orange colored spheres suspended from cables and wires in heavily trafficked airspace. During a previous evaluation of wire marker

visibility, a solar-powered wire marker design was developed. This new design incorporates retroreflective material and light emitting diodes (LED's) to provide greater range visibility and detectability during aided and unaided flight. GRA

SURVEY OF THE HOKKAIDO DEVELOPMENT PROJECT
Mar. 1992 301 p
(DE93-761804; ETDE/JP-MF-93761804) Avail: CASI HC A14/MF A03

As a part of the survey of the Hokkaido development project, geothermal resources and mineral resources are investigated in the north area of Tokachi. The temperature of geothermal water is 45-77 C in the bottom of the mines of which the depth is 1000-1300 m. Application fields of geothermal water are space heating, heat source for fishery facilities, bathing, etc. Presently it is used in 10 bathing places, 10 space heating facilities and 11 agricultural and fishery facilities. It is used mostly for public facilities and will be effective for general house hot water supply and preparation of sightseeing places in the future. As measures for effective utilization, hydrothermal systems used in health community plaza, horticultural greenhouse and general house hot water supply are designed, and great effectness in energy saving and economy is indicated. There exist zeolite deposits which produce 7000 tons/year in the Seta area of Kami-Shihoro-cho surveyed. Minable amount of zeolite in the Kami-Shihoro area is estimated at 800,000 m(sup 3). Production of natural zeolite in Japan is 140,000 tons/year, which is used mostly for agricultural soil conditioner and also for industrial drying, adsorptional separation and water treatment. With the expanding utilization field, it is expected to contribute to activation of the regional economy. DOE

SUPPLY OF GEOTHERMAL POWER FROM HYDROTHERMAL SOURCES: A STUDY OF THE COST OF POWER IN 20 AND 40 YEARS
Susan Petty (Petty, Susan Consulting, Solano Beach, CA.), B. J. Livesay (Livesay Consultants, Inc., Encinitas, CA.), W. P. Long (Carlin Gold Co., Inc., Grass Valley, CA.), and John Geyer (Geyer, John and Associates, Vancouver, WA.) Nov. 1992 118 p
(Contract DE-AC04-76DP-00789)
(DE93-004479; SAND-92-7302) Avail: CASI HC A06/MF A02

This study develops estimates for the amount of hydrothermal geothermal power that could be on line in 20 and 40 years. This study was intended to represent a 'snapshot' in 20 and 40 years of the hydrothermal energy available for electric power production should a market exist for this power. This does not represent the total or maximum amount of hydrothermal power, but is instead an attempt to estimate the rate at which power could be on line constrained by the exploration, development and support infrastructure available to the geothermal industry, but not constrained by the potential market for power. DOE

FUNDAMENTAL DESIGN AND NUMERICAL SIMULATION OF THE NONSTEADY BEHAVIOR OF A SOLAR-DYNAMIC POWER MODULE FOR SPACE APPLICATIONS Ph.D. Thesis - Stuttgart Univ.
[AUSLEGUNGSGRUNDLAGEN UND NUMERISCHE SIMULATION DES INSTATIONAEREN BETRIEBSVERHALTENS EINES SOLARDYNAMISCHEN ENERGIEVERSORGUNGSMODULS FUER RAUMFAHRTMISSIONEN]
Berthold Oberle Apr. 1992 199 p In GERMAN
(DLR-FB-92-09; ETN-93-93524) Avail: CASI HC A09/MF A03; DLR, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

The nonsteady thermodynamic behavior of a solar-dynamic power module during the flight in the low Earth orbit is numerically simulated and investigated. For the thermal power process, a real Joule process is considered with a single stage compressor, a single stage turbine, and a partial regeneration. Irreversibilities in the different steps of the thermodynamic process are taken into account. For heat generation, a heatpipe receiver with integrated latent heat storage is simulated. A heatpipe radiator is modeled as the heat rejection system. In order to contribute to the nonsteady thermal boundary conditions, it is necessary to simulate the direct insolation, the albedo, and the thermal radiation of the Earth. Referring to the above mentioned key components, the complete solardynamic energy system is designed, calculated thermodynamically, and optimized with regard to maximum efficiency. Assuming four different and representative constellations of the orbit parameters and the sun vector, the dynamic behavior of the total system is analyzed. Adaptation to different energetic boundary conditions is carried out by regulation of the pressure level. The transient behavior of the solar dynamic energy system is analyzed for some postulated failure conditions. The results show that a well designed receiver storage system has enough inherent protection against overheating even in the event of a sudden failure of the receiver cooling. It is also proved that even a failure of half of the radiator area or a corresponding degradation of the radiator surfaces results in a slight reduced power output in the range of only 10 to 15 percent. (DE92-010563; NREL/TP-451-4850) Avail: CASI HC A04/MF A01

This project's objective is to improve our understanding of the generation, recombination, and transport of carriers within III-V homo- and heterostructures. The research itself consists of fabricating and characterizing solar cell 'building blocks' such as junctions and heterojunctions as well as basic measurements of material parameters. A significant effort is also being directed at characterizing loss mechanisms in high-quality, III-V solar cells fabricated in industrial research laboratories throughout the United States. The project's goal is to use our understanding of the device physics of high-efficiency cell components to maximize cell efficiency. A related goal is the demonstration of new cell structures fabricated by molecular beam epitaxy (MBE). The development of measurement techniques and characterization methodologies is also a project objective. This report describes our progress during the fifth and final year of the project. During the past five years, we've teamed a great deal about heavy doping effects

in p(sup +) and n(sup +) GaAs and have explored their implications for solar cells. We have developed an understanding of the dominant recombination losses in present-day, high-efficiency cells. We've learned to appreciated the importance of recombination at the perimeter of the cell and have developed techniques for chemically passivating such edges. Finally, we've demonstrated that films grown by molecular beam epitaxy are suitable for high-efficiency cell research. DOE

RECENT PROGRESS IN ZIRCONIA-BASED FUEL CELLS FOR POWER GENERATION

S. C. Singhal 1992 31 p Presented at the 5th International Conference on the Science and Technology of Zirconia, Melbourne, Australia, 16-21 Aug. 1992

(Contract DE-FC21-91MC-28055)

(DE93-003488; DOE/MC-28055/93/C0135; CONF-9208144-3) Avail: CASI HC A03/MF A01

High temperature solid oxide fuel cells based upon yttria-stabilized zirconia electrolyte offer a clean, pollution-free technology to electrochemically generate electricity at high 'efficiencies. This paper reviews the designs, materials, and fabrication processes used for such fuel cells. Most progress to date has been achieved with tubular geometry cells. A large number of tubular cells have been electrically tested, some to times up to 30,000 hours; these cells have shown excellent performance and performance stability. In addition, successiyely larger size electric generators utilizing these cells have been designed, built, and operated since 1984. Two 25 kW power generation field test units have recently been fabricated; these units represent a major milestone in the commercialization of zirconia-based fuel cells for power generation. DOE

NRC TWIN OTTER OPERATIONS IN THE 1991 CALIFORNIA OZONE DEPOSITION EXPERIMENT

J. I. MacPherson May 1992 213 p

(NRC-LTR-FR-118; CTN-93-60702) Avail: CASI HC A10/MF A03

In the summer of 1991, a 4-week international field experiment was conducted to measure ozone concentrations and fluxes in the San Joaquin Valley, California. The field data will be used to improve understanding of the exchange processes occurring between the atmosphere and various types of vegetation. The data will also be used to develop a comprehensive computer model for ozone transport and deposition in the valley. Canadian participation in this experiment comprised a series of low level flights, with repeated passes over agricultural sites (cotton, grapes, grassland, orchards, tomatoes), as well as regional-scale flights and higher-level soundings to document atmospheric conditions. Specific information is given on the aircraft instrumentation, software, recorded parameters, analysis procedures, data formats, flight characteristics, and data collected on fluxes of sensible and latent heat, CO2, momentum, and ozone. The highest ozone deposition velocities were measured over corn and cotton sites. A correlation is suggested between the measured greenness index and the ozone deposition velocity; this relationship is almost independent of the type of vegetation overflown. This in turn suggests a method for characterizing the deposition velocities for the entire valley using remotely sensed data from satellites. CISTI

THE FINNISH RESEARCH PROGRAMME ON CLIMATE CHANGE Progress Report

Markku Kanninen, ed. and Pia Anttila, ed. 1992 310 p

(DE93-752870; SA-PUB-3/92; ISBN-951-37-0846-1) Avail: CASI HC A14/MF A03

In 1989, the Ministry of Environment set up a committee to anaiyze our current knowledge on climatic changes and to define research needs related to the issue. The committee concluded its work by proposing that a large-scale multidisciplinary national research programme on climate change should be initiated. The committee defined the principal goals of the Finnish Research Programme on Climate Change (SILMU) as being to increase our knowledge on climate change, its causes, mechanisms and consequences; to strengthen the research on climate change in Finland; to increase the participation of Finnish researchers in international research programmes, and to prepare and disseminate information for policy makers on adaptation and mitigation. The key areas where research is to be directed are defined as: quantification of the greenhouse effect and the magnitude of anticipated climatic changes; assessment of the effects of changing climate on ecosystems, and development of mitigation and adaptation strategies. This volume comprises reports of the research projects included in SILMU. The aim of these reports is to describe the progress made in research during 1990-91, to illustrate the problem setting and lay out of the research work, and to present the results obtained. Due to the fact that most of the projects started in June 1990, only preliminary results can be presented at this stage. Future progress in SILMU will be reported periodically, with a final report being produced when the programme ends. DOE

CARBON DIOXIDE, CLIMATE, AND THE DEEP OCEAN CIRCULATION: CARBON CHEMISTRY MODEL

A. S. Menawat (Tulane Univ., New Orleans, LA.) 21 Sep. 1992 13 p

(Contract DE-FC03-90ER-61010)

(DE93-005061; DOE/ER-61010/1) Avail: CASI HC A03/MF A01

The objective of this study was to investigate the role of oceanic carbon chemistry in modulating the atmospheric levels of CO2. It is well known that the oceans are the primary sink of the excess carbon pumped into the atmosphere since the beginning of the industrial period. The suspended particulate and the dissolved organic matters in the deep ocean play important roles as carriers of carbon and other elements critical to the fate of CO2. In addition, the suspended particulate matter provides sites for oxidation-reduction reactions and microbial activities. The problem is of an intricate system with complex chemical, physical, and biological processes. This report describes a methodology to describe the interconversions of different forms of the organic and inorganic nutrients, that may be incorporated in the ocean circulation models. Our approach includes the driving force behind the transfers in addition to balancing the elements. Such thermodynamic considerations of describing the imbalance in the chemical potentials is a new and unique feature of our approach. DOE

A PROMPT START: IMPLEMENTING THE FRAMEWORK CONVENTION ON CLIMATE CHANGE

A. Chayes, E. B. Skolnikoff (Massachusetts Inst. of Tech., Cambridge.), and D. G. Victor (Massachusetts Inst. of Tech., Cambridge.) 1992 33 p Presented at the Institutional Aspects of International Cooperation on Climate Change, Bellagio, Italy, 28-30 Jan. 1992

(Contract DE-FC03-90ER-61010)

(DE93-005062; DOE/ER-61010/2; CONF-9201121-Summ) Avail: CASI HC A03/MF A01

A Framework Convention on Climate Change is under active negotiation in the United Nations with the expectation it will be ready for Signature at the Rio Conference this June. Under the most optimistic projections, a Convention will not come into force and be an effective instrument for months, probably years. In recognition of the several institutional tasks that will be of crucial importance whatever the detailed content of the Convention a small group of high international organizations involved in the negotiations was convened at the Rockefeller Foundation's Conference Center at Bellagio in January. The discussions at Bellagio on the need for a Prompt Start on these institutional tasks benefitted from earlier meetings at Harvard in March and at Bermuda in May, 1991, that the co-organizers convened to discuss these and related aspects of the negotiations on a Climate Convention. Those meetings were attended by members of the academic community, officials from the United Nations, and representatives of governments involved in the negotiations. DOE

ATMOSPHERIC SCIENCES PROGRAM
Nov. 1992 55 p
(DE93-004891; DOE/ER-0568T) Avail: CASI HC A04/MF A01

The mission of the Department's Environmental Processes and Effects Research (EPER) Program, in which the Atmospheric Science Program resides, is as follows: (1) quantify the physical, chemical, geological, and biological processes that transport, disperse, and transform energy-related materials in the atmosphere and in terrestrial and marine co-systems; (2) to determine the mechanisms of degradation and detoxification of hazardous energy related materials in the environment; and (3) to determine and manage the capacity for ecosystem adjustments to energy-related environmental stresses. This publication describes research on atmospheric chemistry. DOE

ENVIRONMENTAL PROJECTS. VOLUME 14: REMOVAL OF CONTAMINATED SOIL AND DEBRIS
Len Kushner 15 Mar. 1992 126 p
(Contract NAS7-918)
(NASA-CR-192803; NAS 1.26:192803; JPL-Publ-87-4) Avail: CASI HC A07/MF A02

Numerous diverse activities at the Goldstone Deep Space Communications Complex (GDSCC) are carried out in support of six parabolic dish antennas. Some of these activities can result in possible spills or leakages of hazardous materials and wastes stored both above ground in steel drums and below ground in underground storage tanks (UST's). These possible leaks or spills, along with the past practice of burial of solid debris and waste in trenches and pits, could cause local subsurface contamination of the soil. In 1987, the Jet Propulsion Laboratory (JPL), retained Engineering-Science, Inc. (E-S), Pasadena, California, to identify the specific local areas within the GDSCC with subsurface soil contamination. The E-S study determined that some of the soils at the Apollo Site and the Mars Site were contaminated with hydrocarbons, while soil at a nonhazardous waste dumpsite at the Mojave Base site was contaminated with copper. This volume is a JPL-expanded version of the PE209 E-S report, and it also reports that all subsurface contaminated soils at the GDSCC were excavated, removed, and disposed of in an environmentally acceptable way, and the excavations were backfilled and covered in accordance with accepted Federal, State, and local environmental rules and regulations. EXHAUST EMISSIONS FROM DIESEL ENGINES [DIESELMOOTTORIEN PAKOKAASUPAASTOT]
Juhani Laurikko 1992 51 p In FINNISH
(DE93-752852; VTT-JULK-761) Avail: CASI HC A04/MF A01

The amount and composition of exhaust emissions from diesel engines at cold-start and before reaching the normal running temperature were determined. Both direct injection and prechamber-type high-speed engines were studied. Experiments were carried out in the temperature range of (+)20 to (-)30 C, applying both constant and cyclic load during a half-an-hour test period. Emission test were also performed with the direct injection engine in accordance with the ECE R-49 regulation by keeping the engine at the running temperature and the ambient temperature lower than normal. All diesel fuels commercially available in Finland and one jet engine fuel, which is also suited for diesel engines, were used in the experiment. The measuring results indicated that the exhaust gas emissions from the direct injection engine change more than those from the precombustion chamber engine when the start-up and running temperatures decline. These differences may be due to differences in combustion chamber types. In the direct injection engine the emissions of carbon monoxide (CO) and unburnt hydrocarbons (HC) were increased by the decline in the start-up temperature, while the start-up temperature had only a minor effect on nitrogen oxide (NO(x)) emissions. There were only insignificant differences between the tested fuel grades. The low ambient temperature also affected the emissions of the warmed-up engine. The CO and HC emissions increased, dependent on the fuel used, 1.2 to 1.5-fold compared to those measured at a normal temperature, while the NO(x) emissions remained practically unchanged. In the direct injection engine, the formation of so-called white smoke was found to be intensive after the cold start-up. DOE

DEVELOPMENT OF SIZE-SPECIFIC DATA FROM PARTICULATE CONTROL TECHNOLOGY RESEARCH REPORTS Final Report, Mar. - Sep. 1992
T. Allen Dean, Michael R. J. Doorn, William R. Barnard, and Robert Coleman Nov. 1992 46 p Sponsored by Environmental Protection Agency
(Contract EPA-68-D9-0168)
(PB93-131456; EPA/600/R-92/214) Avail: CASI HC A03/MF A01

The report gives size-specific, uncontrolled emission factors and control efficiencies developed from many studies of particulate control device performance conducted under the direction of EPA's Air and Energy Engineering Research Laboratory (AEERL) between 1974 and 1981. The particle size ranges of concern are 02.5, 2.5-6, 6-10, and 0-10 micrometers. These data and the sampling and analysis procedures documented in the reports were subjected to a quality assurance review and then compared with source- and control-device-specific information in several data sources maintained by the EPA's Office of Air Quality Planning and Standards (OAQPS). Where no relevant information existed in these data sources, it was determined that the data developed from these studies should be incorporated into them. Each control device study is reviewed individually. For each study, the source, control device, and sampling configuration are described briefly, the quality of the sampling and analysis methods is rated informally, the data are compared with comparable AP-42 data, and conclusions are drawn regarding the need for the data in the OAQPS data sources. Reviews of documents which yielded data not suitable for inclusion in the OAQPS data sources are also included. GRA

AEROSOL PHASE TRANSFORMATION IN THE ATMOSPHERE
I. N. Tang and H. R. Munkelwitz Sep. 1992 5 p Presented at the 73rd AMS Annual Meeting, Anaheim, CA, 17-22 Jan. 1993
(Contract DE-AC02-76CH-00016)
(DE93-001903; BNL-47713; CONF-930133-4) Avail: CASI HC A01/MF A01

Ambient aerosols are frequently composed of hygroscopic inorganic salts such as chlorides, sulfates, and nitrates in either pure or mixed forms. Such inorganic salt aerosols exhibit the properties of deliquescence and efflorescence in air. The phase transformation from a solid particle to a saline droplet usually occurs spontaneously when atmospheric relative humidity reaches a level specific to the chemical composition of the aerosol particle. Conversely, when relative humidity decreases and becomes low enough, a saline droplet will evaporate and suddenly crystallize, expelling all its water content. Information on the composition and temperature dependence of these properties is required in mathematical models for describing the dynamic and transport behavior of ambient aerosols. Experiments are carried out in the temperature range 5-35 C, using single particles individually suspended in an electrodynamic cell that can be evacuated and back filled with water vapor. The phase transformation of the aerosol particle is monitored by laser light scattering and the relative humidity at the transition point is determined by directly measuring the water vapor pressure in the cell. Results are obtained for particles containing either a single salt or a preselected mixture of NaCl, KCl, NaNO3, Na2SO4) and (NH4)2SO4, which are common constituents of ambient aerosols. A theoretical model on the composition and temperature dependence of the deliquescence properties is developed for single and two-salt aerosol systems. DOE

GLOBAL WARMING IMPACTS OF CFC ALTERNATIVE TECHNOLOGIES: COMBINING FLUOROCARBON AND CO2 EFFECTS
P. D. Fairchild, S. K. Fischer, and P. J. Hughes 1992 14 p Presented at the International Energy Agency (IEA) Heat Pump Center Workshop, Merligen, Switzerland, 12-13 Oct. 1992
(Contract DE-AC05-84OR-21400)
(DE93-002347; CONF-9210198-1) Avail: CASI HC A03/MF A01

Chlorofluorocarbons (CFCs) are on their way out, due to their role in stratospheric ozone depletion and the related international Montreal Protocol agreement and various national phaseout timetables. As the research, engineering development, and manufacturing investment decisions have ensued to prepare for this transition away from CFCs, the climate change issue has emerged and there has recently been increased attention on

the direct global warming potential (GWP) of the fluorocarbon alternatives as greenhouse gases. However, there has been less focus on the indirect global warming effect arising from end-use energy changes and associated CO2 emissions. A study was undertaken to address these combined global warming effects. The concept of Total Equivalent Warming Impact (TEWI) was developed for combining the direct and indirect effects and was used for evaluating CFC-replacement options available in the required CFC transition time frame. Analyses of industry technology surveys indicate that CFC-user industries have made substantial progress toward near-equal energy efficiency with many HCFC/HFC alternatives. The findings also bring into question the relative importance of the direct effect in many applications and stress energy efficiency when searching for suitable CFC alternatives. For chillers, household refrigerators, and unitary air-conditioning or heat pump equipment, changes in efficiency of only 2-5 percent would have a greater effect on future TEWI than completely eliminating the direct effect. THE IMPLICATIONS OF CONCURRENT INCREASES IN TEMPERATURE AND CO2 CONCENTRATION FOR TERRESTRIAL C3 PHOTOSYNTHESIS
S. P. Long, G. Y. Nie, B. G. Drake (Smithsonian Institution, Edgewater, MD.), and G. Hendrey Sep. 1992 7 p Presented at the 9th International Congress on Photosynthesis, Nagoya, Japan, 30 Aug. - 5 Sep. 1992
(Contract DE-AC02-76CH-00016)
(DE93-005590; BNL-47781; CONF-9208155-4) Avail: CASI HC A02/MF A01

This study utilizes a mechanistic model of lea photosynthesis to examine the potential quantitative significance of the interaction of rising atmospheric. Carbon dioxide concentration (C(sub a)) and temperature on leaf photosynthesis. Predictions are compared to experimental measurements in which plants have been grown either in elevated C(sub a) in the field for extended periods or from seed in controlled environments, to examine the interaction of low temperature with elevated C(sub a). Three questions addressed were: To what extent will increase in C(sub a) modify the response of leaf photosynthetic CO2 uptake (A) to temperature; is the decrease in photosynthesis at sub-optimal temperatures predicted for plants grown at elevated C(sub a), realized in practice? Is photoinhibition accentuated in plants grown in the field at elevated C(sub a) for long-periods. DOE

THE ATMOSPHERIC EFFECTS OF STRATOSPHERIC AIRCRAFT Report No. 2
Richard S. Stolarski, ed. (National Aeronautics and Space Administration. Goddard Space Flight Center, Greenbelt, MD.) and Howard L. Wesoky, ed. Mar. 1993 220 p
(NASA-RP-1293; NAS 1.61:1293) Avail: CASI HC A10/MF A03

This document presents a second report from the Atmospheric Effects of Stratospheric Aircraft (AESA) component of NASA's High-Speed Research Program (HSRP). This document presents a second report from the Atmospheric Effects of Stratospheric Aircraft (AESA) component of NASA's High Speed Research Program (HSRP). Market and technology considerations continue to provide an impetus for high-speed civil transport research. A recent United Nations Environment Program scientific assessment has shown that considerable uncertainty still exists about the possible impact of aircraft on the atmosphere. The AESA was designed to develop the body of scientific knowledge necessary for the evaluation of the impact of stratospheric aircraft on the atmosphere. The first Program report presented the basic objectives and plans for AESA. This second report presents the status of the ongoing research as reported by the principal investigators at the second annual AESA Program meeting in May 1992: Laboratory studies are probing the mechanism responsible for many of the heterogeneous reactions that occur on stratospheric particles. Understanding how the atmosphere redistributes aircraft exhaust is critical to our knowing where the perturbed air will go and for how long it will remain in the stratosphere. The assessment of fleet effects is dependent on the ability to develop scenarios which correctly simulate fleet operations. Author (revised)

THE MAVALE PROJECT: EVALUATION OF POTENTIAL POLLUTION SOURCES TO SUPERFICIAL AND SUBTERRANEAN WATER RESOURCES IN THE PARAIBA DO SUL VALLEY, BRAZIL [PROJECTO MAVALE: AVALIACAO DO POTENCIAL DE POLUICAO DOS RECURSOS HIDRICOS EM FUNCAO DO USO DA TERRA E CARACTERISTICAS DO MEIO FISICO NO VALE DO RIO PARAIBA DO SUL, SP, BRASIL]
Tania Maria Sausen Aug. 1991 14 p In PORTUGESE
(INPE-5318-PRE/1715) Avail: CASI HC A03/MF A01

In May 1976, it was promulgated a law about the prevention and control of environment pollution. In this law, there is a chapter about water pollution. By means of this the objective is to characterize and to evaluate the potential sources (domestic and industrial effluents, waste deposits) in the Paraiba do Sul Valley in order to evaluate the quality of the superficial and subterranean water resources. Multispectral images corresponding to LANDSAT TM 3 and 4, in the scale 1:250.000 patch/row 218 e 219.76 and many thematic maps (land use, geologic, geomorphologic) were analyzed considering the drainage network and the pollution sources in the study area. It was possible to conclude that there are more than 30 pollution sources in the Paraiba do Sul Valley, the water pollution is very high and it is necessary to increase the pollution control in this region.

CHESAPEAKE BAY PROGRAM: WETLANDS WORKGROUP Annual Progress Report
Dec. 1991 13 p
(PB93-136893; CBP/APR-92-105) Avail: CASI HC A03/MF A01

The announcement by President Bush of a national 'no net loss' wetlands policy is the result of growing public concern about the rapid loss of these important resources. Wetlands provide essential breeding, spawning, nesting, and wintering habitats for a major portion of the region's fish and wildlife. In addition, wetlands function to purify surface water, moderate flood flows, maintain year round stream and river flows, reduce erosion, and support commercial fishery and recreation industries. In recognition of the importance of wetlands to the environmental quality and economic productivity of the Bay, the Chesapeake Executive Council adopted the Chesapeake Bay Wetlands Policy in December 1988. The policy includes a commitment to adopt an implementation plan. The annual report discusses the Living Resources Subcommittee's Wetlands Workgroup progress on these projects over the last year, and the near term goals for the next year. The progress to date includes work completed for the first phase and beginning to set up the second phase of the implementation plan.

ATMOSPHERIC CHEMISTRY AND PHYSICAL FATE OF HCFCs AND HFCs AND THEIR DEGRADATION PRODUCTS Interim Report, Sep. 1990 - Sep. 1992
E. O. Edney Dec. 1992 38 p
(PB93-131449; EPA/600/R-92/222) Avail: CASI HC A03/MF A01

Laboratory experiments were conducted to determine the fate of the proposed CFC substitutes HCFC-22, HCFC-123, HCFC-124, HCFC-141b,

HCFC-142b, HFC-125, HFC-134a, and HFC-152a. The program consisted of the following: photochemical oxidation experiments to identify stable oxidation products and measure their yields; deposition studies to measure the extent oxidation products are absorbed into aqueous media; and experiments to determine the fate of hydrolysis products during droplet evaporation. Model results, obtained using laboratory derived lower limit estimates for aqueous deposition velocities and assuming a well mixed atmosphere, suggest the uptakes rates to cloudwater and oceans are sufficiently fast such that significant buildup of gas phase products is unlikely. The laboratory studies suggest that product accumulation in aqueous media could be affected by losses during evaporation. Direct loss by evaporation of halogenated acids and/or production of volatile compounds after further reactions of the dissolved acids could return halogenated compounds to the atmosphere. GRA

ANALYSIS OF ACID PRECIPITATION SAMPLES COLLECTED BY STATE AGENCIES Annual Report, Jan. - Dec. 1990
Lloyd S. Shepard Feb. 1992 254 p Sponsored by EPA, Research Triangle Park, NC
(Contract EPA-68-02-4454)
(PB93-144152; EPA/600/R-93/006) Avail: CASI HC A12/MF A03

The report presents analytical data from the 30 acid precipitation collection sites in the State-Operated Network. Samples are collected weekly in plastic bag liners and shipped in 500 mL polyethylene bottles to Global Geochemistry Corporation (the central laboratory for the network). This report contains maps showing the location of each site, plots of analytical data tables of all field and analytical data, plots comparing field and laboratory pH and conductivity, and information on data quality. Samples are analyzed for pH strong add, conductivity, fluoride, chloride, nitrite phosphate, bromide, nitrate, sulfate, ammonium, sodium, potassium, calcium, and magnesium. The central laboratory renders technical assistance to the collection sites on problems concerning pH and conductivity. Each of the 10 participating state agencies receives analytical reports for the samples analyzed the previous month. Analyte concentration data are put on tape for later inclusion in the Acid Deposition System (ADS) Data Base. GRA

N93-23277# Environmental Protection Agency, Washington, DC. Technology Innovation Office.
INNOVATIVE TREATMENT TECHNOLOGIES Semiannual Status Report No. 4
Linda Fiedler Oct. 1992 87 p
(PB93-133387; EPA/542/R-92/011) Avail: CASI HC A05/MF A01

The twice yearly report contains site-specific information on Superfund sites (both remedial and emergency response actions) and non-Superfund sites (within the Departments of Defense and Energy) where innovative treatment technologies have been or are being used. Innovative treatment technologies are treatment technologies for which a lack of data on cost and performance makes their selection and use at Superfund sites more difficult. The report documents the use of the following innovative treatment technologies to treat ground water in situ, soils, sediments, sludge, and solid-matrix wastes; bioremediation (ex situ), bioremediation (in situ), chemical treatment, dechlorination, in situ flushing, in situ vitrification, soil vapor extraction, soil washing, solvent extraction, thermal desorption, and other technologies. CO2 EXCHANGE, ENVIRONMENTAL PRODUCTIVITY INDICES, AND PRODUCTIVITY OF OPUNTIA FICUS-INDICA UNDER CURRENT AND ELEVATED CO2 CONCENTRATIONS
P. S. Nobel 1992 28 p
(Contract DE-FG03-91ER-61252)
(DE93-006091; DOE/ER-61252/T1) Avail: CASI HC A03/MF A01

This project involved placing mature cladodes (flattened stem segments) of Opuntia ficus-indica in growth chambers containing 360 or 720 ppM CO2. After nine weeks, the new daughter cladodes initiated on the planted cladodes averaged 7 percent higher in biomass but 8 percent less is area, leading to a specific stem mass for this Crassulacean acid metabolism (CAM) species that was 16 percent higher under the elevated CO2 condition. This is less dramatic than the increase in specific leaf mass for C3 and C4 plants under elevated CO2, which generally ranges from 28 to 40 percent. Another contrast with C3 and C4 Plants was the reliance of the new organs of the CAM plant on biomass translocated from existing organs instead of derived directly from current photosynthate. In this regard, 18 percent less dry weight was translocated from basal cladodes into daughter cladodes of Q. ficus-indica at 720 ppM CO2 compared with 360 ppM. DOE

CARBON AND BIOGEOCHEMISTRY
W. M. Post and C. B. Field (Carnegie Institution of Washington, Stanford, CA.) 1992 5 p Presented at the International Satellite and Land Surface Characterization Program Americas, Columbia, MO, 23-24 Jun. 1992
(Contract DE-AC05-84OR-21400)
(DE93-001368; CONF-9206303-1) Avail: CASI HC A01/MF A01

The central issue in global biogeochemistry is understanding the processes that result in flow, storage, and transformation of carbon in the atmosphere, terrestrial vegetation and soil, and oceans. To understand the terrestrial biogeochemistry of carbon it is also necessary to know the dynamics of N in particular, and also P and S. N and S also have important trace gas components in their biogeochemical cycles. In all these activities, remote sensing can play several valuable roles. In order to identify these roles and provide information that can lead to future remote sensing developments that can aid investigations into global biogeochemistry, we need to identify important phenomena, define measures and concepts needed to model and understand them, and clarify the role that remote sensing can play. SURVEY OF DATA FROM THE CONTINUOUS SITES OF THE 1990 ATLANTA OZONE PRECURSOR STUDY
Jack H. Shreffler Nov. 1992 61 p
(PB93-124618; EPA/600/R-92/202) Avail: CASI HC A04/MF A01

The report presents a survey of an air quality data base that was collected in Atlanta, Georgia during July and August 1990. In that period, data were collected continuously at six sites and were recorded as 1-hour averages. Data include concentrations of nitrogen oxides, carbon monoxide, ozone, total non-methane hydrocarbon, and 47 identified species of hydrocarbon. Supporting meteorological data were also recorded. The report contains extensive graphical representations of the data including: (1) mean diurnal curves for all gaseous pollutants; and (2) plots of pollutant characteristics by wind direction. The automated gas chromatography (GC) systems used in the field in Atlanta produced erroneously high isopentane readings at five of the six sites; the problem appeared frequently and in a severe form at two of the sites. COMPUTATIONAL MODELING OF THE ENVIRONMENT WITH APPLICATIONS TO LAKE EUTROPHICATION Ph.D. Thesis
Olli Varis 1991 44 p Sponsored by Suomen Akatemia; Stalaojituksen Tukisaeaetioe r.y.; and Maj and Tor Nessling Foundation
(TKK-1991/1; TKK-Diss-789; ISBN-951-22-0832-6; ETN-93-93691) Avail: CASI HC A03/MF A01

Three shallow Finnish lakes were studied, using computational approaches from three families of techniques. Multivariate techniques were used to investigate the phytoplankton communities and their relation to environmental variables. The analyses were diagnostic, in all but one case, in which the approach was extended to include prediction of the community structure. The lumped parameter approach was used to construct a model for competitive ability of cyanobacteria in one of the lakes. A set of predictive simulations, including changing nutrient input and outflow regulation was performed. Bayesian decision was applied to the analysis of restoration of one of the lakes. The analytic hierarchy process of decision analysis was also reviewed. The substudies showed the need to accept and the ability to utilize a variety of principally different approaches in environmental analysis, and the need to accept different paradigms of scientific problem solving. Equally, the approaches used proved to be applicable in environmental research, planning, and management. ESA

SUSCEPTIBILITY OF EAST COAST ESTUARIES TO NUTRIENT DISCHARGES: PASSAMAQUODDY BAY TO CHESAPEAKE BAY
H. Quinn, J. P. Tolson, C. J. Klein, S. P. Orlando, and C. Alexander Jun. 1989 44 p Sponsored by EPA Prepared in cooperation with Delaware Univ., Newark
(PB93-136927) Avail: CASI HC A03/MF A01

This is the third report in a series being developed to assist the U.S. EPA implement its Near Coastal Waters and National Estuary Programs. It summarizes estimates of the relative susceptibility and status of 17 estuaries on the East Coast from Maine through Virginia, with respect to nutrient-related pollution. The information is intended to increase understanding of coastal environmental problems and to serve as a screening tool for coastal resource decision-making. A one-page summary is included in the report for each of the 17 estuaries in the East Coast region from Passamaquoddy Bay through Chesapeake Bay. Each summary contains data on significant physical and hydrologic features, estimations of nutrient loading, pollution susceptibility, and nutrient concentrations, along with a narrative to assist the reader in interpreting the data. ARCTIC CONTAMINANTS RESEARCH PROGRAM: RESEARCH PLAN
D. H. Landers (Environmental Protection Agency, Corvallis, OR.), J. Ford (Oregon State Univ., Corvallis.), C. P. Gubula (ManTech Environmental Technology, Inc., Corvallis, OR.), S Allen (Oregon State Univ., Corvallis.), L. Curtis (Oregon State Univ., Corvallis.), N. S. Urquhart (Oregon State Univ., Corvallis.), and J. M. Omernik (Environmental Protection Agency, Corvallis, OR.) Dec. 1992 164 p Sponsored by Oregon State Univ., Corvallis, OR Prepared in cooperation with ManTech Environmental Technology International, Inc., Corvallis, OR
(PB93-135630; EPA/600/R-92/210) Avail: CASI HC A08/MF A02

The research plan was initially intended to contain the information needed to evaluate the U.S. Environmental Protection Agency (EPA) Arctic Contaminant Research Program (ACRP). The scientific aspects of the proposed research form the main body of the document and focus on objectives of the specific research components, current literature, approach, and rationale. The ACRP has three major components: (1) extensive sampling of lichens, mosses, and soils to provide a spatial understanding of the status and extent of contaminants present in arctic ecosystems; (2) lake sediment research to evaluate the source and history of arctic contaminant inputs; and (3) food web research to evaluate the possible effects of atmospherically transported pollutants on arctic food webs. The research plan will be used to provide a framework for the ACRP, based on the preliminary studies done to date and will be implemented over the next five years. The program will undergo additional peer reviews at two-year intervals in the future. GRA

REVIEW OF EPA'S ENVIRONMENTAL MONITORING AND ASSESSMENT PROGRAM (EMAP)
Jun. 1992 36 p Sponsored by EPA
(Contract EPA-68-C0-0082/C)
(PB93-146348) Avail: CASI HC A03/MF A01

Review of EPA's Environmental Monitoring and Assessment Program (EMPA) is an interim report on the committee's review of EPA's Environmental Monitoring and Assessment Program (EMAP). The committee endorses EPA's recognition that long-term ecological monitoring and research are essential and that EPA's statutory responsibilities are not limited to human health. The report concluded that probability-based sampling on a grid is an appropriate method of delineating the extent and providing a periodically updated survey of the nation's ecological resources. The committee also addresses questions concerning the ability of EMAP to achieve its other major goals, i.e., the assessment of status, the detection and characterization of changes or trends in the status of the ecological resources of the country, and the establishment of association between ecological condition and human-induced stresses. Because of the many concerns and substantive questions about the design and implementation of EMAP, the committee recommends that the program not be fully implemented until further evaluations are completed. MEASURING VARIATION IN ECOSYSTEM SENSITIVITY TO STRESS Annual Technical Report, Sep. 1991 - Oct. 1992
John Cairns, Jr., Paul V. McCormick, and Eric P. Smith 28 Oct. 1992 35 p
(Grant AF-AFOSR-0379-91)
(AD-A259521; AFOSR-92-1003TR) Avail: CASI HC A03/MF A01

The objectives of this study were to develop a method for measuring biological responses to stress in situ and to use this method to evaluate the extent to which stream ecosystems vary their sensitivity to anthropogenic stress. Chemical-diffusing substrates were constructed from tissue culture flasks and ceramic tiles, which provided a surface that was suitable for the growth of stream microorganisms and porous to most chemicals. Static laboratory tests showed that many common classes of chemicals diffused through these substrates in a highly predictable manner. A laboratory stream study provided further evidence for repeatable diffusion rates and allowed for the standardization of a sampling protocol for characterizing microbial community responses to stress. Two field studies were conducted using the diffusers to evaluate interecosystem variation in stream microbial responses to experimental gradients of sulfuric acid and chlorine. Data analyses from these experiments are ongoing, but indicate that predictable responses to such gradients can be obtained in situ and analyzed using conventional statistical techniques. The protocol developed has broad applications for both basic and applied research in environmental science. GRA

METHODS FOR ANALYZING EXTREME EVENTS UNDER CLIMATE CHANGE Final Report
Richard W. Katz and Barbara G. Brown Jan. 1993 41 p
(Contract EPA-CR-815732-03-0)
(PB93-146827; EPA/600/R-93/014) Avail: CASI HC A03/MF A01

The report summarizes work completed through a cooperative agreement between the National Center for Atmospheric Research (NCAR) and the Environmental Protection Agency (EPA) to study methods for analyzing extreme climate events. The overall goal of this project is to develop statistical models for extreme climate events that will be useful for the construction and application of scenarios of future climate. The results of this study will provide methods for determining how the likelihood of extreme climate events may change as other more general climate parameters (e.g., the mean or variance) change. A SNOW COVER MODEL FOR GLOBAL CLIMATIC SIMULATIONS
Bettina Loth, Hans F. Graf, and Josef M. Oberhuber (Hamburg Univ., Germany.) Jun. 1992 52 p
(MPIM-85; ETN-93-93679) Avail: CASI HC A04/MF A01

A layered one dimensional model of a snow cover, which combines a relatively accurate model physics and a short computer time, is presented. The model simulates the important internal processes of temperature and water vapor diffusion, melting, and freezing, extinction of short wave radiation, and liquid water retention. It is based on the mass and energy balances and can be utilized for both temporal and permanent snow covers. In order to keep the possibility of using the model on a global scale, no local parameterizations are employed. An efficient numerical scheme makes the model suitable for long term climatic studies. Integrations for Potsdam (East Germany), 52 deg north, 13 deg east, with standard synoptic measurements over a period of six winters demonstrate a very good correspondence between the observed and computed values. The remaining problem is the choice of a satisfactory criterion for the distinction between snow and rain which strongly influences the situation results of snow depth and water equivalent. ESA

(Contracts EPA-68-C8-0006; EPA-CR-817426)
(PB93-135622; EPA/600/R-92/241) Avail: CASI HC A05/MF A01

The document describes the first year of research by the Rice Research Program conducted cooperatively at the Environmental Research Laboratory in Corvallis (ERL-C), Oregon, USA; and the International Rice Research Institute (IRRI) at Los Banos, the Philippines. It covers the period of 1 October, 1990 through 30 September, 1991. The first year of the program saw significant accomplishments in setting up the administrative framework for the program, refining the research objectives, and initiating the research. However, this was only the beginning. The next four years of the project will include intensive modeling and research activities to assess the effects of UV-B radiation and global climate change on rice productivity. GRA

CHLOROTRIFLUOROETHYLENE DECAY IN THE ATMOSPHERE: CONTROLLED-ENVIRONMENT CHAMBER STUDIES Interim Report, Oct. 1990 - Nov. 1991
Daniel A. Stone and James R. Long May 1992 70 p
(AD-A259902; AFESC/ESL-TR-91-48) Avail: CASI HC A04/MF A01

A series of experiments conducted to shed additional light on the role of surface-catalyzed reactions on the potential atmospheric oxidation of chlorotrifluoroethylene (CTFE) vapor is discussed. The experiments were conducted in a controlled-environment chamber consisting of a one-meter diameter stainless steel sphere which is Teflon coated. Vapor-phase CTFE was introduced into the chamber at the 5-10 ppm concentration level. It was exposed to helium, then helium with 20 percent oxygen, then helium with 20-50 ppm ozone added, and to humid (approx. 75 percent R.H.) helium, both with and without oxygen. After these initial experiments were concluded, 20 corroded aluminum plates were added to the chamber which increased its surface area by about a factor of ten. Then CTFE was introduced with dry helium, helium plus oxygen, and helium plus ozone. GRA

A MICROCLIMATE MODEL TO INVESTIGATE GREENHOUSE WARMING OF A SUB-ALPINE ECOSYSTEM Ph.D. Thesis
K. P. Shen 1992 85 p
(Contract DE-AC05-76OR-00033)
(DE93-005290; DOE/OR-00033/T507) Avail: CASI HC A05/MF A01

Increasing concentrations of greenhouse gases in the earth's atmosphere are expected to result in a global warming of several degrees Celsius in the coming decades. This warming will have far-reaching impacts on the biosphere, and while General Circulation Models (GCMs) try to predict the magnitude and scope of the warming, there is little information regarding the potential impacts of greenhouse warming on natural systems. An experiment currently under way in a meadow in the Colorado Rocky Mountains attempts to investigate the many consequences of greenhouse warming for soil ecosystems. A mathematical model of the soil microclimate was developed to simulate the soil temperature and moisture content of the meadow. The model simulates both treatment and control scenarios so as to investigate the potential effects of warming. Results of model simulation studies indicate warmer, drier soils under treatment conditions, with the greatest temperature effects of warming occurring at night. These results could have several implications regarding the dynamics of the ecosystem, and future model studies will investigate these connections. DOE

GENERAL CIRCULATION MODEL OUTPUT FOR FOREST CLIMATE CHANGE RESEARCH AND APPLICATIONS
Ellen J. Cooter, Brian K. Eder, Sharon K. LeDuc, and Lawrence Truppi Nov. 1992 63 p
(PB93-124626; EPA/600/R-92/217) Avail: CASI HC A04/MF A01

General Circulation Models (GCM's) have projected global warming of from 3 to 8 degrees F to take place over a period of from 50 to 100 years. The Forest Service Southern Global Change Program (SGCP) has proposed the use of GCM output as input to forest assessment models to estimate the potential impacts of climate changes on forests of the South and Southeastern U.S. The report reviews, organizes, summarizes and makes recommendations concerning the use of four climate model projections in forest assessments. Some primary sources of inter-model variability include model version (age), numerical solution technique, time and space resolution, and parameterization schemes. Model version generally impacts the time and space resolution and choice of parameterization schemes. Magnitude of change varies widely, but the four GCM's examined here all project warmer air temperatures and higher humidities throughout the year, decreasing cloud cover during the Fall, Winter, and Spring seasons and increasing summertime precipitation for the South and Southeastern U.S. Although some consensus among models over large geographic regions can be identified, there is as yet, no established means of determining the confidence that can be placed in these outlooks. GCM output should be combined with historical case studies and empirical and semi-empirically constructed climate scenarios to provide a range of possible climatological futures. Author

THE 111TH MEETING FOR RESEARCH OF SAFETY ENGINEERING
27 Jul. 1992 8 p In JAPANESE Meeting held 27 Jul. 1992
(DE93-753679; ETDE/JP-mf-93753679) Avail: CASI HC A02/MF A01

The 111th meeting for research of safety engineering was held on 27th July, 1992. The topic presented by Igawa of Kanagawa university has been movement and effect of acid materials in the environmental atmosphere. Further, Hyomi of Japan environmental health center has made presentation on the present condition of environmental pollution in Japan and East Asian countries, mainly emphasizing atmospheric pollution. According to former presentation, the main acid materials contained in the pollutants released in the atmosphere are sulfur oxides and nitrogen oxides. The fallout of acid materials are represented by acid rain and acid fog,

and they have environmental effects such as: direct effect to human body, destruction of forest, acidification of lakes and marshes, and pollution of outdoor sculptures and construction materials. It is cited that the termination of the source for pollution is necessary to solve the pollution problems. As for the later topic, the presentation is made on the results of direct investigation of atmospheric pollution problems faced by Taiwan, Thailand and China since 1980's. DOE

THE CLIMATE INDUCED VARIATION OF THE CONTINENTAL BIOSPHERE: A MODEL SIMULATION OF THE LAST GLACIAL MAXIMUM
P. Friedlingstein (Vrije Univ., Brussels, Belgium.), C. Delire (Liege Univ., Belgium.), J. F. Mueller, and J. C. Gerard (Liege Univ., Belgium.) 1992 20 p Submitted for publication
(Aeronautica-Acta-A-366; ETN-93-93538) Avail: Inst. d'Aeronomie Spatiale de Belgique, 3 Avenue Circulaire, B-1180 Brussels, Belgium

A simplified three dimensional global climate model was used to simulate the surface temperature and precipitation distributions for the Last Glacial Maximum (LGM), 18,000 years ago. These fields were applied to a bioclimatic scheme which parameterizes the distribution of eight vegetation types as a function of biotemperature and annual precipitation. The model predicts a decrease, for LGM compared to present, in forested area balanced by an increase in desert and tundra extent, in agreement with a reconstruction of the distribution of vegetation based on paleodata. However, the estimated biospheric carbon content (phytomass and soil carbon) at LGM is less reduced than in the reconstructed one. Possible reasons for this discrepancy are discussed. ESA

GUIDELINES FOR ESTIMATING AND APPLYING RULE EFFECTIVENESS FOR OZONE CO STATE IMPLEMENTATION PLAN BASE YEAR INVENTORIES
Nov. 1992 84 p Sponsored by Environmental Protection Agency, Research Triangle Park, NC
(Contract EPA-68D00121)
(PB93-131498; EPA/452/R-92/010) Avail: CASI HC A05/MF A01

The guidelines describe the procedures developed by the Office of Air quality Planning and Standards (OAQPS) to estimate the effectiveness of existing regulatory programs to achieve emissions control for stationary sources. One approach is the detailed study protocol developed by the Environmental Protection Agency (EPA) Stationary Source Compliance Division (SSCD) involving on-site inspection and testing on a single source category by source category basis. The second approach, developed by the Air Quality Management Division (AQMD), involves answering generic questionnaires using available file information for specific sources and extrapolating the results to other sources in the same source categories. The third option is to use the 80 percent default for estimating RE. The results of these approaches are to be used to estimate RE for the base year emission inventories being prepared in response to the 1990 CAAA calls for ozone and CO SIP's. GRA

HYDRAZINE DECAY IN THE ATMOSPHERE: CONTROLLED-ENVIRONMENT CHAMBER STUDIES AND KINETIC MODELING Final Report, Oct. 1987 - Sep. 1990
Daniel A. Stone and James R. Long Feb. 1992 229 p
(AD-A260252; AFCESA/ESL-TR-91-34) Avail: CASI HC A11/MF A03

A series of experiments conducted to shed additional light on the role of surface-catalyzed reactions on the atmospheric oxidation of hydrazine vapor are documented. The experiments were conducted in a controlled-environment chamber consisting of a one-meter diameter stainless steel sphere which is Teflon coated. Vapor-phase hydrazine was introduced into the chamber at the 50-100 ppm concentration level. It was combined with four different synthetic atmospheric mixtures (all at one atmosphere total pressure): dry helium, humid (approx. 75 percent R.H.) helium, 80 percent dry helium plus 20 percent oxygen, and 80 percent humid helium plus 20 percent oxygen. A series of experiments were conducted, using the same four synthetic atmospheres listed above, with several types of plates which were placed into a rack in the chamber. These plates included: Teflon-coated aluminum (TCA), black iron (BI), corroded aluminum (CA), and F-16 painted aluminum (PA). The reactivity of the plates towards hydrazine decay was: TAC is less than BI approximatley equal to PA is less than CA. GRA

NOAA/CMDL ATMOSPHERIC METHANE DATA FROM SHIPBOARD FLASK SAMPLING Technical Report, 1983 - 1990
P. M. Lang, L. P. Steele, L. S. Waterman, R. C. Martin, and K. A. Masarie Nov. 1992 94 p Sponsored by Cooperative Inst. for Research in Environmental Science, Boulder, CO
(PB93-136489; NOAA-TM-ERL-CMDL-4) Avail: CASI HC A05/MF A01

The memorandum presents atmospheric methane data obtained through the shipboard sampling component of the NOAA/CMDL global cooperative flask sampling program. A significant part of the program has involved flask sampling from a commercial container ship, the Southland Star, on regular crossings of the Pacific Ocean between the U.S. west coast and New Zealand. Shipboard flask sampling has also been carried out on a variety of oceanographic research expeditions. Tabulations are provided for individual flask measurements and annual mean methane mixing ratios for 14 sites spaced every five degrees of latitude across the Pacific Ocean between 30 deg N and 35 deg S. The methane data from the Southland Star are also shown as time series plots. The locations of flask sampling on the oceanographic research expeditions are shown in a series of maps. The flask methane data from these expeditions are shown as a series of plots of methane versus latitude. A brief history of the development of the sampling program is included. Flask sampling methods, and analytical and calibration procedures are documented. GRA

DIRECT CATALYTIC DECOMPOSITION OF NITRIC OXIDE
M. Flytzani-Stephanopoulos, A. F. Sarofim, and Y. Zhang 1992 13 p
(Contract DE-FG22-91PC-91293)
(DE93-008107; DOE/PC-91293/T1) Avail: CASI HC A03/MF A01

This project investigates a suitable catalyst system for direct NO decomposition in post-combustion NO(x) control. Since the process does not use a reductant, it is a greatly simplified process basically involving passing the flue gas through a catalytic converter. Catalysts are prepared by incorporating metal cations into zeolite supports by ion exchange. Catalysts of primary interest include Cu, Pd, Ag, and Ni exchanged zeolites. Particular emphasis is given on promoted Cu-exchanged zeolites, especially the catalyst system Mg/Cu-ZSM-5 and a few others, which are promising for NO conversion to nitrogen at typical flue gas O2 and NO levels and over the temperature range of 723-873 K. Effects of zeolite modification, Cu exchange level and catalyst preparation conditions on the catalyst activity are studied in a packed-bed microreactor. Temperature-programmed desorption and reduction experiments will be carried out in a thermogravimetric analyzer and a single-particle electrodynamic balance. Kinetic studies of NO and O2 interaction with catalysts over a wide temperature range as well as catalyst structural investigations are planned. DOE

AEROSOL MEASUREMENTS AT THE SOUTH POLE DURING 1987
Barry A. Bodhaine and Joyce M. Harris Nov. 1992 122 p
(PB93-137016; NOAA-DR-ERL-CMDL-9) Avail: CASI HC A06/MF A02

The Climate Monitoring and Diagnostics Laboratory (CMDL) of the National Oceanic and Atmospheric Administration (NOAA) operates an atmospheric monitoring observatory at Amundsen-Scott Station, South Pole. The aerosol measurement program consists of the continuous measurement of condensation nuclei (CN) concentration and aerosol scattering extinction coefficient. During 1987, a special aerosol experiment was conducted that included filter samples for subsequent analysis by the proton induced x-ray emission technique, diffusion battery measurements for size information in the sub-0.1 micrometer size range, and aerosol absorption measurements using an aethalometer. Surface and upper air meteorological data were also available. The purpose of the report is to present all of the aerosol data obtained during 1987. GRA

USE OF HIGH-ENERGY RADIATION FOR DEGRADATION OF ENVIRONMENTAL POLLUTANTS
R. D. Guthrie and M. Patwardhan Oct. 1992 54 p Sponsored by Geological Survey, Reston, VA, and NIH
(Contract DI-14-08-0001-G2021; NIH-BRSG-S07-RR07114-21)
(PB93-149995; RR-183; USGS/G-2021-04) Avail: CASI HC A04/MF A01

The purpose of the project was to explore the advantages and/or limitations of high-energy radiation treatment as a method for degrading organic pollutants, particularly aryl halides, in an aqueous medium. The authors have done analyses of (60) Co-irradiated samples and kinetic studies using pulsed electron beams. For aryl halides containing no more than two fused rings, the main products detected are those of simple halogen replacement by hydrogen, although the amount of aryl halide destroyed was always greater than the total amount of products detected. To accomplish halogen replacement by H, the reaction solvent may not be pure water but must contain a hydrogen source such as an aliphatic alcohol. The absence of such an additive, results in products of aryl radical addition to aryl halide. The necessary amount of additive required is quite small for halobenzenes. With aryl halides of three (and presumably more than three) fused rings, the radical-anion intermediates either undergo conversion to halogen-containing dihydroarenes, or lose halogen to form radicals which resist reaction with H-donating additive and thus form timers. When aryl halides are solubilized in micelle-forming detergent solutions, the detergent molecules serve as hydrogen atom sources. Conversions are highest with cat ionic detergents. GRA

The Documentation Manual contains descriptive information about each data-set and exact file descriptions for each element in the data-set. The data-set descriptions are structured according to a precise template that is described in detail (Documentation Template Definitions). The Data-Set Description provides an in-depth identification and tracking of the data-set and its technical properties, and gives key references for the data-set. At the end of this description is a summary of any Data Integration and Quality work associated with the project. Such work may range from simple format conversion to complicated re-structuring, interpolation, and testing. A user's guide is provided as a separate document. In addition to their printed versions, the User's Guide and Documentation Manuals are provided in computer-readable form (bit-mapped image format) on the CD-ROM's. Reprints of the Primary References, including published journal articles, if applicable, are provided separately from the Documentation Manual as scanned image files on the CD-ROM. Reprints are assembled from available reports and publications, with permission from the authors and publishers. Only materials that are directly relevant to documenting the data-sets are reproduced. REPORT OF THE WORKING GROUP ON MAGNETOTAIL/PLASMA SHEET STRUCTURE
J. Birn and D. Fairfield (National Aeronautics and Space Administration. Goddard Space Flight Center, Greenbelt, MD.) 1992 11 p Presented at the Geospace Environment Modeling Workshop on Magnetotail/Substorms, Snowmass, CO, 2-3 Jul. 1992
(Contract W-7405-eng-36)
(DE93-003857; LA-UR-92-3845; CONF-9207168-1) Avail: CASI HC A03/MF A01

The magnetotail and its imbedded plasma sheet represent the major region where excess energy is stored in the magnetosphere. It is consequently the principal site where energy release starts and magnetospheric activity is initiated. The qualitative understanding and quantitative description of its average and instantaneous structure and its dependence on solar wind and ionospheric boundary conditions are therefore at the core of magnetospheric physics and modeling. The assessment of present knowledge and open questions concerning the average tail and its instantaneous structure during steady periods or for changes that are slow in comparison to the fast dynamic scale of magnetospheric substorms are addressed. Quantitatively, one might draw a distinction at about 1 minute, which is slightly larger than a typical magnetosonic (or Alfven) wave propagation time over a characteristic macroscopic scale of a few Earth radii. This restriction not only excludes the fast dynamic evolution after substorm (expansive phase) onset but also time-dependent phenomena such as waves, eigenmodes, etc. that are not necessarily related to substorm activity. Questions of stability are excluded. The major goal within this area consists of the construction and improvement of quantitative models, empirical and selfconsistent, at various levels of sophistication as required by particular applications. Such models not only represent the quantification of observations and physical understanding of the magnetospheric structure but also are needed as the basis for a variety of further investigations, such as test particle studies, stability analyses, and MHD simulations.

USER'S GUIDE TO THE PENN STATE/NCAR MESOSCALE MODELING SYSTEM Technical Note
David O. Gill Oct. 1992 230 p Sponsored by National Science Foundation, Washington, DC
(PB93-126654; NCAR/TN-381+IA) Avail: CASI HC A11/MF A03

An updated version of the Pennsylvania State University/National Center for Atmospheric Research (PSU/NCAR) Mesoscale Modeling system (the MM4 system) is presented. The standard MM4 modeling package employs a Cressman multi-scan isobaric and surface analysis, with a hydrostatic predictive component using a leap frog integration of the flux form of the primitive equations on sigma coordinates. An experimental version has expanded the data ingest routines to allow hybrid isentropic-isobaric + surface analyses. Experimental versions of the model allow split-explicit time integration, several cumulus parameterizations coupled with an explicit moisture scheme, multiple levels of movable nests, relaxation of the hydrostatic assumptions, additional planetary boundary layer schemes, and microphysical packages. Due to the developmental nature of the modeling system, periodic upgrades in documentation are required to keep the manuals in accord with the programs. The document supersedes Penn State/NCAR Mesoscale Model User's Manual--Ver 8.

A COMPARISON OF DECONVOLUTION TECHNIQUES
C. J. Ammon Aug. 1992 43 p
(Contract W-7405-eng-48)
(DE93-007407; UCRL-ID-111667) Avail: CASI HC A03/MF A01

In the following, I compare several approaches to the deconvolution of a wavelet from a seismogram, when the wavelet can be estimated beforehand. Specifically, I examine the frequency domain waterlevel method, a least-squares, frequency-dependent weighting scheme, and a time-domain approach using the Singular Value Decomposition. I illustrate each deconvolution technique by estimating receiver functions using both high quality and low quality seismic waveforms. Each technique performs well with high quality data, and all have problems with noisy data. In cases where the data do not allow a complete extraction of desired information, the time domain approach is the more useful method to interpret the resulting waveforms. Singular Value Decomposition also permits an optimal combination of information from several deconvolutions or a quantitative comparison of the results from several deconvolutions. Additionally, the time domain approach is readily adaptable to multi-waveform deconvolution.

INNER MAGNETOSPHERE IMAGER (IMI) INSTRUMENT HERITAGE
G. R. Wilson Mar. 1993 31 p
(Grant NGT-01-002-099)
(NASA-CR-4498; M-714; NAS 1.26:4498) Avail: CASI HC A03/MF A01

This report documents the heritage of instrument concepts under consideration for the Inner Magnetosphere Imager (IMI) mission. The proposed IMI will obtain the first simultaneous images of the component regions of the inner magnetosphere and will enable scientists to relate

these global images to internal and external influences as well as local observations. To obtain simultaneous images of component regions of the inner magnetosphere, measurements will be made of: (1) the ring current and inner plasma sheet using energetic neutral atoms; (2) the plasmasphere using extreme ultraviolet; (3) the electron and proton auroras using far ultraviolet and x rays; and (4) the geocorona using FUV. Instrument concepts that show heritage and traceability to those that will be required to meet the IMI measurement objectives are described. Author (revised)

EFFECTS OF UGTs ON THE IONOSPHERE
P. E. Argo and T. J. Fitzgerald 1992 18 p Presented at the RAS/VERTIC Symposium on Verification of Nuclear Testing Treaties, London, England, 14 Feb. 1992
(Contract W-7405-eng-36)
(DE93-000793; LA-UR-92-2909; CONF-9202138-1) Avail: CASI HC A03/MF A01

The processes that propagate local effects of underground nuclear tests from the ground into the upper atmosphere, and produce a detectable signal in the ionosphere are described. Initially, the blast wave from a underground test (UGT) radially expands, until it reaches the surface of the earth. The wave is both reflected and transmitted at this sharp discontinuity in propagation media. The reflected wave combines with the incident wave to form an 'Airy surface,' at which very strong ripping forces tear the earth apart. This broken region is called the 'spat zone,' and is launched into ballistic motion. The resultant ground motion launches an acoustical wave into the atmosphere. This acoustic wave, with overpressures of a few tenths of one percent, propagates upwards at the speed of sound. Assuming purely linear propagation, the path of the acoustic energy can be tracked using raytracing models. Most of the wave energy, which is radiated nearly vertically, tends to propagate into the upper atmosphere, while wave energy radiated at angles greater than about 30 degrees to the vertical will be reflected back to earth and is probably what is seen by most infrasonde measurements. THE 3-D NUMERICAL INVESTIGATION OF THE MANTLE DYNAMICS ASSOCIATED WITH THE BREAKUP OF PANGEA
J. R. Baumgardner 1992 19 p Presented at the NATO Advanced Study Institute on Dynamics Modeling and Flow in the Earth and Planets, Fairbanks, AK, Jun. 1991
(Contract W-7405-eng-36)
(DE93-000796; LA-UR-92-2943; CONF-9106401-1) Avail: CASI HC A03/MF A01

Three-dimensional finite element calculations in spherical geometry are performed to study the response of the mantle with platelike blocks at its surface to an initial condition corresponding to subduction along the margins of Pangea. The mantle is treated as an infinite Prandtl number Boussinesq fluid inside a spherical shell with isothermal, undeformable, free-slip boundaries. Nonsubducting rigid blocks to model continental lithosphere are included in the topmost layer of the computational mesh. At the beginning of the numerical experiments these blocks represent the present continents mapped to their approximate Pangean positions. Asymmetrical downwelling at the margins of these nonsubducting blocks results in a pattern of stresses that acts to pull the supercontinent apart. The calculations suggest that the breakup of Pangea and the subsequent global pattern of seafloor spreading was driven largely by the subduction at the Pangean margins. DOE

TEXT AND REFERENCES TO ACCOMPANY 'MAP SHOWING THE THICKNESS AND CHARACTER OF QUATERNARY SEDIMENTS IN THE GLACIATED UNITED STATES EAST OF THE ROCKY MOUNTAINS'
David R. Soller 1992 64 p
(PB93-129864; USGS-BULL-1921; LC-90-3388) Avail: CASI HC A04/MF A01

A 1:1,000,000-scale map of quaternary deposits has been compiled for the glaciated area of the United States east of the Rocky Mountains. Parts of southern Ontario, areas beneath the Great Lakes, and parts of the submerged eastern seaboard are also included on the map. The map has three components that, together, provide the first regional three-dimensional view of these deposits. These map components are the surface distribution of quaternary sediments, the total thickness of quaternary sediments, and the distribution of significant buried quaternary units. For many areas, this is the first map of the quaternary sediment thickness published at any scale. The report provides supporting information for the map, preliminary interpretations or sediment distribution, and the list of geologic sources used to generate the map. Author

NONLINEAR DYNAMICAL MODELING AND PREDICTION OF THE TERRESTRIAL MAGNETOSPHERIC ACTIVITY Ph.D. Thesis
Dimitris Vassiliadis 1992 170 p
Avail: Univ. Microfilms Order No. DA9234675

The irregular activity of the magnetosphere results from its complex internal dynamics as well as the external influence of the solar wind. the dominating self-organization of the magnetospheric plasma gives rise to repetitive, large-scale coherent behavior manifested in phenomena such as the magnetic substorm. Based on the nonlinearity of the global dynamics this dissertation examines the magnetosphere as a nonlinear dynamical system using time series analysis techniques. Initially the magnetospheric activity is modeled in terms of an autonomous system. A dimension study shows that its observed time series is self-similar, but the correlation dimension is high. The implication of a large number of degrees of freedom is confirmed by other state space techniques such as Poincare sections and search for unstable periodic orbits. At the same time a stability study of the time series in terms of Lyapunov exponents suggests that the series is not chaotic. The absence of deterministic chaos is supported by the low predictive capability of the autonomous model. Rather than chaos, it is an external input which is largely responsible for the irregularity of the magnetospheric activity. In fact, the external driving is so strong that the above state space techniques give results for magnetospheric and solar wind time series that are at least qualitatively similar. Therefore the solar wind input has to be included in a low-dimensional nonautonomous model. Indeed it is shown that such a model can reproduce the observed magnetospheric behavior up to 80-90 percent. The characteristic coefficients of the model show little variation depending on the external disturbance. The impulse response is consistent with earlier results of linear prediction filters. The model can be easily extended to contain nonlinear features of the magnetospheric activity and in particular the loading-unloading behavior

of substorms. The above results encourage the use of low-dimensional driven models for the solar wind-magnetosphere coupling. Dissert. Abstr.

USE OF GEODETIC METHODS IN DETECTING TERRAIN MOVEMENTS WITH SPECIAL REFERENCE TO THE GLOBAL POSITIONING SYSTEM Ph.D. Thesis
Mohamed Fathy Hassan El-Maghraby 1991 251 p
(ISBN-0-315-69179-4) Avail: Univ. Microfilms Order No. DANN69179

Subsurface movements are monitored using geotechnical instruments. The geodetic-terrestrial methods are suitable for detecting surface deformations; but they are limited by the requirements of stations' inter-visibility and favorable weather conditions. The Global Positioning System (GPS) is not so restricted. There are several types of GPS receivers. The associated software estimates the baseline components and provides a number of quality parameters. However, the literature on the application of GPS to terrain movement studies does not provide guidance regarding the appropriate length of an observing session and it lacks a procedure to evaluate the anticipated error of each estimate. These issues are investigated experimentally for lines up to 500 m and observing sessions up to 60 minutes. The data were collected in 1989 under favorable and unfavorable conditions with Trimble receivers and processed using the Trimvec software in full sessions as well as 15-minute sub-sessions. The analysis shows that the estimates derived from bias-fixed-at-integer solutions are the only reliable estimates. Ninety six percent of all such estimates of L1 carrier frequency data from 15-minute observations have baseline length errors less than 5 cm and height difference errors less than 10 cm. The corresponding numbers for estimates from full sessions are 2 cm and 5 cm. Further analysis of the data shows that the individual quality parameters are not reliable identifiers of accuracy. Combined in linear discriminant functions these parameters are shown to provide a powerful means of classifying individual estimates. The effectiveness of this approach is demonstrated by verifying the discriminant-function classification of baseline length and height difference from 15-minute observations at the 2 cm and 5 cm accuracy level, respectively; and the height difference for 40 to 60-minute session at the 2 cm level. It is concluded that terrain movements of 20-50 mm over a distance of up to 500 m can be detected if the terminals of the baseline are occupied repeatedly for 40 to 60-minutes. Movements greater than 50 mm can be detected by repeated 15-minute observations. Smaller movements are more reliably monitored with geodetic-terrestrial methods. Dissert. Abstr.

THE EFFECT OF CURRENT-INDUCED STRESS PERTURBATION ON LARGE- AND MESO-SCALE AIR-SEA INTERACTIONS Ph.D. Thesis
Lian Xie 1992 175 p
Avail: Univ. Microfilms Order No. DA9239673

The effect of the stress modulation by the surface currents is studied using a quadratic stress law, for various physical processes in the atmosphere-ocean system. In the presence of surface currents, a stress perturbation is induced by the current structure because of a modulation of the velocity shear at the air-sea interface. In the case of a unidirectional current and a uniform wind, it is proportional to and opposing the surface current vorticity. This causes a spindown effect on the surface vorticity field at a rate proportional to the wind speed. In the steady state, or in slowly varying processes which can be treated as parametrically developing quasi-steady states, the surface layer potential vorticity modulation causes up- and down-welling patterns associated with the surface-current vorticity. These effects are analyzed, first in a 2.5-layer quasi-geostrophic (QG) f-plane system and then in a two-layer as well as in a continuously stratified QG beta-plane system. The f-plane solution shows that the damping effect is effectively limited to the surface layer. The beta-plane solution shows that the perturbation stress induced by the surface current is an important damping mechanism for the baroclinic Rossby waves. The responses of the tropical atmosphere-ocean system to the current-induced stress perturbation are explored in a simple coupled model. We find that in the absence of mean currents the current-induced stress perturbation imposes a damping effect on both sides of the air-sea interface. In the presence of a mean current, the stress perturbation created by the mean current imposes a damping effect on the mean current itself, but can enhance the perturbation flow field through momentum exchanges between the two mediated by the interface stress. The coupling strength of the atmosphere-ocean system is thus modulated by the stress perturbation. Finally, the reactionary effect of the current induced stress perturbation on the atmospheric boundary-layer flow is briefly discussed. Computations for simple current patterns and constant large-scale winds show that substantial updraft at the top of the trade wind boundary layer can be produced by the ageostrophic transport divergence induced mechanically by an intense oceanic jet.

A PROPOSED NEUTRAL LINE SIGNATURE
I. Doxas, T. W. Speiser, P. B. Dusenbery, and W. Horton (Texas Univ., Austin.) [1992] 22 p
(Grant NAGw-2968)
(NASA-CR-192335; NAS 1.26:192335) Avail: CASI HC A03/MF A01

An identifying signature is proposed for the existence and location of the neutral line in the magnetotail. The signature, abrupt density, and temperature changes in the Earthtail direction, was first discovered in test particle simulations. Such temperature variations have been observed in ISEE data (Huang et. al. 1992), but their connection to the possible existence of a neutral line in the tail has not yet been established. The proposed signature develops earlier than the ion velocity space ridge of Martin and Speiser (1988), but can only be seen by spacecraft in the vicinity of the neutral line, while the latter can locate a neutral line remotely. PHYSICAL AND DIRECT METHODS IN CRYSTALLOGRAPHY Ph.D. Thesis
Adam Charles Ralph 1991 135 p
Avail: Univ. Microfilms Order No. BRDX97542

This work consists of two main parts, with the one intention of extending the size of structures that can be solved by direct methods. The first part adapts a physical method which uses anomalous scattering data. The anomalous differences in conjunction with the positions of the anomalous scatterers create two possible values for each phase. This ambiguity makes the process of phase refinement easier. Two methods, the MPS method and the Wilson distribution method, are used to break the phase ambiguity. They are tested on two structures, avian pancreatic polypeptide (APP) which crystallizes in C2 and has 36 amino acid residues per asymmetric unit and ribonuclease Sa (RNA) which crystallizes in P2(1)2(1)2(1) and has 192 amino acid residues per asymmetric unit. Both methods are successful in solving APP but both are unsuccessful with RNA. Thus, this indicates a limit to the size of the structure that can be solved using these methods. The second part consists of refining phases by analyzing the determinant of a Karle-Hauptman matrix. This method is tested on a small structure, MUNICH, which crystallizes in C2 and has 160 carbon atoms in the unit cell. For each value of the determinant there are an infinite number of matrices related by similarity transforms. Therefore, the matrix is reformed so that three phase invariants are refined. It is found that the matrix determinant must be refined to zero, using a suitable matrix, in order for the phases to be refined successfully. More research needs to be carried out before any hard judgements can be made as to the suitability of using Karle-Hauptman matrices on larger structures. Dissert. Abstr.

(PB93-132769; GRI-92/0459) Avail: CASI HC A07/MF A02

The Upper Pennsylvania (lower Missourian) Cleveland formation produces gas from low-permeability ('tight') sandstone reservoirs in the western Anadarko Basin of the northeastern Texas Panhandle. In the six-county region, these reservoirs had produced more than 412 Bcf of natural gas through December 31, 1989. Because of their typically low permeability, the Cleveland sandstones require acidizing and hydraulic fracture treatment to produce gas at economic rates. Since 1982, the Gas Research Institute has supported geological investigations throughout the United States to develop the scientific and technological knowledge for producing from low-permeability, gas-bearing sandstones. As part of the program and the GRI Tight Gas Sands project, the Bureau of Economic Geology has been conducting research on low-permeability sandstones in the Cleveland formation and on several other sandstone units of similar character in Texas and Wyoming. MASSIVELY PARALLEL IMPLEMENTATION OF THE PENN STATE/NCAR MESOSCALE MODEL
I. Foster and J. Michalakes 1992 5 p Presented at the 73rd American Meteorological Society Annual Meeting, Anaheim, CA, 17-22 Jan. 1993
(Contract W-31-109-eng-38)
(DE93-004874; ANL/CP-77502; CONF-930133-6) Avail: CASI HC A01/MF A01

Parallel computing promises significant improvements in both the raw speed and cost performance of mesoscale atmospheric models. On distributed-memory massively parallel computers available today, the performance of a mesoscale model will exceed that of conventional supercomputers; on the teraflops machines expected within the next five years, performance will increase by several orders of magnitude. As a result, scientists will be able to consider larger problems, more complex model processes, and finer resolutions. In this paper. we report on a project at Argonne National Laboratory that will allow scientists to take advantage of parallel computing technology. This Massively Parallel Mesoscale Model (MPMM) will be functionally equivalent to the Penn State/NCAR Mesoscale Model (MM). In a prototype study, we produced a parallel version of MM4 using a static (compile-time) coarse-grained 'patch' decomposition. This code achieves one-third the performance of a one-processor CRAY Y-MP on twelve Intel 1860 microprocessors. The current version of MPMM is based on all MM5 and uses a more fine-grained approach, decomposing the grid as finely as the mesh itself allows so that each horizontal grid cell is a parallel process. This will allow the code to utilize many hundreds of processors. A high-level language for expressing parallel programs is used to implement communication streams between the processes in a way that permits dynamic remapping to the physical processors of a particular parallel computer. This facilitates load balancing, grid nesting, and coupling with graphical systems and other models. DOE

IMPACT OF A NEWTONIAN ASSIMILATION AND PHYSICAL INITIALIZATION ON THE INITIALIZATION AND PREDICTION IN A TROPICAL MESOSCALE MODEL Ph.D. Thesis
Kok-Seng Yap 1992 254 p
Avail: Univ. Microfilms Order No. DA9234261

One of the major limitations of tropical hydrostatic mesoscale models initialized through synoptic and subsynoptic scale data and operating on a grid resolution of 20-50km is that they show limited skill in simulating the spatial and temporal distribution of precipitation despite well-predicted synoptic and subsynoptic-scale flow patterns. In general the models show a precipitation spin-up phase, however once activated, the model tends to become convectively overactive through the synoptic scale-mesoscale feedback mechanism. Our experience suggests that for the tropics where the mesoscale circulations are convectively active, the precipitation spin-up arises from the inability of the initial synoptic-scale analysis to produce dynamic, thermodynamic and moisture fields capable of supporting convection of the mesoscale. In particular, the problem lies in the wrong initial analysis of the velocity divergence and moisture fields. The overactive convection in the model arises when the model fails to initiate convection over some of the areas that are observed to precipitate, hence feeding the available moisture into the model activated regions. It is shown in this study that this spin-up and overactive convection problem can be overcome by carrying out a dynamic Newtonian assimilation coupled with physical initialization during a preforecast integration phase of the model. In particular it is shown that the Newtonian assimilation of the rotational component of the wind and surface pressure coupled with physical initialization of surface fluxes of moisture, cumulus parameterization and outgoing longwave radiation (OLR) enables the model to build the divergence and moisture fields at the required location. The cumulus initialization is done through a humidity reanalysis via a 'Reverse Kuo' algorithm. The surface latent heat flux initialization is done by reanalysis of the model's lowest level humidity fields through a 'Reverse similarity algorithm', and the OLR initialization is done through a humidity reanalysis at the upper levels by matching the model OLR with satellite observations. Dissert. Abstr.

LONG PERIOD PULSATION EVENTS IN ELECTRON PRECIPITATION AND MAGNETIC FIELDS AT THE SOUTH POLE Ph.D. Thesis
John Anthony Paquette 1992 161 p
Avail: Univ. Microfilms Order No. DA9234636

Geomagnetic pulsation events with long (100-1000 second) periods that are accompanied by electron precipitation pulsations at the same frequency were reported at various latitudes. A search of the data from South Pole station for the period from 1982 to 1989 revealed over 200 such events. A comparison of these events with the predictions of Coroniti and Kennel (1970) was undertaken, including examination of VLF data, interplanetary magnetic field data, DMSP satellite data, and data from South Pole's conjugate station at Iqaluit, as well as the riometer and magnetometer data from South Pole used in the original search. Data from the IRIS Imaging Radiometer were also used when available. A consideration of the respective wave and particle transit times from the magnetic equator to the ground leads to an expectation that the onset of pulsations in the magnetometer data will lag the onset of pulsations in the riometer data by several minutes. This disparity in onset times, together with VLF modulation in the proper frequency range, serve as important indicators of whether or not an event can be explained by the above-cited theory. While about a third of the events fit the prediction of Coroniti and Kennel, another third cannot be explained by this theory, and possible alternative mechanisms are explored. The remaining third of the events appear at first to be inexplicable in terms of any transit time argument, but analysis of the IRIS data shows that this third class of events arises from differences in the spatial coverage of the instruments. Dissert. Abstr.

TRANSVERSE ION ACCELERATION BY LOCALIZED LOWER HYBRID WAVES IN THE TOPSIDE AURORAL IONOSPHERE Ph.D. Thesis
Jorge Luis Vago 1992 147 p
Avail: Univ. Microfilms Order No. DA9236075

Up to now, observations had been unable to show conclusively a one-to-one correspondence between perpendicular ion acceleration and a particular type of plasma wave within the O(+) source region below 2000 km. In this thesis, we demonstrate that intense (100-300 mV/m) lower hybrid waves are responsible for transversely accelerating H(+) and O(+) ions to characteristic energies of up to 6 eV. This wave-particle interaction takes place in thin filamentary density cavities oriented along geomagnetic field lines. The measurements we discuss were conducted in the nightside auroral zone at altitudes between 500 km and 1100 km. Our results are consistent with theories of lower hybrid wave condensation and collapse. Dissert. Abstr.

METALLIC IONS AND ATOMS IN THE UPPER ATMOSPHERE Annual Report, 1 Jan. - 31 Dec. 1992
Jeffrey M. Forbes and R. G. Roble 15 Oct. 1992 14 p

(Contract F49620-92-J-0092)
(AD-A259741; AFOSR-92-1009TR) Avail: CASI HC A03/MF A01

The main focus of research under AFOSR Grant F49620-92-J-0092 is to investigate the global and local transport of metallic ions in the upper atmosphere, in particular the layering of ionization, through use of comprehensive numerical models which account for realistic meteoric sources, chemical conversions and sinks, and transport by molecular and eddy diffusion, winds, and electric fields. The ultimate goal is to better understand the mechanisms producing ionization layers, and ultimately the seasonal, latitudinal, local time, and temporal variations in the occurrences of ionization layers. Plasma layering can affect HF communications by introducing new reflection paths thus complicating the propagating modes, and presumably in extreme cases by producing blanketing effects. In addition, plasma irregularities may also accompany the sharp gradients characterizing the plasma layers. GRA

Measurements of light absorption and light scattering coefficients of carbon particles in air suspension, with approximate diameters ranging from 0.59 microns to 0.66 microns, have been made by photoacoustic spectroscopy and nephelometry, respectively. The mean absorption coefficient of these aerosols found by photoacoustic spectroscopy was 3.8 x 10(exp -5) m(exp -1) as compared to a mean of 1.2 x 10(exp -5) m(exp -1) calculated from Mie scattering theory. Nephelometer measurements gave a mean volume scattering coefficient of 8 x 10(exp -5) m(exp -1), and Mie theory calculations give a corresponding value of 1.2 x 10(exp -5) m(exp -1). From the photoacoustic spectroscopy and nephelometry measurements, a single-scattering albedo of 0.65 is implied for the carbon particles. Carbon aerosol samples were generated by atomizing a suspension of carbon black in alcohol, and carbon particle mass concentrations in the aerosol were determined by aethalometer analysis. From the known carbon mass concentrations in the aerosol, the detection limit of the longitudinally resonant spectrophone used for measuring the light absorption coefficient, beta(sub ab), was found to be 10(exp -5) m(exp -1) for a signal-to-noise ratio equal to one. This value corresponds to a carbon mass concentration detection limit of approximately 1 micro-g/cu m. Carbon particle size distributions were measured using a Single Particle Aerodynamic Relaxation Time Analyzer. The aerodynamic diameter of the carbon particles ranged from 0.59 to 0.66 microns with corresponding geometric standard deviations of 1.23 to 1.28. A morphological analysis of the carbon particles was done by scanning electron microscopy on samples deposited on filter substrates. This analysis showed carbon particles occurring as irregularly shaped agglomerates. The correlation between the carbon aerosol mass concentrations as measured by aethalometer analysis and light absorption coefficients measured by photoacoustic spectroscopy shows that the photoacoustic method can be used for monitoring atmospheric soot concentrations of airborne particles with measurement times less than 60 s. ON THE HIERARCHY OF PROCESSES CONTRIBUTING TO EQUATORIAL SPREAD F Ph.D. Thesis
David Lee Hysell 1992 419 p
Avail: Univ. Microfilms Order No. DA9300769

Unstable plasma stratification in the twilight equatorial F region ionosphere is subject to plasma instabilities known collectively as equatorial spread F. Small-scale irregularities in electron density give rise to coherent VHF and UHF radio scatter during spread F while in situ spacecraft detect intermediate- and large-scale plasma structures. We present data from observations made over three years at the Jicamarca Radio Observatory and from the summer 1990 CRRES/EQUIS campaign which involved the Cornell 50 MHz radar interferometer (CUPRI) and the Altair UHF radar at Kwajalein, MI. Radar findings are correlated with spread F data from sounding rockets launched during the EQUIS project and from the Atmospheric Explorer E satellite. A review of fundamental fluid theory for the ionospheric interchange instability emphasizes dissipative and non-local effects that restrict linear instability to intermediate-scale wavelengths. A nonlinear fluid theory incorporating three wave interactions extends the range of instability to transitional and small scales, and renormalization group analysis offers a way to evaluate enhanced transport due to these nonlinearly excited modes. At large scales, circumstantial evidence suggests that internal gravity waves seed plasma upwellings and initiate topside spread F. Density and electric field spectra measured by the spread F sounding rockets exhibit inertial-convective and inertial-diffusive subranges. A model of quasi one-dimensional plasma turbulence reproduces the spectral indices and breaking scales observed by the rockets. Density power spectra from 30 AE-E orbits also possess convective and diffusive subranges, but their characteristic scale sizes are about 10 times larger than the rocket's. One-dimensional rocket and satellite power spectra combine to form a two-dimensional spectral model of F region irregularities which predicts VHF radar scattering cross-sections. Seeking predictions for bottomside spread F coherent scatter Doppler spectra, we couple a particle-in-cell code to the intermediate scale plasma fluid simulation developed by Zargham and Seyler (1989). Our results distinguish between Doppler spectra and line-of-sight velocity distributions and suggest that there can be additional spectral broadening due to short growth times of the scattering waves. On the basis of new aspect sensitivity data from Jicamarca, we propose that collisional drift waves may join the nonlinear interchange mode as a source of 3 meter backscatter. Drift waves are linearly damped by ion-ion collisions at 3 meters, but a nonlinear, quasikinetic model predicts instability under certain conditions. Dissert. Abstr.

COUPLING AN OCEAN WAVE MODEL TO AN ATMOSPHERIC GENERAL CIRCULATION MODEL
Susanne L. Weber (Royal Netherlands Meteorological Inst., De Bilt.), Hans vonStorch, Pedro Viterbo (European Centre for Medium-Range Weather Forecasts, Reading, England.), and Liana Zambresky (GKSS-Forschungszentrum Geesthacht, Germany.) Sep. 1991 33 p
(Grant EPOC-0003-C)
(MPIM-72; ETN-93-93667) Avail: CASI HC A03/MF A01

A coupled model, consisting of an ocean wave model and an Atmospheric General Circulation Model (AGCM), is integrated under permanent July conditions. The wave model is forced by the AGCM wind stress, whereas the effect of the ocean waves is transferred to the AGCM in terms of modified fluxes of momentum and heat. Two aspects of the coupled model are investigated: whether the ocean wave fields are realistic and whether the atmospheric circulation is modified by the surface fluxes induced by the spatially and temporally varying wave field. The coupled model generates waves with mean wave height of 1 to 2 m in the Northern Hemisphere and in the tropics, and of more than 3 m in the Southern Hemisphere storm track. These compared favorably with observational data. Young wind sea, which is associated with enhanced surface fluxes, is generated in the storm track in the Southern Hemisphere, in the Northern Hemisphere subtropics and the Arabian Sea. The atmospheric circulation in the coupled experiment differs only in the Southern Ocean storm belt from the circulation in a control experiment without the wave model. The time mean meridional gradient of 500 hPa geopotential height is steepened. The high frequency variance, representative of baroclinic disturbances, is shifted poleward and is intensified at high latitudes. Young wind sea is

generated mostly in the equatorward 'frontal' area of a cyclone. The 'storm-wave interaction' hypothesis proposes that the inhomogeneous distribution of surface roughness below a cyclone accelerates the poleward movement of cyclones. At the same time the cyclones live longer, or they become more frequent. Thus, the process of generating ocean waves is probably important for weather forecasting. ESA

A HYBRID COUPLED TROPICAL ATMOSPHERE OCEAN MODEL: SENSITIVITIES AND HINDCAST SKILL
Richard Kleeman (Bureau of Meteorology, Victoria, Australia.), Mojib Latif, and Moritz Fluegel Jan. 1992 38 p
(MPIM-76; ETN-93-93760) Avail: CASI HC A03/MF A01

The behavior of a hybrid coupled model consisting of a simple atmospheric model and a tropical Pacific ocean general circulation model is examined. The atmosphere is a Gill type dynamical model forced by latent heating determined from a moisture equation. The model is shown to oscillate for suitable choices of the coupled strength and this oscillatory behavior is analyzed with a view to determining mechanisms. Evidence is presented that the phase reversal from warm to cold involves the formation of a 'dipole pattern' of opposite signed sea surface temperature between the eastern and central Pacific. The cold eastern water is then advected westward causing the termination of the 'warm event'. Central to the formation of the dipole pattern in the coupled oscillation, is the strong local oceanic response to easterly atmospheric anomalies in the eastern Pacific and weak remote response there to strong central Pacific westerlies. The model is examined for forecast skill using a large ensemble of two year hindcasts. The relationship between this skill and the mechanisms elucidated in the oscillatory case is discussed. ESA

THE JOINT NORMAL MODES OF THE COUPLED ATMOSPHERE-OCEAN SYSTEM OBSERVED FROM 1967 TO 1986
Jin-Song Xu Jan. 1992 44 p
(MPIM-78; ETN-93-93672) Avail: CASI HC A03/MF A01

Two aspects of the Principal Oscillation Pattern (POP) analysis are used to study the joint normal modes of the coupled atmosphere-ocean system from a combined dataset including both atmospheric (sea level pressure, 700 mb and 200 mb zonal wind) and oceanic (sea surface temperature, Pacific sea level and Pacific subsurface temperature) parameters. The first aspect is that the POP's can be considered as normal modes of the analyzed system. Because of the complexity of the coupled systems, a straightforward method of studying these normal modes is to estimate them from the data. The second aspect of the POP analysis is that it can be considered as a multivariate spectral analysis. The spectral types of the modes are byproducts of the POP analysis. Six joint normal modes of the coupled atmosphere-ocean system are found. For Mode 1, 2 and 3 whose spectra are white or nearly white, the atmosphere plays an important role. The associated oceanic anomalie seem to be generated by the anomalous atmospheric conditions. For the other modes which have most of their power in much longer time scales, the ocean is more actively involved. Modes 4 and 5 describe decadal time scale variations. Mode 4 is characterized by changes in Sea Surface Temperature (SST) in all three tropical oceans, and in organized convection over the west Pacific. The results gave speculation that these tropical features might excite changes in the extratropical tropospheric and oceanic circulations. Mode 5 shows global scale SST anomalies and large anomalies in the Southern Hemispheric circulation. Mode 6 is the only oscillatory normal mode found in the coupled atmospheric-ocean system, it describes the quasi-cyclic behavior of the El Nino/Southern Oscillation (ENSO) phenomenon. ESA

RELATIONSHIP OF HEIGHT GRADIENTS OF PASSIVE ATMOSPHERIC PROPERTIES TO THEIR VARIANCES: APPLICATIONS TO THE GROUND-BASED SENSING OF PROFILES
E. E. Gossard (Colorado Univ., Boulder.) Aug. 1992 29 p Sponsored by Naval Command, Control and Ocean Surveillance
(PB93-136497; NOAA-TR-ERL-448-WPL-64) Avail: CASI HC A03/MF A01

Ways of relating height profiles of mean atmospheric properties to their variances are compared. Assuming a horizontally homogeneous, time-stationary medium, all methods assert the proportionality of the variance of a property to the variance of the turbulent velocity in the medium, to the square of the height gradient of the mean, and to the inverse Vaisala-Brunt frequency squared. The paper examines the dependence of the proportionality factor on the Richardson number. Finally, the various options for retrieving humidity profiles and refractive index profiles from radar wind Profiler data are discussed, and reasons are given why a system that makes use of the acoustic backscatter as well as the radar backscatter is attractive. Gravity waves play a significant role in the transport of momentum, heat, and constituents in the terrestrial atmosphere. Due to mean-flow shear, the gravity wave critical layer is a locus of isentropic overturning, secondary convective instability, turbulence, and mean flow acceleration. These processes were simulated numerically in a two-dimensional model, and a convective saturation hypothesis for breaking gravity waves was confirmed. The role of parameterized wave transport in the quasi-biennial oscillation, and effects of angular momentum advection by the mean meridional circulation, were also addressed. GRA

An important aspect of the U.S. Department of Energy's Atmospheric Studies in Complex Terrain (ASCOT) program is the development and evaluation of numerical models that predict transport and diffusion of pollutants in complex terrain. Operational mesoscale modeling of the transport of pollutants in complex terrain will become increasingly practical as computational costs decrease and additional data from high-resolution remote sensing instrumentation networks become available during the 1990s. Four-dimensional data assimilation (4DDA) techniques are receiving a great deal of attention recently not only to improve the initial conditions of mesoscale forecast models, but to create high-quality four-dimensional mesoscale analysis fields that can be used as input to air-quality models. In this study, a four-dimensional data assimilation technique based on Newtonian relaxation is incorporated into the Colorado State University (CSU) Regional Atmospheric Modeling System (RAMS) and evaluated using data taken from one experiment of the 1991 ASCOT field study along the front range of the Rockies in Colorado. The main objective of this study is to compare the observed surface concentrations with those predicted by a Lagrangian particle dispersion model and to demonstrate the effect of data assimilation on the simulated plume. In contrast to previous studies in which the smallest horizontal grid spacing was 10 km (Stauffer and Seaman, 1991) and 8 km (Yamada and Hermi, 1991), data assimilation is applied in this study to domains with a horizontal grid spacing as small as 1 km. EARTH'S MYSTERIOUS ATMOSPHERE. ATLAS 1: TEACHERS GUIDE WITH ACTIVITIES
Nov. 1991 73 p
(NASA-EP-282; NAS 1.19:282) Avail: CASI HC A04/MF A01

One of our mission's primary goals is to better understand the physics and chemistry of our atmosphere, the thin envelope of air that provides for human life and shields us from the harshness of space. The Space Shuttle Atlantis will carry the ATLAS 1 science instruments 296 km above Earth, so that they can look down into and through the various layers of

the atmosphere. Five solar radiometers will precisely measure the amount of energy the Sun injects into Earth's environment. The chemistry at different altitudes will be measured very accurately by five other instruments called spectrometers. Much of our time in the cockpit of Atlantis will be devoted to two very exciting instruments that measure the auroras and the atmosphere's electrical characteristics. Finally, our ultraviolet telescope will probe the secrets of fascinating celestial objects. This Teacher's Guide is designed as a detective story to help you appreciate some of the many questions currently studied by scientists around the world. Many complex factors affect our atmosphere today, possibly even changing the course of global climate. All of us who live on Earth must recognize that we play an ever-growing role in causing some of these changes. We must solve this great atmospheric mystery if we are to understand all these changes and know what to do about them. Author (revised)

NORMAL MODES OF THE ATMOSPHERE AS ESTIMATED BY PRINCIPAL OSCILLATION PATTERNS AND DERIVED FROM QUASI-GEOSTROPHIC THEORY
Reiner Schnur, Gerhard Schmitz (Rostock Univ., German D.R..), Norbert Grieger (Rostock Univ., German D.R..), and Hans vonStorch Mar. 1992 46 p
(MPIM-81; ETN-93-93675) Avail: CASI HC A03/MF A01

The Principal Oscillation Pattern (POP) analysis is a technique to empirically identify time dependent spatial patterns in a multivariate time series of geophysical or other data. In order to investigate medium scale and synoptic waves in the atmosphere it was applied to tropospheric geopotential height fields. The data was subjected to zonal Fourier decomposition and to time filtering so that variations with periods between 3 and 25 days were retained. Analyses were performed separately for each zonal wavenumber 5 to 9 on both hemispheres in Winter. The most significant POP's are very similar in time and spatial structure to the most unstable waves in the stability analysis. They describe the linear growth phase of baroclinic, unstable waves which propagate eastward with periods of 3 to 7 days. Since the POP's are purely derived from observations the results indicate the appropriateness of the assumptions usually made in linear stability analysis of zonally symmetric flows to explain high frequency atmospheric fluctuations. The POP Analysis reveals patterns which are not found in the linear stability analysis. These can possibly be attributed to the nonlinear decay phase of baroclinic waves. Eliassen-Palm cross sections help to clarify the interpretation of the POP's in terms of the life cycle of nonlinear baroclinic waves. ESA

ON REGIONAL SURFACE FLUXES OVER PARTLY FORESTED AREAS
Martin Claussen and Wim Klaassen (Groningen Rijksuniv., Netherlands.) May 1992 15 p
(MPIM-82; ETN-93-93676) Avail: CASI HC A03/MF A01

Neglection of air flow into and from the edges of tall vegetation appears to result in a severe understanding of local advection. In a regional scale, this 'edge effect' leads to an increase of momentum flux, whereas the sign of change varies for the heat fluxes. A heuristic model showing that the edge effect can be attributed to form drag at tall vegetation is presented. It is hypothesized that the regional momentum flux should be evaluated from an effective roughness length which implicitely accounts for the form drag, whereas the regional heat fluxes should be determined from local surface parameters. The fair agreement of results from a one dimensional model, which is based on the above reasoning, and a two dimensional, multilayer model of vegetation, supports the hypothesis. ESA

ON THE COLD START PROBLEM IN TRANSIENT SIMULATIONS WITH COUPLED ATMOSPHERE-OCEAN MODELS
Klaus Hasselmann, Robert Sausen (Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Oberpfaffenhofen, Germany.), Ernst Maier-Reimer, and Reinhard Voss (Hamburg Univ., Germany.) May 1992 27 p Sponsored by Commission of European Communities; Max-Plank-Geselschaft; Frie und Hansestadt Hamburg; and DLR
(MPIM-83; ETN-93-93677) Avail: CASI HC A03/MF A01

Using linear response theory, a general expression for the cold start error in transient numerical experiments with coupled atmosphere-ocean general circulation models is derived. The theory is applied to the Hamburg CO2 scenario simulations. An attempt to estimate the global mean temperature response function of the coupled model from the response of the model to a CO2 doubling was unsuccessful because of the nonlinearity of the system. However, an alternative derivation based on the transient simulation itself yielded a cold start error which was able to explain the initial retardation of the Hamburg global warming curve relative to the IPCC (Intergovernmental Panel on Climate Change) results obtained with a simple box diffusion-upwelling model. In the case of the sea level the behavior of the model is apparently more ideal. The cold start error estimations based on a CO2 doubling experiment and on an experiment with gradually increasing CO2 (Scenario A) are very similar and explain about two thirds of the coupled model retardation relative to the IPCC results. THE QUASI-BIENNIAL OSCILLATION IN THE MIDDLE ATMOSPHERE Ph.D. Thesis
Sarah Louise Ruth 1991 192 p
Avail: Univ. Microfilms Order No. BRD-97302

The quasi-biennial oscillation of equatorial zonal winds has a significant influence on other quantities such as temperature and the distribution of various chemical constituents at all latitudes throughout the stratosphere. The mechanisms through which the influence of the equatorial QBO spreads beyond the tropics are not well-understood. In this thesis, the current knowledge of the QBO is reviewed and attempts to address some of the remaining questions are described. The RAL/Cambridge two-dimensional model with an idealized parameterization of the equatorial QBO has been shown to reproduce many of the significant features of the observed tropical and extratropical QBO; however, the period of the modelled QBO tended to be unrealistically regular. In this study an alternative approach is described in which the modelled equatorial zonal wind is relaxed towards observed values. This produces a more realistic period and allows the modelled QBO in particular years to be compared with observations. In the results presented here there is particular emphasis on the signal in column ozone. There is good agreement with observations: the model captures the effects of the QBO over a range of latitudes and heights, including the important interaction with the annual cycle and by examining the modelled signal in mid latitudes it is also possible to infer accurately the relative severity of the Antarctic spring ozone depletion during most years. The two-dimensional model was also used to investigate aspects of the QBO in Antarctic ozone. The signal was found to be partly dynamical in origin, but appears to arise primarily out of a quasi-biennial modulation of chemical or thermal conditions within the vortex region. It was not possible to make a detailed study of these factors with the current model. In the final part of this thesis an analysis of the QBO signal in SAMS temperature data is presented. The annual and semi-annual cycles in these measurements were also studied and useful results obtained. Dissert. Abstr.

LIGHT EXTINCTION IN THE ATMOSPHERE
N. Laulainen Jun. 1992 34 p Presented at the IAU/ICSU/UNESCO Exposition in the Adverse Environment Impact on Astronomy, Paris, France, 30 Jun. - 2 Jul. 1992
(Contract DE-AC06-76RL-01830)
(DE93-005034; PNL-SA-21022; CONF-9206325-1) Avail: CASI HC A03/MF A01

Atmospheric aerosol particles originating from natural sources, such as volcanos and sulfur-bearing gas emissions from the oceans, and from human sources, such as sulfur emissions from fossil fuel combustion and biomass burning, strongly affect visual air quality and are suspected to significantly affect radiative climate forcing of the planet. During the daytime, aerosols obscure scenic vistas, while at night they diminish our ability to observe stellar objects. Scattering of light is the main means by which aerosols attenuate and redistribute light in the atmosphere and by which aerosols can alter and reduce visibility and potentially modify the energy balance of the planet. Trends and seasonal variability of atmospheric aerosol loading, such as column-integrated light extinction or optical depth, and how they may affect potential climate change have been difficult to quantify because there have been few observations made of important aerosol optical parameters, such as optical depth, over the globe and over time and often these are of uneven quality. To address questions related to possible climate change, there is a pressing need to acquire more high-quality

aerosol optical depth data. Extensive deployment of improved solar radiometers over the next few years will provide higher-quality extinction data over a wider variety of locations worldwide. An often overlooked source of turbidity data, however, is available from astronomical observations, particularly stellar photoelectric photometry observations. With the exception of the Project ASTRA articles published almost 20 years ago, few of these data ever appear in the published literature. This paper will review the current status of atmospheric extinction observations, as highlighted by the ASTRA work and augmented by more recent solar radiometry measurements. DOE

Quantitative examination of the seafloor surface roughness will be necessary for any design of equipment intended for use in collecting surface deposits such as cobalt-rich manganese crusts or nodules. Furthermore, it is an essential prerequisite to the confident interpretation of returns from high frequency side-scan and other acoustic systems. The objectives of the project were to develop the capability at the University of Hawaii of generating high resolution (less than 1 cm horizontal and vertical) topographic models of the seafloor from 35 mm stereo photographs; to produce such models from existing photographs of cobalt-rich manganese crust deposits; and to optimize the configuration of the existing Hawaii Undersea Research Laboratory (HURL) camera system for stereo photograph collection and correlation of acoustic data with the photographic ground-truth. These tasks were accomplished and have also led to the development of a follow-on project (MMTC/OBD Project 1512) dedicated to the simultaneous acquisition of both optical and side-scan acoustic data for future accurate determination of seabed microtopography. (DE93-004732; DOE/CH-9211) Avail: CASI HC A05/MF A01

The high resolution S-wave method has been developed to be a powerful tool in mapping subsurface lithology and in conducting groundwater investigations. The research has demonstrated that the resolution obtainable using S-waves in a Coastal Plain environment is more than double than that obtained using conventional reflection, which already offers a higher resolution than any other surface method. Where the mapping of thin clay layers functioning as aquitards or thin sand layers functioning as aquifers are critical to the understanding of groundwater flow, S-wave reflections offer unparalleled possibilities for nondestructive exploration. The field experiment at Cooke Crossroads, South Carolina enabled the detection and mapping of beds in the thickness range of one to three feet. The S-wave reflection technique, in combination with conventional P-wave reflection, has potential to directly detect confined and unconfined aquifers. This is a breakthrough technology that still requires additional research before it can be applied on a commercial basis. Aquifer systems were interpreted from the test data at Cooke Crossroads consistent with theoretical model. Additional research is need in assessing the theoretical response of P- and S-waves to subsurface interfaces within unconsolidated sediments of varying moisture content and lithology. More theoretical modeling and in situ testing are needed to bring our knowledge of these phenomena to the level that oil and gas researchers have done for fluids in sandstones. DOE

COMMERCIALIZATION OF ATOM INTERFEROMETERS FOR BOREHOLE GRAVITY GRADIOMETRY
John F. Clauser 30 Jan. 1993 5 p
(Contract DE-FG49-92CE-15500)
(DE93-006889; DOE/CE-15500/T1) Avail: CASI HC A01/MF A01

We perform a mathematical analysis of the tomography inversion problem for various configurations of a borehole gravity gradiometer. Our simulations typically call for logging a hole for about 4km of depth. Within the limits imposed by our presumed detector sensitivity, the device appears to be capable of measuring the 0.1 g/cu cm density in all rings to about 10 percent accuracy, with the rings extending out to about 500 meters from the hole. At this range, the vertical resolution has dropped to about 50m. Closer to the hole, the resolution improves so that we can determine the density in each of about 400 rings. We anticipate that this most important task (No. 1) will be complete within the next quarter. DOE

J. B. Griffiths Sep. 1992 14 p
(MATHS-Rept-A-178; ETN-93-93561) Avail: CASI HC A03/MF A01

The propagation of a gravitational wave in a stiff fluid is considered. The background region ahead of the wave is taken to be conformally flat. The gravitational wave is taken to have constant linear polarization. By obtaining a class of exact solutions in the form of a power series, it is shown that as the wave propagates into the fluid it is partially reflected and interaction terms also appear in the Weyl tensor. On interaction with the wave, the fluid begins to accelerate and shear, and its expansion is also modified. ESA

CHAOS THEORY AND ITS APPLICATION IN THE ATMOSPHERE Ph.D. Thesis
Xubin Zeng 1992 192 p
Avail: Univ. Microfilms Order No. DA9303910

Chaos theory, including the bifurcation and route to turbulence, and the characterization of chaos, is thoroughly reviewed. A practical method without adjustable free parameters was developed to compute the Lyapunov-exponent spectrum from short time series of low precision. The application of chaos is divided into three categories: observational data analysis, new ideas or insights inspired by chaos, and numerical model output analysis. Corresponding with these categories, three subjects are

studied. First, the fractal dimension, Lyapunov-exponent spectrum, Kolmogorov entropy, and predictability are quantitatively evaluated from observed daily data of surface temperature and pressure over regions of different climate signal/noise ratios. No low-dimensional attractors can be obtained from these observational data. The error-doubling time is 2 to 8 days at different locations. Second, chaos in daisyworld, which is an idealized ecosystem/atmosphere interactive model, was studied. Periodic and chaotic states are found when the parameter controlling the feedback between biota and their environment is changed. This raises important questions regarding the validity and interpretation of the Gaia hypothesis. Finally, two-and three-dimensional mesoscale and large-eddy simulations are performed to study in detail the initial adjustment process and error growth dynamics of surface thermally-induced circulations, including the sensitivity to initial and boundary conditions as well as to model parameters. The predictability as a function of the size of surface heat patches under calm synoptic wind is quantitatively evaluated. Two-and three-dimensional simulations yield close or similar results regarding the predictability. The predictability and the coherent circulations modulated by the surface inhomogeneities are also studied by computing the autocorrelations and power spectra. A low (less than 5)-dimensional attractor is obtained from the model output. Possible physical processes related to these low dimensions are discussed. Dissert. Abstr.

A SYSTEMATIC STUDY OF THE EFFECTS OF CRUST AND UPPER MANTLE STRUCTURE ON REGIONAL SEISMOGRAMS Report No. 1
Danny J. Harvey 1 Jun. 1992 33 p
(Contract F19628-90-K-0050)
(AD-A260231; PL-TR-92-2138) Avail: CASI HC A03/MF A01

As part of a broader effort to invert for Eurasian crust an upper mantle structure, a study was undertaken to-investigate the effects of structural model variations on regional synthetic seismograms. The intent is to produce regional synthetic seismograms that approximately match the observed data so that the inferred structural models can be used as starting points in a formal inversion procedure. Using laterally homogeneous structural models, the velocity-depth functions were systematically varied down to about 500 km depth and compared synthetic seismograms to data out to about 2000 km distance. Differential seismograms were used to infer relationships between structural parameters and the resulting seismograms. By using standard Eurasian crust and upper mantle structural models and introducing velocity randomization, it is possible to produce synthetic seismograms that show all of the regional phases complete with attendant coda. However, the synthetic seismograms show energetic P(sub g) and S(sub n) phases at distances above 1000 km that are often not present in the data. The S(sub n) phase can be reduced by suitable upper mantle velocity profiles. The reduction of P(sub g) in the synthetics is more difficult which indicates that lateral scattering may be reducing P(sub g) amplitudes without adversely affecting L(sub g). GRA

NONMIGRATING DIURNAL TIDES IN THE EQUATORIAL MIDDLE ATMOSPHERE Ph.D. Thesis
Ruth S. Lieberman 1992 225 p
Avail: Univ. Microfilms Order No. DA9239465

Data from the Nimbus 7 Limb Infrared Monitor of the Stratosphere (LIMS) are used to analyze the diurnal tides in the middle atmosphere. A novel aspect of this study is the emphasis on the relative importance of the nonmigrating components. These modes display a high degree of temporal variability during the LIMS observing period, and contribute substantially to the diurnal signal in wind and temperature. Their observed vertical phase variations are variable; however there is evidence for upward energy propagation. It has long been hypothesized that nonmigrating tides are driven by the diurnally-varying zonally asymmetric tropospheric heating constituents. This premise is examined by employing a linear tidal model to simulate the response of the atmosphere to realistic tidal drives. These quantities are calculated from the NCAR Community Climate Model. The large-scale CCM2 diurnal surface pressure, OLR and hydrology are well simulated under July and January conditions. The CCM2 diurnal fields of short-wave radiative, convective and diffusive PBL hearing are used as input to a linear tidal model with Newtonian cooling. This model successfully reproduces many observed features of the migrating and nonmigrating diurnal surface pressure tides at low latitudes. In the middle atmosphere, tropospheric solar heating is the dominant source of the migrating tide. The zonal means and eastward migrating wavenumber one components are also associated with radiative heating. The eastward migrating wavenumber three pattern is strongly linked to the dry and moist convective heating as well. The observed eastward migrating tides are harder to simulate, due in part to the failure of the linear model to incorporate the dissipative effects to which they are prone. Dissert. Abstr.

ATMOSPHERIC DETECTIVES: ATLAS 2 TEACHER'S GUIDE WITH ACTIVITIES. FOR USE WITH MIDDLE-SCHOOL STUDENTS
Nov. 1992 26 p
(NASA-EP-285; NAS 1.19:285) Avail: CASI HC A03/MF A01

Can you imagine doing a science project in space? This is the challenging and exciting situation that researchers experience in Spacelab, the laboratory carried inside the Shuttle. Here, hundreds of kilometers above Earth's surface, the crews of the ATLAS missions scan, probe, and measure concentrations of chemicals and water vapor in Earth's protective bubble. So far, one ATLAS crew has rocketed into the atmosphere, watching many sunrises and sunsets come and go while activating delicate instruments and conducting experiments that monitor the complicated interactions between the Sun, the atmosphere, and Earth. We, the crew of ATLAS 2, will continue this important work aboard the Space Shuttle. Together, we will gather data that will be compared with information from satellites, balloons, and instruments on the ground. As part of the National Aeronautics and Space Administration's (NASA's) contribution to Mission to Planet Earth, ATLAS 2 will help develop a thorough picture of the Sun's output, its interaction with the atmosphere, and the well-being of Earth's middle atmosphere. Because the health of the atmosphere is of vital importance to all Earth's inhabitants, everyone should be part of this investigation. You can be active participants in exciting and vital activities: recycling and practicing other conservation methods and gathering information to learn more about how you can keep our atmosphere healthy now, as students, and in the future as informed citizens, scientists, technicians, and mathematicians. A STUDY OF HIGH-LATITUDE AURORAL ARCS USING RADAR, OPTICAL, AND IN SITU TECHNIQUES Ph.D. Thesis
Loretta A. Weiss 1992 135 p
Avail: Univ. Microfilms Order No. DA9234446

Two experimental campaigns designed to study high-latitude auroral arcs have been conducted in Sonde Stromfjord, Greenland. The Polar Acceleration Regions and Convection Study (Polar ARCS) on February 26, 1987, consisted of a coordinated set of ground-based and sounding rocket measurements of a weak, sun-aligned arc within tne duskside polar cap, while the Rodeo 1 and 2 experiments, conducted during December, 1988 and October, 1989, involved uniquely coordinated optical and radar measurements of high-latitude arcs occurring at the poleward boundary of the auroral oval. Analysis of the large-scale Polar ARCS data indicate anti-sunward convection in the region between the dusk-side auroral oval and the sun-aligned arc. This convection signature is consistent with either a model in which the sun-aligned arcs formed on open field lines over the polar cap or on closed field lines threading an expanded low-latitude boundary layer, but not a model in which the polar cap arc field lines map to an expanded plasma sheet. Electron measurements indicate that the rocket passed through three narrow (less than or equal to 20 km) regions of low-energy (less than or equal to 100 eV) electron precipitation. An

electrodynamic analysis has shown the electric and magnetic field perturbations in these regions to be well correlated and associated with small-scale upward and downward field-aligned currents of 1-2 micro-A/sq m. The Rodeo measurements have been used to examine the aeronomic and electrodynamic characteristics of two optically stable arcs occurring at different magnetic local times and exhibiting different relationships to the polar cap/convection reversal boundary. The first case study is associated with a reversal from antisunward to sunward flow and also the boundary between open and closed field lines. In contrast, the second case study involved an arc with a much greater average precipitation energy and a significant cross-arc flow, evidenced by the radar measurements as well as the convective motion of a polar cap patch directly across the arc. Owing to the relative motion between the F-layer plasma and the arc precipitation, this arc is interpreted as forming across the nightside merging gap on field lines which map to a region of stable reconnection in the tail. Dissert. Abstr.

DEVELOP AN X-WINDOWS TOOL TO COMPUTE GAUSSIAN BEAM SYNTHETIC SEISMOGRAMS Semiannual Report No. 1, 23 Aug. 1991 - 4 Apr. 1992
J. P. Davis and Ivan H. Henson 4 Apr. 1992 18 p
(Contract F29601-91-C-DB04; ARPA Order 6731)
(AD-A260034; TGAL-92-03) Avail: CASI HC A03/MF A01

Two principal topics are discussed: an introduction in which the functional flow and the basic architecture of a prototype system for computing synthetic seismograms using the Gaussian Beam method are described, and a second section in which progress toward implementing that design is outlined. To maximize functionality, the design integrates as much as possible software already developed under the NMRD initiative: code for handling database transactions, inter-process communication, and graphical display of seismograms are assumed to exist. The system has two modules. The first provides X-Windows graphics to allow the user to construct and manipulate two-dimensional earth models, and also to trace the propagation of seismic waves through those models. The second module computes synthetic seismograms and/or calculates traveltimes for models constructed with the first. It has no graphical component. The raytracing capabilities of the program were found to be very fast, owing in part to the way the velocity model was parameterized. Several figures demonstrating model construction and raytracing are included. GRA

STUDY OF HIGH SPATIAL RESOLUTION NARROW SPECTRAL BAND ULTRAVIOLET IMAGES OF THE EARTH'S ATMOSPHERE Final Report, Feb. 1990 - Sep. 1992
John L. Lowrance 30 Sep. 1992 32 p
(Contract F19628-90-C-0052)
(AD-A260035; PSI-TM-9201; PL-TR-92-2239; AD-E201358) Avail: CASI HC A03/MF A01

The primary objective was the development of an ultraviolet sensitive television type camera that would be suitable for use on a polar orbiting satellite to obtain high spatial resolution narrow spectral band images of the earth's atmosphere in the 125 to 320 nm wavelength region. An ultraviolet camera with high spatial resolution was designed for the AURA payload. After the first year, emphasis shifted to ground based UV observations when funding for a space borne UV Imager was not foreseen in the near future. The existing ground based UV Imager was upgraded and used to observe rocket launches and e-beam excitation of the ionosphere. In 1992, a Princeton Scientific Instruments Digital CCD Camera System was modified and used successfully for ionospheric observations as a part of the Combined Release and Radiation Effects (CRRES) program, a multi-instrument program to observe sounding rocket releases of barium into the ionosphere. Melton (Pacific Northwest Lab., Richland, WA.), A. P. Campbell (Argonne National Lab., IL.), Donna M. Edwards (Sandia National Labs., Livermore, CA.), Paul Kanciruk, and Paul T. Singley 1992 6 p Presented at the Scientific Data Management Workshop '92, Salt Lake City, UT, 3-5 Nov. 1992
(Contract DE-AC05-84OR-21400)
(DE93-002834; CONF-9211115-1) Avail: CASI HC A02/MF A01

The Atmospheric Radiation Measurement (ARM) Program is a Department of Energy (DOE) research effort to reduce the uncertainties found in general circulation and other models due to the effects of clouds and solar radiation. ARM will provide an experimental testbed for the study of important atmospheric effects, particularly cloud and radiative processes, and testing of parameterizations of the processes for use in atmospheric models. The design of the testbed known as the Clouds and Radiation Testbed (CART), calls for five, long-term field data collection sites. The first site, located in the Southern Great Plains (SGP) in Lamont, OK began operation in the spring of 1992. The CART Data Environment (CDE) is the element of the testbed which acquires the basic observations from the instruments and processes them to meet the ARM requirements. A formal design was used to develop a description of the logical requirements for the CDE. This paper discusses the design and prototype implementation of a part of the CDE known as the site operations log, which records metadata defining the environment within which the data produced by the instruments is collected. STRUCTURE AND DYNAMICS OF THE MAGNETOPAUSE Ph.D. Thesis
Zhi Wang 1992 269 p
Avail: Univ. Microfilms Order No. DA9303493

This thesis addresses several topics concerning the structure and dynamics of the magnetopause. These topics include the role of the magnetopause in global convection, the Kelvin-Helmholtz (K-H) instability, which accounts for momentum transport at the magnetopause, the formation of flux ropes by the tearing and twisting modes and particle diffusion across the magnetopause resulting from the destruction of magnetic surfaces. We first establish an analytic electric field model for an open magnetosphere and introduce a magnetopause to control the reconnection rate and momentum transport. A realistic magnetospheric configuration is realized by 'stretch transformation'. The role of magnetic nulls in the electric field is approached with a technique for direct calculation of electric fields along field lines. Results indicate that electric fields associated with A-type or B-type nulls are generally singular. We then consider kinetic effects on the K-H instability. Contrary to the logical assumption that Landau damping damps the instability, it can instead enhance the growth and increase the spatial extent of the instability because the heating of resonance particles enhances the pressure perturbation. We use a gravitational analogy to determine the effect of curvature on K-H instability and find that the critical Richardson number for stability increases from 1/4 for incompressible fluids to 1/2 for compressible fluids. The flux rope, which accounts for flux

transfer events (FTE), can be formed by a tearing or twisting mode. The tearing mode is self excited by the free energy associated with the magnetic configuration, while the twisting mode must be externally driven. The shear flow generates the twisting mode and reduces the growth rate of the tearing mode. The flux ropes resulting from the twisting mode closely resemble FTE's which have a longer pitch length than that from tearing mode. Particle diffusion across the magnetopause is addressed by considering the destruction of magnetic surfaces. The diffusion coefficient reaches 10(exp 9) m(exp 2)/s, which is critical for magnetopause boundary layer formation. The presence of regular magnetic surfaces at the edge of the current layer may account for the sharp transition that is often observed at the magnetopause. Dissert. Abstr.

PRECIPITATING AURORAL ELECTRON FLUX CHARACTERISTICS BASED ON UV DATA OBTAINED BY THE AIRS EXPERIMENT ONBOARD THE POLAR BEAR SATELLITE Final Report, Aug. 1988 - Jul. 1991
D. J. Strickland and R. J. Cox Mar. 1992 72 p
(Contract F19628-88-C-0113)
(AD-A260015; AD-E201368; PL-TR-92-2073) Avail: CASI HC A04/MF A01

The AIRS instrument on satellite Polar BEAR is the first to obtain narrow band UV images for more than one band at a time. This provides the opportunity to do serious quantitative analysis of the data in terms of composition and the energy sources producing the emission (aurora and dayglow). Analysis of auroral imaging data from two passes will be presented. On one of these, simultaneous images were obtained at 1356 A (OI 1356 A plus N sub 2 LBH), 1596 A (LBH), and 3914 A (N2(+) 1N). On the other, the observed bands were centered at 1304 A (OI 1304 A), 1544 A (LBH), and 3914 A. Variations in data ratios among the three bands for either pass exceeded a factor of three over the portion of the auroral oval seen within the images. The possible causes of these variations are changes in the hardness of the precipitating particle spectrum (here the particles are assumed to be electrons), changes in the abundance of O relative to N2, changes in the albedo at 3914 A, and statistical fluctuations where signals were low. To interpret the data, yields (Rayleighs/(erg cm(exp -2)s(exp -1))) and yield ratios appropriate to the band centers and their widths were calculated versus hardness of the precipitating electron spectrum. The calculations used MSIS model atmospheres with O density scalings of 1.0 and 0.5. The input parameters were appropriate to the times at which the data were collected to the regions observed. Incident electron spectra were characterized by modified Gaussian and Maxwellian energy distributions defined in terms of characteristic energy E sub o (in keV) and energy flux Q (in ergs cm(-2)s(-1)). ANALYSIS OF H2O INFRARED RADIANCE MEASURED DURING THE ELC-1 ROCKET EXPERIMENT Scientific Report No. 1
P. De and S. M. Adler-Golden 15 May 1992 26 p
(Contract F19628-91-C-0083)
(AD-A259986; AD-E201313; SSI-TR-213; PL-TR-92-2136) Avail: CASI HC A03/MF A01

This report presents an analysis of selected long-wavelength infrared (LWIR) limb radiance data measured in the ELC-1 radiometer experiment, launched on October 25, 1983, from the White Sands Missile Range, NM at local time 0426 hrs. From the CO2 nu(sub 2) band emission, information on the mesospheric profile and the radiometer absolute calibration is extracted. The results are combined with a measurement of water vapor rotational emission in the 23-29 micrometers region to derive a water vapor profile, accurate to within around a factor-of-two range, for 55 km - 85 km altitudes. The ELC-1 results are consistent with previous mid-latitude measurements, made by microwave and solar IR absorption techniques, during fall or early winter months, and are of comparable or better accuracy. These results demonstrate the feasibility of global long-range sensing of water vapor in the mesosphere from rotational emission data obtained in satellite experiments, including the CIRRIS-1A experiment flown on the Space Shuttle STS-39 in April, 1991. TEST AND EVALUATION OF NEURAL NETWORK APPLICATIONS FOR SEISMIC SIGNAL DISCRIMINATION Final Report, 1 Sep. 1990 - 31 Aug. 1992
Gagan B. Patnaik, Thomas J. Sereno, Jr., and Richard D. Jenkins 28 Sep. 1992 62 p
(Contract F19628-90-C-0156)
(AD-A260030; AD-E201342; SAIC-92/1191; PL-TR-92-2218-V-2) Avail: CASI HC A04/MF A01

This study describes the operational test and evaluation of two neural network applications that were integrated into the Intelligent Monitoring System (IMS) for automated processing and interpretation of regional seismic data. Also reported is the result of a preliminary study on the application of neural networks to regional seismic event identification. The first application is for initial identification of seismic phases (P or S) recorded by 3-component stations based on polarization data and context. This neural network performed 3-6 percent better than the current rule-based system when tested on data obtained from the 3-component IRIS stations in the former Soviet Union. This resulted in an improved event bulletin which showed that the number of analyst-verified events that were missed by the automated processing decreased by more than a factor of 2 (about 10 events/week). The second operational test was conducted on the neural network developed by MIT/Lincoln Laboratory for regional final phase identification (e.g., Pn, Pg, Sn, Lg, and Rg). This neural network performed 3.3 percent better than the rule-based system in IMS station processing. However, for the final phase identifications obtained after network processing (where data from all stations are combined), the gain dropped to about 1.0 percent. It is likely that this could be regained by using the neural network phase identification confidence factors in the network processing. Finally, our preliminary study on the application of neural networks to identify regional seismic events on the basis of coda shape gave about 80 percent accuracy on data recorded at GERESS. In general, the neural network classifier utilized the coda decay rate which was lower for the earthquakes than it was for the explosions, although there was substantial overlap. GRA

EMPIRICAL DETERMINATION OF THE EFFECTS OF CLOUDS ON THE EARTH'S RADIATION BUDGET OVER THE PACIFIC OCEAN Final Report, 15 Nov. 1990 - 31 Dec. 1992
Daniel Ziskin and Darrell F. Strobel 31 Dec. 1992 5 p

(Grant NAG5-1476)
(NASA-CR-192696; NAS 1.26:192696) Avail: CASI HC A01/MF A01

The main objectives of this research has been to learn how clouds interact with the Earth's Radiation Budget (ERB). This broad goal has been approached in three distinct ways. The first has been to analyze the direct effect cloud amount has on the radiative components of the ERB. The second has been to investigate the indirect effects clouds and water vapor may have on the climate as a feedback mechanism. And finally an attempt has been made to simulate the findings in a simple radiative-convective climate model. This report will summarize these three phases of the research. Derived from text

The Atmospheric Oxidation Computer Program (AOP) for estimating the second-order rate constant k(sub OH) for the reaction of an organic chemical with hydroxyl radicals in the gas-phase in the troposphere is reviewed. AOP is being used to regulate industrial chemicals under Sections 4 and 5 of the Toxic Substances Control Act. It describes the computerization of the structure/reactivity relationships of Atkinson of the University of California/Riverside by Syracuse Research Corporation. The only input needed to operate AOP is the SMILES notation, a computerized notation of the molecular structure of the chemical. The computer program will estimate k(sub OH) and the associated half life for the reaction of organic chemicals in the atmosphere. AOP will also list an experimental value of k(sub OH) if it is available in the scientific literature. Author (revised)

A numerical model to simulate chemical processes in the lower atmosphere, with special emphasis on ozone formation, is introduced. It is only necessary to consider chemical reactions in the gas phase. The model is used to simulate ozone formation in an urban area due to motor car emissions. The results illustrate the strong effect of hydrocarbon emissions in ozone production. The combined effects of horizontal transport, vertical diffusion, and chemical reactions are investigated on the regional scale. High ozone levels in nonindustrial areas are mainly due to the transport of ozone precursors. Simulation of a real episode shows the importance of the initial concentrations in the resulting ozone distribution. ESA

A SEMI-EMPIRICAL ANALYSIS OF STRONG-MOTION PEAKS IN TERMS OF SEISMIC SOURCE, PROPAGATION PATH, AND LOCAL SITE CONDITIONS
M. Kamiyama, M. J. ORourke, and R. Flores-Berrones 9 Sep. 1992 155 p Sponsored by NSF and New York State Science and Technology Foundation Prepared in cooperation with Rensselaer Polytechnic Inst., Troy, NY
(Contract NSF BCS-90-25010; NEC-91029)
(PB93-150266; NCEER-92-0023) Avail: CASI HC A08/MF A02

A new type of semi-empirical expression for scaling strong-motion peaks in terms of seismic source, propagation path, and local site conditions is derived. Peak acceleration, peak velocity, and peak displacement are analyzed in a similar fashion because they are interrelated. However, emphasis is placed on the peak velocity which is a key ground motion parameter for lifeline earthquake engineering studies. With the help of seismic source theories, the semi-empirical model is derived using strong motions obtained in Japan. In the derivation, statistical considerations are used in the selection of the model itself and the model parameters. Earthquake magnitude M and hypocentral distance r are selected as independent variables and the dummy variables are introduced to identify the amplification factor due to individual local site conditions. The resulting semi-empirical expressions for the peak acceleration, velocity, and displacement are then compared with strong-motion data observed during three earthquakes in the U.S. and Mexico. DIAGNOSTIC DETERMINATION OF BOUNDARY-LAYER CUMULUS CLOUDS USING HAPEX AIRCRAFT DATA
Q. Zhang 1992 4 p Presented at the 10th Symposium on Turbulence and Diffusion, Portland, OR, 29 Sep. - 2 Oct. 1992
(Contract DE-FG02-92ER-61361)
(DE93-002164; CONF-9209158-7) Avail: CASI HC A01/MF A01

Boundary-layer cumulus clouds play an important role in surface energy budget via the interaction between clouds and radiation. In turn, the formation and evolution of these clouds are dependent upon the boundary layer turbulence structure. In this study, HAPEX aircraft sounding and near-surface horizontal flight-leg data are used to calculate the distributions of the mixed-layer height, the lifting condensation level (LCL), the level of free convection, and the limit of convection level. The joint distributions of LCL and mixed-layer height, and LCL and near-surface virtual potential temperature are used to diagnose boundary-layer cumulus-cloud coverage, which then are compared with HAPEX airborne cloud observations. ICRCCM. PHASE 2: VERIFICATION AND CALIBRATION OF RADIATION CODES IN CLIMATE MODELS
R. G. Ellingson, W. J. Wiscombe, D. Murcray, W. Smith, and R. Strauch 1992 15 p
(Contract DE-FG05-90ER-60971)
(DE93-005114; DOE/ER-60971/3) Avail: CASI HC A03/MF A01

Following the finding by the InterComparison of Radiation Codes used in Climate Models (ICRCCM) of large differences among fluxes predicted by sophisticated radiation models that could not be sorted out because of

the lack of a set of accurate atmospheric spectral radiation data measured simultaneously with the important radiative properties of the atmosphere, our team of scientists proposed to remedy the situation by carrying out a comprehensive program of measurement and analysis called SPECTRE (Spectral Radiance Experiment). The data collected during SPECTRE form the test bed for the second phase of ICRCCM, namely verification and calibration of radiation codes used in climate models. This should lead to more accurate radiation models for use in parameterizing climate models, which in turn play a key role in the prediction of trace-gas greenhouse effects. This report summarizes the activities of our group during the project's Third year to meet our stated objectives. The report is divided into three sections entitled: SPECTRE Activities, ICRCCM Activities, and summary information. The section on SPECTRE activities summarizes the field portion of the project during 1991 and the data reduction/analysis performed by the various participants. The section on ICRCCM activities summarizes our initial attempts to select data for distribution to ICRCCM participants and at comparison of observations with calculations as will be done by the ICRCCM participants. The Summary Information section lists data concerning publications, presentations, graduate students supported, and post-doctoral appointments during the project. DOE

AN EXPERIMENTAL SEARCH FOR GAMMA RADIATION ASSOCIATED WITH THUNDERSTORM ACTIVITY

D. Fryberger Nov. 1992 8 p Presented at the 3rd International Symposium on Ball Lightning, Pasadena, CA, 28-30 Jul. 1992

(Contract DE-AC03-76SF-00515)

(DE93-006939; SU-SLAC-PUB-5980; CONF-9207177-1) Avail: CASI HC A02/MF A01

This experiment is a repeat of an earlier experiment, but with more sensitive apparatus and in a location with a higher incidence of thunderstorm activity. The earlier experiment was undertaken by Ashby and Whitehead to investigate the theory that ball lightning might be associated with the annihilation of small amounts of antimatter, and it yielded some very interesting but inconclusive results. In the course of about 12 months of data taking, four high rate bursts of gamma radiation were detected. These events lasted a few seconds and had many thousands of counts (16500, 5000, 3700, and greater than 7700). Unfortunately, the association of these gamma ray bursts with thunderstorms or ball lightning was not clearly established, although one of the bursts did occur during a local thunderstorm in rough coincidence with a lightning bolt striking a flagpole about 100 yards from the gamma ray detection crystals. A pulse height spectrum taken for this burst (no spectrum was taken for the other three) exhibited a significant peak, well above background, the energy of which appeared to be compatible with the 511 keV positron annihilation line. While the peak could not be unambiguously attributed to positron annihilation, this certainly appeared to be the most likely source. DOE

LOCAL LIGHTNING EARLY WARNING SYSTEM (LLEWS), PHASE 1

R. J. Fisher Dec. 1992 49 p

(Contract DE-AC04-76DP-00789)

(DE93-006609; SAND-92-2446-Phase-1) Avail: CASI HC A03/MF A01

Results are presented of a detailed survey of the present state of scientific understanding of cloud electrification processes and lightning warning technology. A review is given of the principles of operation and demonstrated performance factors of lightning strike location technologies and associated commercial products. Emphasis is given to the local lightning warning problem, which is divided into two categories: detection and tracking of active storms that originate outside of and move into the declared safety zone, and early detection of cloud electrification that initiates within the zone. A prototype single-station warning system design is presented that is intended to accumulate data simultaneously from a complement of different types of sensors during intervals immediately preceding the onset of lightning conditions within the area of coverage. The resultant data base will be analyzed statistically to identify the most promising combinations of early warning indicators and to quantify their reliability as a function of the warning intervals they provide. INVESTIGATION OF CLOUD/WATER VAPOR MOTION WINDS FROM GEOSTATIONARY SATELLITE Final Report

Mar. 1993 7 p

(Grant NAG8-892)

(NASA-CR-192274; NAS 1.26:192274) Avail: CASI HC A02/MF A01

This report summarizes the research work accomplished on the NASA grant contract NAG8-892 during 1992. Research goals of this contract are the following: to complete upgrades to the Cooperative Institute for Meteorological Satellite Studies (CIMSS) wind system procedures for assigning heights and incorporating first guess information; to evaluate these modifications using simulated tracer fields; to add an automated quality control system to minimize the need for manual editing, while maintaining product quality; and to benchmark the upgraded algorithm in tests with NMC and/or MSFC. Work progressed on all these tasks and is detailed. This work was done in collaboration with CIMSS NOAA/NESDIS scientists working on the operational winds software, so that NASA funded research can benefit NESDIS operational algorithms. Author

A CONVECTIVE DRAG THEORY FOR SURFACE FLUXES

R. B. Stull 1992 4 p Presented at the 10th Symposium on Turbulence and Diffusion, Portland, OR, 29 Sep. - 2 Oct. 1992

(Contract DE-FG02-92ER-61361)

(DE93-004037; CONF-9209158-10) Avail: CASI HC A01/MF A01

Concluding remarks are as follows: (1) weather and climate forcast models that might not have fine enough grid spacing to resolve the survace layer can utilize mixed-layer quantities in the parameterization proposed here; and (2) remote sensors such as satellite-borne radiometers or ground-based high-spectral-resolution interferometer spectrometers (HIS) can use radiometric data to estimate fluxes. REGIONAL-SCALE ANALYSIS AND FORECASTING Final Report, May 1991 - Sep. 1992

John Burgeson, Isidore Halberstam, Christopher Redder, and Ralph Shapiro Sep. 1992 182 p Prepared in cooperation with Hughes STX Corporation, Lexington, MA

(Contract F19628-89-C-0167)

(AD-A259894; STC-TR-2660; PL-TR-92-2227) Avail: CASI HC A09/MF A02

This final report completes the description, begun in the interim report, of the development of the regional-scale analysis and forecasting procedure (RAP). The RAP is based on multivariate optimum interpolation of observations selected rigorously by the forward stepwise regression procedure. The complete observation set undergoes a unique buddy check that carefully eliminates those observations that adversely affected the analysis. The scheme used regionally-developed univariate and bivariate forecast error correlations, which were a function of distance between observations. The models are stratified by region, season, standard atmospheric levels, and forecast lengths. The models are superior to the model described in the interim report, and the models are shown to be applicable to rawinsonde and satellite observations. Results of verification experiments with numerical analyses of real data showed that the RAP concept is viable. Observing system simulation experiments (OSSEs) further verified the quality of RAP and the validity of the developed correlation models. In addition, the OSSEs provided relative confidence estimates of the quality of RAP analyses. An interesting forecasting procedure was recommended that extended the RAP analyses into a short-range forecast. GRA

PROGNOSTIC CLOUD WATER IN THE LOS ALAMOS GCM
J. E. Kristjansson and C. Y. J. Kao 1992 4 p Presented at the 4th AMS Symposium on Global Change Studies, Anaheim, CA, 14-19 Jan. 1993
(Contract W-7405-eng-36)
(DE93-000679; LA-UR-92-3029; CONF-930142-3) Avail: CASI HC A01/MF A01

In recent years the effect of clouds has emerged as the largest single source of uncertainty in predicting climate changes. Consequently, the treatment of clouds in general circulation models (GCM's) is receiving greater attention than before. The cloud treatment in most of today's GCM's is greatly simplified. An elaborate cloud treatment including prognostic cloud water is introduced in the Los Alamos GCM and the sensitivity of climate simulations investigated. DOE

METHOD OF MEASURING NIGHTTIME U-VALUES USING THE MOBILE WINDOW THERMAL TEST (MoWiTT) FACILITY
J. H. Klems Apr. 1992 18 p Presented at the 1992 American Society of Heating, Refrigerating, and Air-Conditioning Engineers Meeting, Baltimore, MD, 27 Jun. - 1 Jul. 1992
(Contract DE-AC03-76SF-00098)
(DE93-004778; LBL-30032; CONF-9206112-4) Avail: CASI HC A03/MF A01

Although primarily designed for studying the dynamic net energy flows through fenestration systems over the full diurnal cycle, the Mobile Window Thermal Test (MoWiTT) Facility is also frequently used to measure nighttime U-values. These measurements have the advantage of incorporating the exterior film coefficient resulting from the true ambient conditions at a particular time and location, rather than relying on a laboratory simulation of some assumed average or extreme condition. On the other hand, the MoWiTT is a much more complicated facility than a laboratory hot box, and the number of potential error sources is correspondingly larger. The method of deriving the nighttime U-value from directly measured data and the effect of random and systematic errors are discussed. DOE

PLAN FOR THE EVALUATION OF THE PROTOTYPE TERMINAL DOPPLER WEATHER RADAR (TDWR) SYSTEM
Baxter R. Stretcher Feb. 1993 22 p
(DOT/FAA/CT-TN92/44) Avail: CASI HC A03/MF A01

The purpose of this plan is to detail the procedural approach and methods to be employed in evaluating the air traffic control (ATC) interface of the prototype Terminal Doppler Weather Radar (TDWR) system. The plan describes the evaluation that will be performed at the Orlando International Airport (MCO) during the summer of 1992. The Federal Aviation Administration (FAA) Technical Center will be interested in the controller's and supervisor's evaluation of the Geographical Situation Display (GSD) and the Ribbon Display Terminal (RDT), installed at the ATC tower. The evaluation of these displays may determine the operational suitability of the TDWR in the National Airspace System (NAS). Author

AIR TRAFFIC OPERATIONAL EVALUATION PLAN FOR THE PROTOTYPE AIRPORT SURVEILLANCE RADAR WIND SHEAR PROCESSOR (ASR-WSP) AT ORLANDO INTERNATIONAL AIRPORT
Radame Martinez Feb. 1993 17 p
(DOT/FAA/CT-TN92/45) Avail: CASI HC A03/MF A01

The Airport Surveillance Radar Wind Shear Processor (ASR-WSP) (also known as Airport Surveillance Radar-9 (ASR-9) modification for low altitude wind shear detection) is a production ASR-9 with an expanded weather channel for added processing capabilities. The primary mission of the ASR-WSP is to enhance the safety of air travel through the timely detection and reporting of hazardous wind shear in and near the terminal approach and departure zones of the airport. It will also improve the management of air traffic (AT) in the terminal area through the forecast of precipitation, and ultimately the detection of other hazardous weather phenomena. The ASW-WSP may be used as a stand-alone system at airports without a Terminal Doppler Weather Radar (TDWR) or Enhanced-Low Level Wind Shear Alert System (E-LLWAS), or in an integrated mode with either, or both, the TDWR and E-LLWAS. This plan outlines the Federal Aviation Administration's (FAA) operational evaluation of an ASR-WSP which will operate at Orlando International Airport (MCQ) during the summer of 1992. Data will be collected via questionnaires completed by air traffic controllers and supervisors. The results of the evaluation will be analyzed and any necessary changes will be made prior to full production. Author

NESTED GRID MODEL PERFORMANCE DURING COLD OFFSHORE AND WARM ONSHORE FLOW OVER THE GULF OF MEXICO
Paul R. Janish and Steven W. Lyons Oct. 1992 24 p
(PB93-108090; NOAA-TM-NWS-SR-144) Avail: CASI HC A03/MF A01

During the cool season, cold air outbreaks push into the southern United States, across the Gulf coast, and into the Gulf of Mexico. The cycle of cold air outbreak and return flow over the Gulf of Mexico has been defined by Crisp and Lewis (1992) as the return flow cycle. The cycle involves two distinct phases. The first phase of the cycle, known as the offshore flow phase, is defined as the movement of cold/dry air from the continent to the ocean. The second is defined as the movement of warmer/more moist air from the ocean to the continent and is called the onshore (or return) flow phase. The importance of the return flow cycle cannot be overemphasized. Forecasts of temperature, humidity, clouds, and precipitation along the Gulf Coast and farther north are directly dependent upon accurate predictions of air mass modification over the Gulf. Operational forecasters depend heavily on outputs from numerical weather prediction models in preparing their daily suite of products. Since correct simulations of the return flow cycle are critical, an evaluation of Nested Grid Model (NGM) performance was conducted during the cool season of 1988. Emphasis was placed on determining model strengths and weaknesses during the return flow cycle. Dissert. Abstr.

A STATISTICAL CHARACTERIZATION OF DENVER-AREA MICROBURSTS Final Report
Kimberly L. Elmore and John McCarthy Dec. 1992 56 p Sponsored in part by NCAR and NSF
(Contract DTFA01-82-Y-10513)
(DOT/FAA/NR-92/13) Avail: CASI HC A04/MF A01

This document describes statistical characteristics of microbursts that occurred in the Denver area during the summers of 1982 and 1984. The Joint Airport Weather Studies (JAWS) Project, conducted between 15 May and 13 August 1982, is the primary data source for this report, and radar data from the Classify, Locate and Avoid Wind Shear (CLAWS) Project are also included for microburst lines and low-reflectivity microbursts. All surface mesonet data come from the JAWS Project. This report describes the statistical characteristics of the JAWS and CLAWS data that have been analyzed to date and is intended to be used as a working document. It is primarily a compendium of several different sources brought together in a single document. Author

THE STRUCTURE AND ENERGETICS OF AMAZON SQUALL LINES Ph.D. Thesis
Harold Lloyd Massie, Jr. 1991 211 p
Avail: Univ. Microfilms Order No. DA9237649

The role of the Amazon Basin as a global center of action for deep convection is quantified in the context of the planet's heat balance. Mesoscale heat and moisture budgets are presented for three synoptic-scale coastal originating systems (COS) over the Amazon Basin during the 1987 wet season. The budgets are obtained from volumetric analyses of mesoscale rawinsonde data from the April-May 1987 Amazon Boundary Layer Experiment (ABLE-2B). Classification of cloud and rainfall components is based on data from Portable Automated Mesonet (PAM) towers, GOES images, and radar. Satellite measurements of the total active cloud area, coupled with the mesoscale budget calculations, are used to determine the system-wide vertical transport of heat as a function of the COS life cycle. Maximum heat transport occurs in the COS mature stage when the system has its maximum spatial extent. The instantaneous heat transport for the 300-100 mb layer in a mature COS equals nearly 20 percent of

the theoretical heat export requirement for the equatorial trough zone. A little more than half of the system-wide transport occurs in the dynamically active anvil cloud. Dissert. Abstr.

CLOUD INFLUENCE ON RADIATIVE COOLING OVER THE TIBETAN PLATEAU DURING THE SUMMER MONSOON PERIOD Ph.D. Thesis
Lei Shi 1992 172 p
Avail: Univ. Microfilms Order No. DA9233299

The spatial and temporal variations of tropospheric longwave cooling, shortwave heating and cloud effects on these processes over the Tibetan Plateau during the summer monsoon season of 1988 are studied using infrared and visible measurements from the Indian geosynchronous satellite (INSAT). Estimates of surface temperature, surface albedo, cloud amount, cloud height, cloud water content, and effective radius of cloud drops are incorporated in a 27-band infrared model and a 38-band solar model to calculate radiative divergence profiles. The effects of cloudiness are parameterized in terms of water/ice contents and effective radius. Cloud effective radius is obtained through an optimization scheme which minimizes the top-of-atmospheric shortwave flux differences between INSAT visible measurements and estimates from the solar model. A theoretically consistent parameterization scheme is developed for calculating the cloud asymmetry parameter as a continuous function of wavelength and effective radius. The mean radiative effect of cloudiness over the large-scale elevated plateau during the course of the summer monsoon is to cool the atmosphere. However, the cooling takes place by virtue of cloud-induced longwave cooling dominating cloud-induced shortwave heating. This is completely opposite of the conventional view in which cloud causes infrared warming and solar cooling. Vertically, cloud-induced radiative cooling is strongest in the middle troposphere with weaker cooling rates in the lower troposphere. Therefore, clouds contribute indirectly to an increase in atmospheric heating through reducing static stability and thus aid the release of latent heat by cloud systems. Plateau radiative cooling rates vary significantly through different monsoon phases, primarily due to variations in cloud forcing.

THEORETICAL ERRORS ON AIRBORNE MEASUREMENTS OF: STATIC PRESSURE, IMPACT TEMPERATURE, AIR FLOW ANGLE, AIR FLOW SPEED
Philippe Nacass Nov. 1992 75 p Sponsored by National Science Foundation, Washington, DC
(PB93-136406; NCAR/TN-385+STR) Avail: CASI HC A04/MF A01

The measurement of the surface pressure distribution on the nose of an aircraft (Brown et al, 1983) from which the dynamic pressure and angles of attack and sideslip can be obtained, defines the velocity vector of the aircraft relative to the atmosphere. In this report, a complete theory development gives an exact calculation for all angles with irrotational flow around a sphere, the easiest shape for a nose radome. But when a hemisphere is fixed on a long cylindrical portion the calculations of overspeed and pressure coefficient of the whole sphere are only approximations. Thus, an error is made in the measurements of the surface pressure distribution on the aircraft radome and on the angles of attack and sideslip. Most authors consider that the pressure coefficient is equal to zero on inlet sensors. GRA

APPLICATION OF SPATIALLY AVERAGING OPTICAL TECHNIQUES TO THE STUDY OF SHORT-TERM FLUX CHANGES ASSOCIATED WITH CLOUDS
W. Porch, F. Barnes, M. Buchwald, J. Stephens, J. A. Archuleta, and K. Kunkel (Illinois State Water Survey, Champaign.) 1992 7 p Presented at the 4th American Meteorological Society (AMS) Symposium on Global Change Studies, Anaheim, CA, 14-19 Jan. 1993
(Contract W-7405-eng-36)
(DE93-000690; LA-UR-92-2960; CONF-930142-2) Avail: CASI HC A02/MF A01

Cloud formation remains one of the largest uncertainties in Global Circulation Models (GCMs). Most GCM's predict fewer clouds and positive feedback under increased greenhouse gas conditions. However, cloud formation occurs on much smaller scales than GCMs can resolve and is intimately tied to small scale fluxes of heat, water vapor, and cloud condensation nuclei. It is critical to understand how values of these fluxes are distributed is space and time before reliable cloud parameterizations can be expected in GCMs. We describe in this volume an experiment designed to improve our understanding of how point measurements of heat, water vapor, and surrogate parameters scale to regional differences in land use (on the order of 10 to 20 km in irrigated agricultural and prairie grassland). Our role was to explore the use of optical techniques to provide spatially-averaged flux and wind convergence measurements and relate these to cloud variability. DOE

SHADOW TECHNIQUE FOR IMPROVED INVERSION OF LIDAR DATA TO CIRRUS AND CONTRAIL OPTICAL DEPTH
Gerhard H. Ruppersberg (Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Oberpfaffenhofen, Germany.) and Wolfgang Renger (Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Oberpfaffenhofen, Germany.) Aug. 1992 21 p Transl. into ENGLISH of Invertierung der Lidarsignale von Cirrus und Kondensstreifen unter Nutzung des Schattenwurfes Original language document was announced as N92-14571
(ESA-TT-1263; DLR-FB-91-07; ETN-93-93585) Avail: CASI HC A03/MF A01; DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany HC

A striking feature of lidar images of back scattered signals from a cirrus cloud, received using an airborne upwardly measuring lidar system during the International Cirrus Experiment of 1989, is the shadowing by an underlying contrail. The lidar system can be calibrated with the aid of this shadowing, so that the extinction coefficients in the contrail are yielded with an accuracy of +/- 20. A spatial variation in their sigma/beta value in the contrail can be localized accordingly and determined quantitatively. The extinction coefficients in the measurement region outside the shadowing layer is obtained after making an assumption concerning the sigma/beta values effective there in relation to a sigma/beta relationship on the shadowing layer. This 'shadow calibration' can provide effective support for the frequently used Klett technique. The calibration is also conceivable for a fixed, vertically sounding lidar system, and permits novel interpretations in the case of downwards lidar soundings of the atmosphere. ESA

REAL-TIME FORCASTS FOR WISP-91 USING THE PENN STATE/NCAR MESOSCALE MODEL
Phillip L. Haagenson, David O. Gill, and Ying-Hwa Kuo Oct. 1992 53 p Sponsored by National Science Foundation, Washington, DC
(PB93-118586; NCAR/TN-380+STR) Avail: CASI HC A04/MF A01

During the period from 1 January through 3 April 1991, researchers in the Winter Icing and Storms Project (WISP-91) used the Penn State University/National Center for Atmospheric Research (PSU/NCAR)

mesoscale numerical model (MM4) to provide high-resolution forecasts of the airflow, liquid water, and precipitation fields in the Front Range area of Colorado. Twenty-five pairs of 36-h forecasts were generated, using two different analysis systems to isolate the impact of different initial conditions on the forecast product. One system (standard) employs a modified Cressman objective analysis. The other system, MAPS, is a 3-h intermittent data assimilation system consisting of synoptic and asynoptic-data ingest. A two-way interacting nested version of MM4 was employed, with a fine-grid interval of 30 km and a coarse-grid interval of 90 km. Each forecast required approximately 2.5 CPU hours on one processor of NCAR's Y-MP/864 supercomputer. The model output display included hourly convective and stable precipitation rates, and spatial distribution of q(sub c) and q(sub r). Author

THE VERTICAL PROFILE OF REFLECTIVITY AND ERRORS IN RADAR ESTIMATES OF RAINFALL Ph.D. Thesis
Warren R. Gray 1991 216 p
Avail: Univ. Microfilms Order No. BRDX97551

From an investigation of the errors invcIved in the estimation of surface precipitation by radar it becomes apparent that the Vertical Profile of Reflectivity (VPR) is the prime source of uncertainty. This project considers how operational radar data from 4 elevation angles out to a range of 75 km, can be used to develop estimates of the VPR. VPR information from several ranges has been composited using an eigenvector analysis method. Eigenvectors were formed from the 4 beam data, the primary eigenvectors then combined to form an estimate of the average VPR. The structure and amplitude of the secondary eigenvectors were found to be related to the location of the Bright Band (BB) and its time variations. The time series of the amplitudes of the primary eigenvectors provides a poor estimate of surface rainfall. Taking into account the second eigenvector improves the rainfall estimation, suggesting that the variation of height of the BB is important when estimating surface rainfall. The observed VPR is modelled with simple structure functions consisting of a linear decrease in reflectivity with height superimposed on a BB. The complete profile is described as a function of just 4 physically significant variables. The lowest radar beam data is corrected using the parameterized storm average profile. Following correction the bias of the average raingauge/radar comparison is reduced by 17.6 percent and the spread is decreased by 37.5 percent. However, the same method is less successful when applied to data averaged over half-hour intervals. A simple cloud physics model was developed in order to investigate the effects of variations in rainrate and environmental conditions. The profile is shown to be strongly dependent on rainrate, especially when 'observed' by radar. It is concluded that the VPR corrections based only on radar data can provide useful improvements to the estimation of 'storm averaged' precipitation. Dissert. Abstr.

SURFACE RADAR STUDIES OF RAIN ESTIMATION IN CORRELATION WITH INFRARED AND VISIBLE TECHNIQUES OF INSAT AND GOES-E GEOSTATIONARY SATELLITES Ph.D. Thesis
Aziz ur-Rahman Malik 1992 227 p
Avail: Univ. Microfilms Order No. DA9239665

This study explores further the application of the radar reflectivity and the derivation of the empirical relationship linking the rainfall parameters to the radar observables reflectivity (Z), differential reflectivity (Z(sub DR)) and attenuation (K), using exponential raindrop size distribution (N(D). The IR data in the range of 10.5-12.5 microns from INSAT-1B and 10.5-12.6 microns from GOES-E geosynchronous satellites have been used to estimate the rainfall rate using the technique by Stout, Martin and Sikdar (1979) in enhanced IR images. In case of INSAT, four months were processed to show the different variations in rainfall. The months chosen were July 85, October 85, January 86 and April 86. The rainfall estimations from GOES-E over the Florida peninsula were compared with raingage measurements and the accuracy of the rain estimations were discussed. We have observed that in general the satellite estimates are suggesting volumetric rainfall which is slightly less than that inferred from ground truth by actual rainfall observations as determined from raingages. A possible explanation is that the convective cycle for clouds over tropical lands may not be thoroughly inferred from satellite images due to 30-minutes interval between two images and because of the diurnal heating which tends to produce quite explosive convective development. The results suggested that the satellite convective daily rainfall estimation technique by Stout and Martin can provide rain estimates of considerably high utility on the convective scale when combined with the Scofield/Oliver (1977, 1978, and 1980) technique, especially for large and deep convective systems over tropical oceans as well as lands. Dissert. Abstr.

A SATELLITE-BASED RADAR WIND SOUNDER (RAWS) Ph.D. Thesis
Weizhuang Xin 1991 184 p
Avail: Univ. Microfilms Order No. DA9238732

The objective of this study is to investigate the application of Doppler radar systems for global wind measurement. A model of the satellite based radar wind sounder (RAWS) is discussed, and many critical problems in the designing, such as the antenna scan pattern, tracking the Doppler shift caused by satellite motion, and backscattering of radar signals from different types of clouds, are discussed along with their computer simulations. In addition, algorithms for measuring mean frequency of radar echoes, such as the FFT estimator, the covariance estimator, and the estimators based on autoregressive models, are discussed. Monte Carlo computer simulations were used to compare the performance of these algorithms. Anti-alias methods are discussed for the FFT and the autoregressive methods. Several algorithms for reducing radar ambiguity were studied, such as random phase coding methods and staggered PRF methods. Computer simulations showed that these methods are not applicable to the RAWS because of the broad spectral widths of the radar echoes from clouds. A waveform modulation method using the concept of spread spectrum and correlation detection was developed to solve the radar ambiguity. Radar ambiguity functions were used to analyze the effective signal-to-noise ratios for the waveform modulation method. The result showed that, with suitable bandwidth product and modulation of the waveform, this method can achieve the desired maximum range and maximum frequency of the radar system. Dissert. Abstr.

SOUTHWARD BURST MESOSCALE CONVECTIVE SYSTEMS: AN OBSERVATIONAL AND MODELING STUDY Ph.D. Thesis
David Jonathan Stensrud 1992 202 p
Avail: Univ. Microfilms Order No. DA9236905

Southward burst mesocale convective systems (MCSs) observed to have a component of motion in the upstream direction occurred over the southern Plains states of 11 and 12 May 1982. The MSCs are studied using observations and numerical simulations from the Penn State/National Center for Atmospheric Research mesoscale model. The large-scale flow creates a broad region of potential buoyant energy but owing to weak large-scale forcing for upward motion and a restraining inversion, convection only is initiated where lifting associates with mesoscale features is able to eliminate the inversion. A series of eastward moving MCSs develop sequentially and propagate across the moist tongue. Each system produces an outflow of cold downdraft air that spreads progressively farther south than that from the preceding system. This conceptual model of the development and evolution of convection is very different from traditional models where convection develops and propagates more or less in phase with traveling upperlevel disturbances. Two 12-h simulations are conducted, beginning at 1200 UTC 11 May and 0000 UTC 12 May, respectively, to evaluate the ability of the mesoscale model to reproduce this complex evolution of events. The model reproduces the timing of initial convective development very well, while it errs in regard to propagation rates and amount of convection. This is attributed to the model parameterization schemes having a greater influence on the evolution of convection when the large-scale forcing is weak. Thus, any inaccuracies in these schemes can easily lead to divergences of the simulation from the observations. The simulations also show that initial conditions created using only the large-scale observations are not sufficient to reproduce the events accurately. These initial conditions are modified to include mesoscale features, such as convective outflows, indicated in the surface and satellite data, but not well sampled by the upper-air observations. The improved initial conditions produce a much more reasonable simulation of the events, illustrating the importance of incorporating mesoscale features in model initial conditions when the large-scale forcing is weak. Including mesoscale features in model initial conditions is an unexplored aspect of present initialization schemes. Dissert. Abstr.

THE INFLUENCE OF VARIATIONS OF VEGETATION AND SOIL MOISTURE ON SURFACE WEATHER AND ATMOSPHERIC CIRCULATION Ph.D. Thesis
Runhua Yang 1992 231 p
Avail: Univ. Microfilms Order No. DA9234693

The influence of variations of vegetation and soil moisture on surface weather and atmospheric circulation is studied through the use of the Simple Biosphere Model (SiB) and the Center for Ocean-Land-Atmosphere interactions (COLA) GCM. Tests for the SiB sensitivity to the conversion of the forest to other short vegetation or bare soil were performed at Amazonian and Great Plains sites, and a North Wales spruce forest site respectively. The results show that deforestation has a significant influence on the local surface energy budget and surface weather. The influence is especially prominent at the Amazon and Great Plains sites, and larger in summer than in other seasons. The influence on the partitioning of surface incoming radiative energy is generally constrained by the local atmospheric boundary condition. The sensitivity of the COLA GCM to changes in initial soil wetness (ISW) is determined by repeating three 10-day model integrations with the same initial and boundary conditions as the control runs except the values of ISW, which are revised at 69 model grid points covering much of the continental U.S. It is found that the relations between the changes in the 5-day mean forecast surface air temperature/surface specific humidity and the changes in ISW depend upon vegetation type and the values of ISW, and can be approximated by regression equations. These relations are also confirmed with independent data. With the ISW revised based on these regression equations the surface forecasts of the revised runs are consistently improved. The spatial scale of the ISW anomaly determines the degree and range of the influence. The influence of a small regional ISW change is mainly confined to the local region and to low atmospheric levels. The influence on surface fluxes is strong and persists for more than one month, but the effects on precipitation are relatively weak, changeable, and complex, particularly when an interactive cloud scheme is used. It is found that the moisture flux from the Gulf of Mexico can ameliorate drought conditions in the Great Plains in agreement with previously published results. Dissert. Abstr.

CLIMATE VARIABILITY IN A COUPLED GCM. PART 1: THE TROPICAL PACIFIC
Mojib Latif, Andreas Sterl, Ernst Maier-Reimer, and Martina M. Junge Sep. 1991 58 p
(Grant EV4C-0035-D(B))
(MPIM-73; ETN-93-93668) Avail: CASI HC A04/MF A01

A 26 year integration was performed with a Coupled ocean-atmosphere General Circulation Model (CGCM). The oceanic part resolves all three oceans in the latitude band 70 deg north to 70 deg south, but is dynamically active only between 30 deg north and 30 deg south. The atmosphere is represented by a global low order spectral model. The coupled model was forced by seasonally varying insolation. Although the simulated time averaged mean conditions in both atmosphere and ocean show significant deviations from the observed climatology, the CGCM realistically simulated the interannual variability in the tropical Pacific. In particular, the CGCM simulates an irregular ENSO (El Nino/Southern Oscillation) with a preferred time scale of about 3 years. The mechanism for the simulated interannual variability in the tropical pacific is related to both the 'delayed action oscillator' and the 'slow SST (Sea Surface Temperature) mode'. It therefore appears likely that, either the modes can coexist or they degenerate to one mode within certain locations of the parameter space. Experiments with a coupled model were conducted to study the sensitivity of coupled systems to varying mean oceanic background conditions. It is shown that even modest changes in the background conditions can push the coupled system from one flow regime into another. ESA

ON THE SPACE-TIME STRUCTURE OF ENSO
Mojib Latif, Andreas Sterl, and Ernst Maier-Reimer Oct. 1991 28 p
(Grant EV4C-0035-D(B))
(MPIM-74; ETN-93-93669) Avail: CASI HC A03/MF A01

The space-time characteristics of the El Nino/Southern Oscillation (ENSO) phenomenon were investigated by analyzing observational data and data derived from an extended range integration performed with a coupled ocean-atmosphere general circulation model. A considerable portion of the ENSO related low frequency variability in both data sets is shown to be associated with a cycle that involves slow propagation in the equatorial heat content and the surface wind field. In contrast, sea surface temperature is dominated by a standing component. The existence of this cycle implies the possibility of ENSO predictions up to lead times of about one year. This is shown by conducting a large ensemble of predictions with a simple statistical prediction scheme. ESA

A COMPREHENSIVE GLOSSARY OF WEATHER TERMS FOR STORM SPOTTERS
Michael L. Branick (National Weather Service, Norman, OK.) Jan. 1993 30 p
(PB93-128940; NOAA-TM-NWS-SR-145) Avail: CASI HC A03/MF A01

The glossary contains weather-related terms that may be either heard or used by severe local storm spotters or spotter groups. Its purposes are (1) to achieve some level of standardization in the definitions of the terms that are used, and (2) provide a reference from which the meanings of any terms, especially the lesser-used ones, can be found. The idea is to allow smooth and effective communication between storm spotters and forecasters, and vice versa. A complete list of terms probably is impossible to arrive at, but this list is as comprehensive as possible. The definitions are written in what hopefully passes as 'layman's terms'. They are written to be easily understood by the storm spotter, regardless of his or her meteorological background. GRA

CLIMATOLOGICAL PROBABILITY OF CLOUD-FREE LINE-OF-SIGHT
Anthony J. Warren Dec. 1992 30 p
(AD-A260139; USAFETAC/TN-92-005) Avail: CASI HC A03/MF A01

This report describes how the climatological frequency distribution of cloud-cover is obtained and used to compute the climatological probability of cloud-free line-of-sight, or CFLOS. The probabilities can be estimated for an instantaneous point in time or for a specified time window (i.e., the probability of a continuous CFLOS for a time period of t minutes). The procedures outlined in the report are used by the USAF Environmental Technical Applications Center (USAFETAC) CPCFLOS computer program. An appendix describes the Burger Aerial Algorithm. GRA

TROPICAL CYCLONE FORECASTERS REFERENCE GUIDE 2: TROPICAL CLIMATOLOGY Final Report
R. A. Jeffries, J. H. Chu, R. J. Miller, and C. R. Sampson Apr. 1992 75 p
(AD-A259922; NOARL-236) Avail: CASI HC A04/MF A01

One of the keys to safe and successful naval operations in the tropics is a thorough understanding of tropical meteorology. The Tropical Cyclone Forecasters Reference Guide is designed primarily as a ready reference for mid-latitude forecasters required to provide tropical meteorology support to staff commanders. This technical note provides a comprehensive overview of tropical climatology and is chapter 2 of the reference guide. Subjects discussed include major factors which affect the tropical climate, tropical synoptic models, wave disturbances, tropical vortices, and tropical cyclones. GRA

USE OF SPECIAL SENSOR MICROWAVE/IMAGER (SSM/I) FOR ESTIMATION OF PRECIPITATION FEATURES IN A SEMI-ARID, MOUNTAIN REGION: A CASE STUDY OF SOUTHWEST SAUDI ARABIA Ph.D. Thesis
Abdul-Wahab Suliman Mashat 1992 129 p
Avail: Univ. Microfilms Order No. DA9300476

The linear regression method was used to determine the degree of correlation between soil caused by rainfall and Special Sensor Microwave/Imager (SSM/I) brightness temperatures or combinations of two brightness temperatures. This study is concerned with the application of passive microwaves to soil moisture classifications in a semi-arid, mountain region. The southwest region of Saudi Arabia was chosen for this study.

Two case studies were performed to investigate the response of SSM/I brightness temperatures to soil moisture. The first case study is at satellite ascending overpass time (about 6:00 a.m. local solar time), and the second case study is at satellite descending overpass time (about 6:00 p.m. local solar time). It is shown that brightness temperatures normalized with respect to ground temperature may be interpreted in terms of the soil moisture in the surface layer of the soil. Normalized brightness temperatures are not sensitive to soil moisture when precipitating clouds are present. The existence of precipitating clouds over the study area was determined through an examination of brightness temperatures at 8.5. GHz. It was found that the normalized brightness temperatures with respect to ground temperature responded to the change of the soil moisture caused by rainfall. The normalized brightness temperature in channel H19 with respect to ground temperature (H19/T) was the best single SSM/I channel to use for a surface soil moisture investigation at satellite descending overpass time, and the normalized brightness temperature in channel H37 with respect to ground temperature (H37/T) was the best single SSM/I channel to use for a surface soil moisture investigation at satellite ascending overpass time.

SCENARIO DEVELOPMENT FOR THE NORTHEAST UNITED STATES 500 MILLIBAR HEIGHT FIELD Ph.D. Thesis
Arthur Neil Samel 1992 160 p
Avail: Univ. Microfilms Order No. DA9235017

The spatial distribution of the 500 mb height fields associated with the occurrence of surface sulfur dioxide and ozone pollution episodes over the Northeast United States was identified. Several characteristic patterns were found. A modified Kirchhofer analysis was used to develop climatologies of the frequency of days having each of these characteristic patterns. The first climatology was developed for observational data. Similar climatologies were then developed for general circulation model atmospheres with carbon dioxide concentrations near the current value and after an effective doubling to produce a scenario of the future percentage of days similar to the characteristic patterns. A comparison between climatologies generated with observed data and model output from the atmosphere with current carbon dioxide levels revealed that the model produced a small percentage of days characterizing ozone episodes. This resulted from lower heights, caused by unrealistically low greenhouse gas concentrations in the model atmosphere. The model atmosphere reproduced the observed seasonality of days classified with the characteristic patterns. However, the disparity between climatologies generated with observed and model data precluded use of the observational information in an estimation of future conditions. Rather, the development of a scenario of future height fields had to be based on a comparison between the two model climatologies. This scenario indicates that neither the percentage of days similar to the sulfur dioxide characteristic patterns nor the seasonality of these days will change. The percentage of days similar to the ozone characteristic patterns will more than double, giving both more days during the summer, and an expansion of the period of occurrence into spring and autumn. While these results suggest little change in the number of sulfur dioxide pollution episodes and a large increase in the number of ozone event days, little confidence should be placed in them until model atmospheres using current carbon dioxide concentrations are able to reproduce the observed climatology of the characteristic patterns.

INTRASEASONAL RELATIONSHIPS BETWEEN TROPICAL HEATING AND EXTRATROPICAL JETS M.S. Thesis
Michael T. Neith 14 Dec. 1992 108 p
(AD-A260212) Avail: CASI HC A06/MF A02

Intraseasonal variations of the northern midlatitude circulation and their relationships with the global tropical heating field are investigated using climate model fields. The greatest intraseasonal variance in the midlatitude flow is found in the vicinity of the time mean jets, and in the areas immediately downstream of these jet exits. The model kinetic energy field associated with these jets shows a clear 30-60 day variation and eastward propagation within and between the different jet regions. This intraseasonal behavior is found to be well correlated with heating anomalies in specific parts of the global tropics. For each of the jet regions, a simple composite analysis is used to identify the global heating patterns associated with periods of strong and weak flow. For the North Pacific jet, strong flow occurs during and after periods of positive heating anomalies in the tropical western and central Pacific, and negative heating anomalies in the Indian Ocean. Conversely, the North Pacific flow is weak when these heating anomalies are reversed. The North Atlantic jet shows comparable relationships, with positive heating anomalies in the tropical western and eastern Pacific, and negative heating anomalies in the tropical Indian and Atlantic Oceans, before and during periods of strong flow. These intraseasonal teleconnections between individual jets and the global tropical heating field are especially clear for the North Pacific and North Atlantic jets. In addition to relatively direct forcing from nearby tropical heat sources, the jets may be influenced by relatively remote tropical heat sources, whose signals propagate through upstream jets.

PRELIMINARY RESULTS FROM THE ANALYSIS OF WIND COMPONENT ERROR, JULY DATA
Donald P. Gaver and Patricia A. Jacobs Nov. 1992 107 p
(AD-A259654; NPSOR-93-003) Avail: CASI HC A06/MF A02

Estimation of mean square prediction error of wind components is required in the optimal interpolation (OI) process in numerical prediction of atmospheric variables. Statistical models with log-linear scale parameters which include covariates are described for the prediction error. Data from February, April, and July of 1991 are used to fit the model parameters and to study the predictive ability of the models. This preliminary investigation indicates that observational and first guess wind components can be helpful in predicting mean square prediction error for wind components. The predictions using observational winds appear to be better at the 850 mb level. The predictions using first guess winds appear to be better at the 250 mb level.

AN INVESTIGATION OF THE ERICA IOP-5A CYCLONE M.S. Thesis
Julia M. Spinelli Dec. 1992 114 p
(AD-A260214) Avail: CASI HC A06/MF A02

A synoptic investigation was conducted of the rapid coastal cyclogenesis event that occurred during Intensive Observation Period (IOP) 5A of the Experiment on Rapidly Intensifying Cyclones over the Atlantic (ERICA). Navy Operational Regional Analysis and Prediction System (NORAPS)

objective analyses, utilizing operationally available and some special ERICA data, were examined in order to study the environment in which rapid development took place and to determine key synoptic and subsynoptic features important in the evolution of this storm. Additionally, the ability of NORAPS to accurately simulate the rapid cyclogenesis was investigated. Several processes contributed to the storm's intense development including strong low tropospheric temperature advection and upper-level cyclonic vorticity advection and divergence associated with a mobile trough and jet streak. NORAPS forecasts initialized 12 h prior to the explosive deepening phase of the IOP-5A cyclone provided a reasonably accurate simulation of the event. However, subjective hand analyses of hourly data for the period surrounding the onset of rapid deepening revealed the presence of a mesoscale coastal cyclone, which influenced the development of the storm. The development of this separate cyclone was not resolved by the model, resulting in a forecast track north of the actual storm's path. GRA

DYNAMIC AND THERMODYNAMIC CHARACTERISTICS OF A PRE-FRONTAL CONVECTIVE RAINBAND IN NORTHERN TAIWAN DETERMINED FORM TAMEX DATA Ph.D. Thesis
Hsiu-Wu Chang 1992 169 p
Avail: Univ. Microfilms Order No. DA9233787

In this study, structural features of a convective rainband associated with the Mei-Yu front on 25 June 1987 over northwestern Taiwan are investigated. dual-Doppler data were collected from the CP-4 and TOGA Doppler radars positioned along the northwest coast of Taiwan during the Taiwan Area Mesoscale Experiment (TAMEX). Fields of the system-relative wind and reflectivity were derived in a horizontal domain of 40 km by 36 km using an objective analysis scheme with 1 km grid spacing. Vertical velocities were computed from the anelastic continuity equation by integrating downward with variational adjustment. Results show that the low-level jet (LLJ) in the boundary layer provides large vertical shear ahead of the cold front. The depth of the cold air associated with the Mei-Yu front is rather shallow (1-2 km). To the south of the front, winds are from the southwest in the lower troposphere and veer with height in the middle and upper troposphere. The low-level convergence enhances lifting, resulting in a narrow band of convection on the warm side of the front. The rainband is composed of many cells which are accompanied by moderate convective updrafts (6-8 m s(exp -1) and weak downdrafts (2-4 m s(exp -1). Because the system traveled very slowly within the domain of interest, up to 200 mm of rainfall in 24 hours occurred on the west coast of Taiwan. The retrieved pressure and temperature fields are closely related to each other and are nearly in hydrostatic balance at most levels. The vertical component of horizontal momentum flux in a direction normal to the rainband is broadly countergradient, while the vertical momentum flux for the component parallel to the band is downgradient. The vertical transport of horizontal momentum during convection are largely responsible for the weakening of a LLJ and the growth of a MLJ as revealed by rawinsonde observations. Dissert. Abstr.

THE USE OF THE AIR FORCE CLOUD COVER DATA TO EVALUATE AND IMPROVE CLOUD FORECAST AND PARAMETERIZATION IN MESOSCALE METEOROLOGY MODELS Annual Report, 1 Oct. 1991 - 30 Sep. 1992
Chris J. Walcek 25 Nov. 1992 28 p
(Contract F49621-92-J-0018)
(AD-A260357; AFOSR-92-1006TR) Avail: CASI HC A03/MF A01

This research program utilizes satellite and surface-derived cloud observations together with standard meteorological measurements to evaluate and improve our ability to accurately diagnose cloud coverage. Results of the research will be used to complement existing or future parameterizations of cloud effects in global and regional-scale meteorology forecast models, since nearly all cloud parameterizations must specify a fractional area of cloud coverage when calculating radiative or dynamic cloud effects, and current parameterizations rely on rather crude cloud cover estimates. TURBULENT MICROFRONTS Final Report, 15 Jun. 1989 - 15 Oct. 1992
Larry Mahrt 5 Nov. 1992 9 p
(Contract DAAL03-89-K-0113)
(AD-A260300; ARO-26491.6-GS) Avail: CASI HC A02/MF A01

Turbulence structures in the atmospheric boundary layer were studied by focussing on microfronts. Microfronts are zones of sharp gradients which occur at the leading edge of wind gusts and upstream edges of thermals. Microfronts also result from convergence zones induced by horseshoe vortices and longitudinal roll vortices. The microfronts and their parent eddy structures account for the majority of the flux in the boundary layer, and in cases of strong winds, contribute to wind damage and structural fatique. However, existing methods, such as Fourier spectra, cannot be used to study microfronts which are local and aperiodic. In fact, microfronts and boundary layer eddies have been traditionally studied in terms of subjective conditional sampling. To avoid this subjectivity, objective techniques to study atmospheric turbulence from the microfront point of view were developed. These include new methods for computing spectra and filtering data. The techniques developed were then used to study coherent structures and their transport in the atmospheric boundary layer. GRA

METEOROLOGICAL DATA ASSIMILATION BY ADAPTIVE BAYESIAN OPTIMIZATION Ph.D. Thesis
Robert James Purser 1992 167 p
Avail: Univ. Microfilms Order No. DA9223895

The principal aim of this research is the elucidation of the Bayesian statistical principles that underlie the theory of objective meteorological analysis. In particular, emphasis is given to aspects of data assimilation that can benefit from an iterative numerical strategy. Two such aspects that are given special consideration are statistical validation of the covariance profiles and nonlinear initialization. A new economic algorithm is presented, based on the imposition of a sparse matrix structure for all covariances and precisions held during the computations. It is shown that very large datasets may be accommodated using this structure and a good linear approximation to the analysis equations established without the need to unnaturally fragment the problem. Since the integrity of the system of analysis equations is preserved, it is a relatively straight-forward matter to extend the basic analysis algorithm to one that incorporates a check on the plausibility of the statistical model assumed for background errors-the so-called 'validation' problem. Two methods of validation are described

within the sparse matrix framework: the first is essentially a direct extension of the Bayesian principles to embrace, not only the regular analysis variables, but also the parameters that determine the precise form of the covariance functions; the second technique is the non-Bayesian method of generalized cross validation adapted for use within the sparse matrix framework. The later part of this study is concerned with the establishment of a consistent dynamical balance within a forecast model - the initialization problem. The formal principles of the modern theory of initialization are reviewed and a critical examination is made of the concept of the 'slow manifold'. It is demonstrated, in accordance with more complete nonlinear models, that even within a simple three-mode linearized system, the notion that a universal slow manifold exists is untenable. It is therefore argued that a consistent treatment of the initialization problem should strictly be guided by statistics as much as by dynamics; a new methodology to accomplish the unification of analysis and initialization within the Bayesian paradigm is proposed.

(Contract F19628-89-C-0044)
(AD-A260036; AD-E201370; PL-TR-92-2229) Avail: CASI HC A05/MF A01

This report documents the development and testing of an advanced geophysical parameter retrieval, analysis and prediction system for global numerical weather prediction. the additions and improvements to the existing data assimilation system at the Phillips Laboratory are the following: a new surface pressure analysis, modifications for high resolution analysis, an optimal retrieval of SSM/T data based on Bayesian estimation, use of precipitation data to improve the moisture and divergence analysis and as input to a diabatic nonlinear normal mode initialization. The system uses a version of the advanced physics global spectral model of PL. The results of simulation tests show a significant improvement of the moisture analyses, especially in the tropics and Southern Hemisphere, and a smaller, but detectable improvement of the other variables, except in the stratosphere.

MODELING OF CLOUD/RADIATION PROCESSES FOR TROPICAL ANVILS Annual Report, 1 Nov. 1991 - 31 Oct. 1992
Q. Fu, K. N. Liou, and S. K. Krueger 30 Nov. 1992 108 p
(Grant AF-AFOSR-0039-91)
(AD-A260203; AFOSR-93-0025TR) Avail: CASI HC A06/MF A02

Satellite imagery suggests that large portions of the tropics are covered by extensive cirrus cloud systems. Tropical cirrus clouds evolve during the life cycle of the mesoscale convective systems and are modulated by large-scale disturbances. Outflow cirrus clouds from tropical cumulonimbi appear to be maintained in a convectively active state by radiative flux gradients within the clouds, as suggested by Danielson (1982). Extensive anvils are likely to become radiatively distabilized by cooling at tops and warming at bases. This would drive convective fluxes which in turn would provide an upward flux of water vapor within the cloud. The additional moisture at cloud top levels would promote rapid ice crystal growth and fallout. Ackerman et al. (1988) have computed radiative heating rates in typical tropical anvils. The heating rate differences between the cloud bottom and top ranges from 30 to 200 K/day. Lilly (1988) has analyzed the dynamic mechanism of the formation of cirrus anvils using a mixed layer model, and has shown that destabilization of the layer could be produced by strong radiative heating gradients. The importance of radiative processes in the life cycle of tropical anvils and convective systems has also been illustrated by Chen and Cotton (1988) and Dudhia (1989). GRA

SIZE DEPENDENCE OF THE CHEMICAL PROPERTIES OF CLOUD DROPLETS: EXPLORATORY STUDIES BY AIRCRAFT Ph.D. Thesis
Cynthia H. Twohy 1992 250 p Sponsored by National Science Foundation, Washington, DC Prepared in cooperation with Washington Univ., Seattle
(Grant NSF ATM-88-13825)
(PB93-136117; NCAR/CT-137) Avail: CASI HC A11/MF A03

Clouds play an important role in the climate of the earth and in the transport and transformation of chemical species, but many questions about clouds remain unanswered. The chemical properties of droplets may vary with droplet size, with potentially important consequences. The counterflow virtual impactor (CVI) separates droplets from interstitial particles and gases in a cloud and also can collect droplets in discrete size ranges. As such, the CVI is a useful tool for investigating the chemical components present in droplets of different sizes and their potential interactions with cloud processes. Although the impaction characteristics of the CVI seem to be predictable by theory, the airborne instrument is subject to influences that may result in a reduced transmission efficiency for droplets, particularly if the inlet is not properly aligned. Ways to alleviate the problem are being investigated, but currently the imperfect sampling efficiency must be taken into account during data interpretation.

ASSESSMENT OF SPACEBORNE LIDAR FOR METEOROLOGICAL ANALYSES Final Report, 12 Jul. 1989 - 12 Jul. 1992
R. G. Isaacs, M. Mickelson, G. Molnar, C. Grassotti, and T. Nehrkorn 13 Jul. 1992 54 p
(Contract F19628-89-C-0137)
(AD-A260026; AD-E201377; PL-TR-92-2205) Avail: CASI HC A04/MF A01

This report summarizes results of a basic research program to investigate and develop advanced techniques for obtaining and applying meteorological parameters from spaceborne lidars. The focus of this program was to identify potentially inexpensive lidar sensor concepts which provide maximum paybacks in improvements to numerical weather prediction (NWP) model performance. As the result of a trade-off of potential lidar systems for measuring meteorological parameters such as temperature, moisture, and winds, it was determined that maximum payback for NWP could be achieved by improving the accuracy and coverage of wind observations. Since they will be available from a polar orbiter, coverage will be increased, especially for extratropical areas. The lidar will produce winds wherever there is a cloud and will likely provide boundary layer winds from maritime aerosol backscatter. The assessment of the impact of candidate satellite lidar observation concepts on numerical weather analysis and prediction models was performed through a series of observing system simulation experiments (OSSE's). In addition to NWP model impacts, the fusion of potential lidar sensor system data with that from the current Defense Meteorological Satellite Program (DMSP) suite of passive sensors was considered. Special emphasis was placed on investigating active/passive data fusion approaches for improving the retrieval of atmospheric temperature and moisture profiles and the analysis of clouds (i.e., nephanalysis) in support of tactical and strategic operations.

CLIMATOLOGY OF STATION STORM RAINFALL IN THE CONTINENTAL UNITED STATES: PARAMETERS OF THE BARTLETT-LEWIS AND POISSON RECTANGULAR PULSES MODELS (Diskette Supplement)

Kelly Lynn Hawk and Peter S. Eagleson May 1992 331 p Diskette supplement: IBM compatible 5¼25-inch DSHD

(Contract NAS5-31721)

(NASA-CR-192968; NAS 1.26:192968; MIT-R92-19; MIT-336; NONP-Suppl-DK-93-159785) Avail: Issuing Activity (Center for AeroSpace Information) HC/DK A21

The parameters of two stochastic models of point rainfall, the Bartlett-Lewis model and the Poisson rectangular pulses model, are estimated for each month of the year from the historical records of hourly precipitation at more than seventy first-order stations in the continental United States. The parameters are presented both in tabular form and as isopleths on maps. The Poisson rectangular pulses parameters are useful in implementing models of the land surface water balance. The Bartlett-Lewis parameters are useful in disaggregating precipitation to a time period shorter than that of existing observations. Information is also included on a floppy disk. Author

ASPAM (ATMOSPHERIC SLANT PATH ANALYSIS MODEL) STATISTICAL PAIRED DIFFERENCES PILOT STUDY FOR SAMPLE SIZE DETERMINATION

Thomas H. Elio, Charles R. Coffin, and Lauraleen OConnor Nov. 1992 42 p

(AD-A260288; ATETAC-PR-92-005) Avail: CASI HC A03/MF A01

Methodology and results of a pilot study intended to determine the required PA sample size for a statistically significant seasonal study of the difference between ground truth (represented by upper-air soundings) and Atmospheric Slant Path Analysis Model (ASPAM) optimum interpolation vertical profiles (OIVP's) and alternate vertical profiles is described. This study builds on earlier studies, incorporating lessons learned and user feedback. It found that a sample size of 50 observations was enough to determine if the differences between ground truth (upper-air soundings) and ASPAM vertical profiles were significant at the customer's confidence level. SENSITIVITY OF MODELED CRETACEOUS CLIMATE TO INSOLATION FORCING CREATED BY VARYING EARTH-SUN ORBITAL RELATIONSHIPS Ph.D. Thesis

Thomas J. Glancy, Jr. 1992 754 p

Avail: Univ. Microfilms Order No. DA9239558

Rhythmic sedimentation patterns observed within the Cretaceous Western Interior Seaway, such as those in the Bridge Creek Limestone Member of the Greenhorn Limestone Formation exposed near Pueblo, Colorado, appear to be a response to episodic climate change. These climatic variations could, in turn, be forced by the periodic insolation change over the North American continent created by Milankovitch-scale Earth-Sun orbital relationships - eccentricity (100 kiloyears), obliquity (41 kiloyears) and precession of the equinox (23 kiloyears). To test the sensitivity of Cretaceous climate to changes in Milankovitch-scale insolation forcing, a set of seasonal simulations using maximum difference insolation forcing conditions was conducted with the National Center for Atmospheric Research's Community Climate Model using 100 MA Cretaceous paleogeography and paleotopography. Analysis showed statistically significant differences in surface temperature, precipitation, surface wind, storm track location, and upwelling occurred over many regions of the Cretaceous Earth, particularly in the summer and winter monsoon system. During Northern Hemisphere winter, differences in the position of storm passage over Cretaceous western North America under maximum difference insolation forcing conditions varies the precipitation received over the southern Western Interior Seaway at the location where the Bridge Creek Limestone Member rhythmic sedimentation was produced. Northern Hemisphere winter simulations removing all sea ice from the model showed little difference in the climatic effects observed over southwestern North America from the case with sea ice present. Additional simulations varying only the obliquity within the model suggest that the observed Bridge Creek Limestone Member rhythmic sedimentation patterns are controlled by climatic change produced by cyclic variation in the precession of the equinox and eccentricity insolation forcing, rather than by periodic change in obliquity insolation forcing. Northern Hemisphere summer and winter global displays are provided for the numerical mean values of surface temperature, precipitation, zonal and meridional component wind and wind vector and storm track distribution produced by the various combinations of insolation forcing used in the computer simulations. Dissert. Abstr.

EQUATORIAL ATMOSPHERIC WEATHER REGIMES: THEIR STRUCTURE AND ROLE Ph.D. Thesis

Vickie Sue Connors 1991 171 p

Avail: Univ. Microfilms Order No. DA9237617

Infrared radiance measurements by the Geostationary Operational Environmental Satellite (GOES-6) from April 1986 through April 1987 are used to characterize and identify distinct regimes of persistent, large-scale cloudiness patterns over the Amazon Basin. These tropical weather regimes are responsible for the continental-scale atmospheric processes that transport air, trace gases, and heat from the Amazon Basin. The cloud patterns are represented by both scene-scale parameters, such as the cloud-free area and the value of the 'clear sky peak' in a histogram, and textural measures, such as contrast of cloudy area and homogeneity or cloudy area. Correlation analyses of the attribute arrays determined that only 9 of the original 15 cloud pattern descriptors are required for the cluster analyses. Seventy-six percent of the satellite images are classified into 1 of 14 weather regimes which persist for periods that range from 3 to 15 days each. The dominant weather regimes are described by the recurrence and duration of the events, by the rainfall produced and energy released to the tropical atmosphere, and by the composite kinematic and thermodynamic analyses. While the classification analyses identified a range of organized weather conditions in the Amazon Basin, two weather regimes, each occurring in separate seasons, dominate the year. The prominent dry season regime (A) occurs 11 times, persists for 25 percent of the year, produces 81 percent of the dry season rainfall, and 7 percent of the energy export necessary to balance the global heat budget. The prominent wet season regime (B) occurs 8 times, persists for 18 percent of the year, delivers about 30 percent of the wet season rainfall, and 16 percent of the energy export requirement. Because the dry season regime (A) draws nearly half of its water vapor supply from local sources, a vital link may exist between the rainforest ecosystem and the dry season rainfall. Dissert. Abstr.

OBSERVED ANNUAL AND INTERANNUAL VARIATIONS IN TROPOSPHERIC WATER Technical Memo

Dian J. Gaffen Nov. 1992 172 p

(PB93-123313; NOAA-TM-ERL-ARL-198) Avail: CASI HC A08/MF A02

Radiosonde observations from a global network of 56 stations for 1973-1990 were used to describe and quantify annual and interannual variations of tropospheric water vapor. After data inhomogeneities related to changes in instruments or observing practices were identified, monthly mean and anomaly datasets were constructed for dew point, specific humidity, relative humidity, temperature, and precipitable water from the surface to 500 mb. An empirical orthogonal function analysis of tropical specific humidity variations identified two important modes of variability. The first is a steplike increase in specific humidity that occurred in about 1976-1977, and the second is associated with the El Nino phenomenon. The increase is consistent with the results of an extensive trends analysis of the data, which showed evidence for increases in precipitable water at about half of the 39 stations studied, decreases at three, and no statistically significant trend at the others. Precipitable water trends were closely related to trends in dew point and specific humidity, as one would expect, but they were not always related to temperature trends. GRA

A GAS EXTRACTION SYSTEM FOR THE MEASUREMENT OF CARBON DIOXIDE AND CARBON ISOTOPES IN POLAR ICE CORES Ph.D. Thesis
E. Steig Jun. 1992 36 p
(Contract DE-AC05-76OR-00033)
(DE93-005289; DOE/OR-00033/T508) Avail: CASI HC A03/MF A01

Knowledge of the distribution of carbon 13 in the glacial ocean, atmosphere, and biosphere is important to understanding the causes of glacial/interglacial changes in atmospheric CO2 levels. Although deep-ocean carbon 13 values are well-constrained by ocean sediment studies, model-based estimates of changes in the carbon budget for the biosphere and atmosphere vary considerably. Measurement of atmospheric carbon 13 in CO2 in ice cores will provide additional constraints on this budget and will also improve estimates of changes in the ocean surface layer carbon 13. Direct measurement of ancient atmospheric carbon 13 can be accomplished through polar ice core studies. A gas-extraction line for ice cores was designed and constructed with particular attention to the specific difficulties of measuring carbon 13 in CO2. The ice is shaved, rather than crushed, to minimize fractionation effects resulting from gas travel through long air-paths in the ice. To minimize the risk of isotopic contamination and fractionation within the vacuum line, CO2 is separated immediately from the air; the CO2 concentration is then measured by a simple pressure/volume comparison rather than by gas chromatography or spectroscopy. Measurements from Greenland ice core samples give an average value of 280 plus or minus 2 ppm CO2 for preindustrial samples, demonstrating that the extraction system gives accurate, precise determinations of CO2 concentrations. Measurement of carbon 13 from polar ice samples was not achieved at this time. However, results on standard air samples demonstrate a precision for carbon 13 of less than 0.2 (per thousand) at the 95 percent confidence level. DOE

MEASUREMENTS OF SURFACE OCEAN CARBON DIOXIDE PARTIAL PRESSURE DURING WOCE
1992 9 p
(Contract DE-FG03-90ER-60981)
(DE93-006890; DOE/ER-60981/T1) Avail: CASI HC A02/MF A01

This paper discusses the research progress of the second year of research under 'Measurement of Surface Ocean Carbon Dioxide Partial Pressure During WOCE' and proposes to continue measurements of underway pCO2. During most of the first year of this grant, our efforts to measure pCO2 on WOCE WHP legs were frustrated by ship problems. The R/V Knorr, which was originally scheduled to carry out the first work on WHP lines P19 and P16 in the southeastern Pacific during the 1990-91 austral summer, was delayed in the shipyard during her mid-life refit for more than a year. In the interim, the smaller R/V Thomas Washington, was pressed into service to carry out lower-latitude portions of WHP lines P16 and P17 during mid-1991 (TUNES Expedition). We installed and operated our underway chromatographic system on this expedition, even though space and manpower on this smaller vessel were limited and no one from our group would be aboard any of the 3 WHP expedition legs. The results for carbon dioxide and nitrous oxide are shown. A map of the cruise track is shown for each leg, marked with cumulative distance. Following each track is a figure showing the carbon dioxide and nitrous oxide results as a function of distance along this track. The results are plotted as dry-gas mole fractions (in ppm and ppb, respectively) in air and in gas equilibrated with surface seawater at a total pressure equal to the barometric pressure. The air data are plotted as a 10-point running mean, and appear as a roughly horizontal line. The seawater data are plotted as individual points, using a 5-point Gaussian smoother. Equal values of xCO2 in air and surface seawater indicate air-sea equilibrium. DOE

THE INFLUENCE OF WIND-DRIVEN OCEAN CIRCULATION ON EARTH ROTATION Ph.D. Thesis
Daniel Jonathan Steinberg 1992 121 p
Avail: Univ. Microfilms Order No. DA9300995

We have studied the role of barotropic, wind driven ocean circulation in exciting polar motion and the length of day at weekly to seasonal frequencies. The rotation of the earth is variable in length of day and in position of the rotation pole. The sources of these variations are not fully known. We have used the Cox and Bryan (1984) general circulation ocean model driven by daily NMC global winds to compute first the ocean currents and sea level variations, and then the rotational excitation functions, between 1980 and 1986. We find that the wind driven ocean circulation can explain much of the residual power in the length of day which is not accounted for by atmospheric angular momentum. It also appears that there is significant power, as much as 50 percent of that needed, in polar motion excitation at the Chandler and seasonal frequencies. Dissert. Abstr.

THE INFLUENCE OF THE HYDROLOGIC CYCLE ON THE EXTENT OF SEA ICE WITH CLIMATIC IMPLICATIONS Final Report
Kenneson G. Dean, William J. Stringer, and Craig Searcy Mar. 1993 66 p Original contains color illustrations
(Grant NAGw-1835)
(NASA-CR-192772; NAS 1.26:192772) Avail: CASI HC A04/MF A01; 6 functional color pages

Multi-temporal satellite images, field observations, and field measurements were used to investigate the mechanisms by which sea ice melts offshore from the Mackenzie River delta. Advanced Very High Resolution Radiometer (AVHRR) satellite data recorded in 1986 were analyzed. The satellite data were geometrically corrected and radiometrically calibrated so that albedo and temperature values could be extracted. The investigation revealed that sea ice melted approximately 2 weeks earlier offshore from the Mackenzie River delta than along coasts where river discharge is minimal or non-existent. There is significant intra-delta variability in the timing and patterns of ice melt. An estimation of energy flux indicates that 30 percent more of the visible wavelength energy and 25 percent more of the near-infrared wavelength energy is absorbed by water offshore of the delta compared to coastal areas with minimal river discharge. The analysis also revealed that the removal of sea ice involves the following: over-ice-flooding along the coast offshore from river delta channels; under-ice flow of 'warm' river water; melting and calving of the fast ice; and, the formation of a bight in the pack ice edge. Two stages in the melting of sea ice were identified: (1) an early stage where heat is supplied to overflows largely by solar radiation, and (2) a later stage where heat is supplied by river discharge in addition to solar radiation. A simple thermodynamic model of the thaw process in the fast ice zone was developed and parameterized based on events recorded by the satellite images. The model treats river discharge as the source of sensible heat at the base of the ice cover. The results of a series of sensitivity tests to assess the influence of river discharge on the near shore ice are presented.

TOPEX/POSEIDON JOINT VERIFICATION PLAN
15 Jun. 1992 101 p
(Contract NAS7-918)
(NASA-CR-192792; NAS 1.26:192792; JPL-Publ-92-9) Avail: CASI HC A06/MF A02

TOPEX/POSEIDON is a satellite mission that will use altimetry to make precise measurements of sea level with the primary goal of studying global ocean circulation. The mission is jointly conducted by the United States' National Aeronautics and Space Administration (NASA) and the French space agency, Centre National d'Etudes Spatiales (CNES). The current plans call for a launch of the satellite in August 1992. The primary mission will last 3 years, and provisions were made to extend the mission for an additional 2 years. The mission was coordinated with a number of international oceanographic and meteorological programs, including the World Ocean Circulation Experiment and the Tropical Ocean and Global Atmosphere Program, both of which are sponsored by the World Climate Research Program. The observations of TOPEX/POSEIDON are timed to provide a global perspective for interpreting the in situ measurements collected by these programs and in turn will be combined with observations of other satellites to achieve a global, four-dimensional description of the circulation of the world's oceans. In the autumn of 1987, an international team of 38 Principal Investigators was selected to participate in the mission. These scientists have been working closely with the TOPEX/POSEIDON Project to refine the mission design and science plans. During the first 6 months after launch, a number of these investigators will join with the project to conduct a wide range of oceanographic and geophysical investigations using the TOPEX/POSEIDON data. The purpose of these investigations is to demonstrate the scientific utility of the mission to the international scientific community. Author (revised)

TEMPORAL SAMPLING REQUIREMENTS FOR LOW FREQUENCY TEMPERATURE VARIABILITY IN THE EASTERN EQUATORIAL PACIFIC OCEAN
S. P. Hayes and M. J. McPhaden Nov. 1992 23 p
(PB93-136422; NOAA-TM-ERL-PMEL-96; CONTRIB-1404) Avail: CASI HC A03/MF A01

The effects of temporal subsampling of the near equatorial thermal field are examined using Monte-Carlo techniques. Approximately 3 years of continuous data from moored temperature sensors on the equator at 110 deg W and 140 deg W in the Pacific Ocean were randomly subsampled at frequencies of 1, 2, and 5 samples per month. Spectra of subsampled and original series demonstrate that the errors caused by subsampling are position, depth, and frequency dependent. In general, for a given number of samples errors are larger at the eastern location and in the thermocline. Adequate (spectral agreement to within a factor of two) resolution for periods longer than 3 months can be obtained at most depths with five samples per month. Fewer measurements are required near the surface.

THE ENVIRONMENTAL BIOGEOCHEMISTRY OF OPEN OCEAN AND PARTIALLY ENCLOSED MARINE SYSTEMS Ph.D. Thesis
Isabelle A. Dias 1990 244 p
Avail: Univ. Microfilms Order No. BRDX97368

The present study investigates the origin, distribution and fate of lipid biomarkers in the North Sea (particulates, sediments, zooplankton faecal pellets) and the Atlantic Ocean (surface water particulates), as representatives of partially enclosed and open marine systems. An extension and expansion (with the aid of GC and GC-MS) of the laboratory culture experiments performed by other workers was contemplated. A simultaneous study of chlorophyll and carotenoid pigments was executed in the Atlantic Ocean to determine (by HPLC) latitudinal variations in phytoplanktonic and detrital abundance, and the physiological status of the samples. Phytoplankton speciation and distribution was determined by microscopy at Plymouth Marine Laboratory, in an attempt to attribute biomarkers to putative marine sources. Potential correlations existing within the accumulated results were examined as a prelude to a more detailed inspection using a modified statistical software package (Principal Components Analysis - PCA) capable

of dealing with very large data sets with relative ease. Investigations of particulates (by microscopy) in the Atlantic Ocean, defined areas of high and low phytoplankton productivity along with associated zooplankton grazing activity. High productivity areas were dominated by diatoms, coccolithophores and dinoflagellates, whereas oligotrophic regions were populated mainly by cyanobacterial species. Applied PCA of the North Sea samples was useful for distinguishing individuals of varied origin into distinct groups on the basis of fatty acid and sterol content. Clusters emerged from amongst the different sample types, despite the range of species (particulates and zooplankton faecal pellets) and grain sizes (sediments) present. Similar treatment of the Atlantic pigment data enabled specific chlorophylls and carotenoids to be related to phytoplanktonic spatial abundances, and to productive oligotrophic regions. In addition, statistical analyses of the Atlantic sterol data differentiated high productivity, temperate waters containing diatoms, dinoflagellates and coccolithophores, from those of the oligotrophic South Atlantic, containing rod bacteria and cyanobacteria. Combined PCA of the entire fatty acid data set (94 samples and 73 acids) discriminated the open and enclosed marine systems. However, such examinations of the Atlantic FAME's data and the combined analysis of the complete sterol data (94 samples) were unsuccessful. This was due to the ubiquitous origins of the lipids under scrutiny. In conclusion, PCA was found to be an effective and efficient tool in the analyses of these data matrices. Author

ANNUAL AND LONGITUDINAL VARIATIONS OF THE PACIFIC NORTH EQUATORIAL COUNTERCURRENT
Nina K. Lolk (California Univ., Los Angeles.) Mar. 1992 221 p
(Contract NAS7-918)
(NASA-CR-192805; NAS 1.26:192805; JPL-Publ-92-8) Avail: CASI HC A10/MF A03

The climatological annual cycle of the Pacific North Equatorial Countercurrent (NECC) simulated by an ocean general circulation model (OGCM) was studied. The longitudinal variation of transports, degree of geostrophy, and the relationship between Ekman pumping and vertical displacement of the thermocline were emphasized. The longitudinal variation was explored using six sections along 150 deg E, 180 deg, 160 deg W, 140 deg W, 125 deg W, and 110 deg W. A primitive equation OGCM of the Pacific Ocean was run for three years and the fields used were from the third year. The fields consisted of zonal, meridional, and vertical current components and temperature and salinity averaged every three days. The model was forced with the Hellerman and Rosenstein climatological wind stress. The mean annual eastward transport (19.9 Sv) was largest at 160 deg W. The maximum-current boundaries along 160 deg W were 9.2 deg N (1.0 deg), 5.1 deg N (1.1 deg), and 187 m (90.6 m). The annual-cycle amplitude of the NECC was greatest between 160 deg W and 140 deg W. Although the NECC is geostrophic to the first order, deviations from geostrophy were found in the boreal spring and summer near the southern boundary and near the surface. Meridional local acceleration played a role between 3 deg N-5 deg N. Author (revised)

DIRECT NUMERICAL SIMULATIONS AND HYDRODYNAMIC STABILITY PROBLEMS IN THE UPPER OCEANIC MIXED LAYER Ph.D. Thesis
Amit Tandon 1992 142 p
Avail: Univ. Microfilms Order No. DA9300828

Langmuir circulations are longitudinal rolls driven by the wind and appear beneath the surface of the ocean. Following Craik and Leibovich, we model these as an instability of the mean current due to its interaction with averaged effect of the surface waves. Simulations and nonlinear dynamical analyses have previously been carried out with these rolls assumed to be independent of the downwind direction. We allow for perturbations in three dimensions for a layer of finite depth. Linear stability analysis shows that two-dimensional rolls are most unstable for unstratified flow as in previous two-dimensional studies. In presence of stratification three-dimensional modes are most unstable. At low and high values of the Reynolds number, the most unstable modes are nearly two-dimensional. At intermediate values, three dimensionality is important. The angular deviation from the wind direction of the most unstable modes increases with stratification, in the range considered. Two-dimensional simulations are done at different values of stratification for unconstrained and constrained sidewall boundary conditions. These show good agreement qualitatively and quantitatively with the weakly nonlinear dynamics of the governing equations in two-dimensions. We perform a secondary stability (Floquet) analysis to determine the range of stability of unstratified steady Langmuir rolls and elicit the streamwise length scales when rolls become unstable. Eckhaus and Oscillatory mechanisms of instability are found to be important at a moderate value of Reynolds number. Subsequent direct numerical simulations are performed for corresponding instabilities. Oscillatory instability sets in as streamwise traveling waves. As one of the destabilizing parameters is increased, quasi-periodic motion is observed, with a low frequency vacillating mode. At lower values of Reynolds number, the secondary instability thresholds for the forcing are higher and steady rolls are stable in a larger domain of parameter space. Simulations at high forcing at low Reynolds number show defect traveling wave solutions. The bifurcation to these solutions may be subcritical. Vacillating modes and defect solutions may be responsible for slow realignment of the windrows with time.

A DIRECT MATHEMATICAL APPROACH TO OPTIMIZE THE AGE-DEPTH RELATION OF DEEP-SEA SEDIMENT CORES
Wolfgang Brueggemann Jan. 1992 43 p
(MPIM-77; ETN-93-93671) Avail: CASI HC A03/MF A01

A direct mathematical approach is used to find simultaneously an optimal age depth relation and a linear model that optimally links solar insolation or other model input with global ice volume. Thus, a general tool for the calibration of deep sea cores to arbitrary tuning targets is presented. In this inverse modeling type approach, an objective function is minimized that penalizes: the deviation of the data from the theoretical linear model (whose transfer function can be computed analytically for a given age depth relation), and the violation of a set of plausible assumptions about the model, the data and the obtained correction of a first guess age depth function. An unconstrained optimization problem is formulated that is solved numerically by conjugate gradient type methods. Using this direct approach, high coherencies are obtained in the Milankovitch frequency bands (over 90 percent). Not only the data time series, but also the derived correction to a first guess linear age depth function (and therefore the sedimentation rate) itself contains significant energy in a broad frequency band around 100 ky. The use of a sedimentation rate which varies continuously on ice age time scales results in a shift of energy from 100 ky in the original data spectrum to 41, 23 and 19 ky in the spectrum of the corrected data. However, a large proportion of the data variance remains unexplained, particularly in the 100 ky frequency band, where there is no significant input by orbital forcing. The method is applied to a real sediment core and to the SPECMAP stack, and results are compared with those obtained in earlier investigations. ESA

EVALUATION OF THE BATHYSCAN SWEEP SURVEY SYSTEM Technical Report, Sep. - Oct. 1990
Anthony Niles May 1992 34 p
(AD-A260162; TEC-0008) Avail: CASI HC A03/MF A01

The U.S. Army Corps of Engineers has an interest in hydrographic survey sweep systems, which produce depth soundings over the total bottom area. Such systems can have significant advantages, such as shorter survey times and more complete bottom representations, over the single-trace systems commonly used in the corps. Such a sweep system, the Bathyscan Hydrographic Survey System that uses interferometric side-scan sonar, was demonstrated to the corps. The Bathyscan proved to be a well-engineered and innovative design that would be well suited to corps reconnaissance surveys. Although the system was not survey ready due to some minor software problems and an error in an input parameter, the Bathyscan may be well-suited to condition and contract-payment surveys performed by the Corps. ORBITAL TUNING OF MARINE SEDIMENTARY CORES: AN AUTOMATIC PROCEDURE BASED ON A GENERAL LINEAR MODEL
Bjoern Grieger Jan. 1992 34 p
(MPIM-79; ETN-93-93673) Avail: CASI HC A03/MF A01

A method to optimize the chronology of marine cores by orbital tuning is presented. In a first step, and as an additional result, a model for the variation of the oxygen isotope abundance ratio throughout the core is calculated. The model consists of two components: one results from the convolution of the solar insolation at 65 deg on 15 Jul. with an impulse response function which is calculated from the data, the other is an additional low frequency component. The initial age depth relation of the core can be optimized by minimizing the deviation between model and data. The results of applications in the Meteor core 13519 and the Ocean Drilling Program core site 658 are shown. With the optimized chronologies the model fits the data quite well throughout the investigated cores. ESA

IRON FERTILIZATION OF THE AUSTRAL OCEAN: A MODEL ASSESSMENT
Katharina D. Kurz and Ernst Maier-Reimer May 1992 20 p
(MPIM-84; ETN-93-93678) Avail: CASI HC A03/MF A01

A proposal that an artificial iron fertilization could increase the productivity of the Antarctic Ocean and therefore reduce substantially the atmospheric carbon dioxide level is addressed. A set of experiments was performed with the three dimensional Hamburg global carbon cycle model to study the impact of such a fertilization. Under the assumption that only the magnitude but not the basic structure of the particulate downward flux is changed by the fertilization, the structure of the oceanic circulation is concluded to be able to support a higher remineralization as well as higher primary production. The reduction of the atmospheric content of carbon dioxide by the fertilization does not exceed 60 ppm. ESA

AIRBORNE STUDIES OF OCEAN-PARTICLE-CLOUD INTERACTIONS
4 Jan. 1993 6 p
(AD-A259874) Avail: CASI HC A02/MF A01

The objectives were to measure the lead signatures by remote sensing, measure emissions and fluxes from leads, determine effects of lead emissions of clouds, and to characterize arctic haze. Our approach was to fly over the pack ice, north of Deadhorse Alaska, detect leads with open water and conduct in situ measurements, sampling and remote sensing measurements. The measurements included determining the concentrations of droplets, ice crystals, and cloud condensation nuclei near leads. GRA

STUDIES OF MIXING AND INTERNAL WAVES IN THE UPPER OCEAN Ph.D. Thesis
Hemantha W. Wijesekera 1992 171 p
Avail: Univ. Microfilms Order No. DA9238070

Microstructure measurements in the equatorial Pacific at 140 deg W in late 1984 show a pronounced diurnal variation in both high-frequency internal wave energy and kinetic energy dissipation rate. Observations indicated that after sunset, internal waves propagate downward and increase turbulence levels in the pycnocline. A wave dissipation model based on the observed turbulent kinetic energy dissipation rate predicts that most of the downward wave momentum flux penetrates through the undercurrent core. It is hypothesized that when the wind stress is strong, the equatorial Pacific ocean responds by generating a westward travelling internal wave field which transports much of the surface wind stress below the actively mixing surface layer. Several models now exist for predicting the dissipation rate of turbulent kinetic energy, e, in the oceanic thermocline as a function of the large-scale properties of the internal gravity wave field. These models are based on the transfer of energy towards smaller vertical scales by wave-wave interactions, and their predictions are typically evaluated for a canonical internal wave field as described by Garrett and Munk. Here we use simultaneous measurements of the the internal wave field and e from a drifting ice camp in the eastern Arctic Ocean to evaluate the efficacy of existing models in a region with an anomalous wave field and energetic mixing. We find that, by explicitly retaining the vertical wavenumber bandwidth parameter, B*, models can still provide reasonable estimates of the dissipation rate. Statistics of turbulent patches are used to describe the nature of mixing in the pycnocline near abrupt bottom topography. It is found that the turbulent kinetic energy dissipation rate, e(sub r), averaged over a region of height r has a lognormal distribution consistent with Kolomorov's third hypothesis: sigma-squared(sub ln(e sub r)) = A + mu ln(L sub p / r) where sigma-squared(sub ln)(e sub r) is the variance of ln(e sub r), r satisfies L sub p greater than r greater than nu (L sub p is the size of the mixing patch, nu is the Kolmogorov scale, A depends on the large-scale flow field, and mu is a universal constant). The majority of the observed turbulent patches may be explained with the conventional ideas of shear-driven turbulence. However, some events with large overturning structures are substantially different from the predictions of shear-driven turbulence, suggesting that there is at least one source of turbulent kinetic energy other than shear production. Based on inertial-subrange energy arguments, it is proposed that the overturning seen in these events is a release of potential energy to kinetic energy, such as might be expected from advective instability in a finite-amplitude internals wave field. AN AUTONOMOUS EXPENDABLE CONDUCTIVITY, TEMPERATURE, DEPTH PROFILER FOR OCEAN DATA COLLECTION
J. Downing (Battelle Pacific Northwest Labs., Sequim, WA.), B. G. DeRoos (Battelle Memorial Inst., Columbus, OH.), and K. McCoy (Ocean Sensors, Inc., San Diego, CA.) Oct. 1992 7 p Presented at the Oceans 1992, Newport, RI, 26-29 Oct. 1992
(Contract DE-AC06-76RL-01830)
(DE93-005038; PNL-SA-21225; CONF-921066-2) Avail: CASI HC A02/MF A01

An Autonomous Expendable Conductivity - Temperature - Depth Profiler (AXCTD) for profiling temperature, conductivity, pressure, and other parameters in remote oceanic regions is described. The AXCTD is a microcomputer-controlled sensor package that can be deployed by unskilled operators from ships or aircraft. It records two CTD profiles (one during descent and another during ascent) and CTD times series while on the bottom and adrift at the surface. Recorded data are transmitted to an ARGOS satellite with ground-positioning capabilities. The AXCTD can provide 'sea truth' for remote sensing, perform environmental and military surveillance missions, and acquire time-series and synoptic data for computer models. DOE

ACTIVE AND PASSIVE REMOTE SENSING OF ICE Final Report, 1 Oct. 1988 - 30 Nov. 1992
J. A. Kong 26 Jan. 1993 73 p
(Contract N00014-89-J-1107)
(AD-A259765) Avail: CASI HC A04/MF A01

The theoretical approach that has been developed to interpret the polarimetric active measurements of saline ice is a random medium model using the radiative transfer theory. The ice layer is described as a host ice medium embedded with randomly distributed inhomogeneities, and the underlying sea water is considered to be a homogeneous halfspace. Multiple scattering effects are accounted for by solving the radiative transfer equations numerically. The effects of random roughness at the air - ice, and ice -

water interfaces are accounted for by modifying the boundary conditions in the radiative transfer equations. Analysis of the model for reconstruction of sea ice parameters is made. An optimization approach is used for inversion. The discrepancy between the data and the results of the forward model is minimized by changing the inversion parameters according to a nonlinear programming scheme. Reconstruction of correlation lengths in the horizontal and vertical dimensions was accomplished using the polarimetric backscattering coefficients at different angles of incidence as input data. Effects of data diversity and noise on the reconstruction of the physical parameters of sea ice from the backscattering coefficients are being investigated. GRA

ON THE PHYSICAL BOUNDARY CONDITIONS IN THE OCEAN/BOTTOM ACOUSTIC INTERACTION MODEL
Ivar Lie 23 Jul. 1992 21 p
(FFI-92/7023; ETN-93-93571) Avail: CASI HC A03/MF A01

An extension to a model for acoustic bottom interaction problems is reported. This model uses interface conditions between the different media based on continuous normal velocity and continuous normal stress. The model was extended to include continuity in tangential velocity and damping at the interface. Numerical experiments show that these extended models are time stable. The use of the equations of viscoelasticity in the bottom medium and application of the equations of a fluid saturated porous medium are discussed. ESA

MODELING THE TROPICAL OCEAN RESPONSE TO WESTERLY WIND FORCING M.S. Thesis
Claudia S. Whitney Dec. 1992 133 p
(AD-A260230) Avail: CASI HC A07/MF A02

A primitive equation ocean general circulation model, with mixed layer physics, was developed and applied to an investigation of the equatorial ocean. The major physical problem addressed with this model is the response of the upper ocean to westerly wind events, such as those that occur during tropical cyclones and during El Nino events. In the model development phase, several configurations of the mixed layer physics, domain size, and wind stress were tested. The best overall simulations were produced when both Richardson number-dependent mixing and a bulk mixed layer model were included. Small model domains were found to be especially sensitive to the prescribed lateral boundary conditions and wind stress. Smaller domains required more realistic wind stress fields in order to achieve reasonable current structures. In addition, the off-equatorial currents were particularly responsive to changes in the zonal gradient of the wind stress. The final configuration of the model produces realistic simulations of climatological three-dimensional temperature and current structures in the equatorial ocean. In the model application phase, synoptically varying winds for the tropical Pacific were used to force the model. The winds came from the Navy's Operational Global Atmospheric Prediction System's (NOGAPS) daily analyses for the 1991-92 El Nino, which included several strong westerly wind events. The strong temporal and spatial variability in these winds produced complex fluctuations of the model's temperatures, currents, and internal waves, including reversals of the South Equatorial Current and equatorially trapped Kelvin waves. NUMERICAL SIMULATION AND PREDICTION OF COASTAL OCEAN CIRCULATION Ph.D. Thesis
Ping Chen 1992 249 p
Avail: Univ. Microfilms Order No. DA9227872

Numerical simulation and prediction of coastal ocean circulation have been conducted in three cases. (1) A process-oriented modeling study is conducted to study the interaction of a western boundary current (WBC) with coastal water, and its responses to upstream topographic irregularities. We hypothesize that the interaction of propagating WBC frontal waves and topographic Rossby waves are responsible for upstream variability. The model contains a spun-up WBC, a continental slope/shelf and topographic irregularity (island blocking and seamounts of various sizes). It is found that these topographic irregularities are origins of topographic waves which propagate southward, and that flow variabilities, including large amplitude meanders and shelfward intrusions, occur at upstream distances which coincide approximately with topographic standing wavelength due to the superposition of frontal waves and topographic waves. (2) A simulation of meanders and eddies in the Norwegian Coastal Current (NCC) for February and March of 1988 is conducted with a newly developed nested dynamic interactive model. The model employs a coarse-grid, large domain to account for non-local forcing and a fine-grid nested domain to resolve meanders and eddies. The model is forced by wind stresses, heat fluxes and atmospheric pressure corresponding Feb/Mar of 1988, and accounts for river/fjord discharges, open ocean inflow and outflow, and M2 tides. The simulation reproduced fairly well the observed circulation, tides, and salinity features in the North Sea, Norwegian Trench and NCC region in the large domain, and fairly realistic meanders and eddies in the NCC in the nested region. (3) A methodology for practical coastal ocean hindcast/forecast is developed, taking advantage of the disparate time scales of various forcing and considering wind to be the dominant factor in affecting density fluctuation in the time scale of 1 to 10 days. The density field obtained from a prognostic simulation is analyzed by the empirical orthogonal function method (EOF), and correlated with the wind; these information are then used to drive a circulation model which excludes the density calculation. The method is applied to hindcast the circulation in the New York Bight for spring and summer season of 1988. The hindcast fields compare favorably with the results obtained from the prognostic circulation model. Dissert. Abstr.

APPLICATION OF OCEAN MODELS FOR THE INTERPRETATION OF AGCM EXPERIMENTS ON THE CLIMATE OF THE LAST GLACIAL MAXIMUM
Michael Lautenschlager (Deutsches Klimarechenzentrum G.m.b.H., Hamburg, Germany.), Uwe Mikolajewicz, Ernst Maier-Reimer, and Christophe Heinze (Hamburg Univ., Germany.) 23 Mar. 1992 23 p Sponsored by BMFT
(MPIM-80; ETN-93-93674) Avail: CASI HC A03/MF A01

The response of ocean models of physical circulation and geochemical tracer distributions to atmospheric glacial forcing is examined. The CLIMAP Sea Surface Temperature (SST) was taken directly as a boundary condition. The windstress and freshwater flux were derived from the ice age response of an Atmospheric General Circulation Model (AGCM). Near the surface, the ocean response in temperature and circulation reflects primarily the imposed glacial forcing fields. The simulated deep ocean response, especially in the North Pacific, is in conflict with the observational evidence. The changes in the physical circulation appear to be qualitatively derived from sediment cores, but, probably, highly overestimated. The misfit between model and data was established more clearly in the distribution of (delta)C-13, where a direct comparison with sediment core data is possible. The simulated AGCM freshwater flux, which is linked for example by the evaporation to the imposed SST field, is suspected to be the most probable reason for this conflict. ESA

The long-range goal of this research was to refine our understanding of the sensitivity of the vestibular components of the ear to very-low-amplitude motion, especially, the role of gravity in this sensitivity. We focused on the American bullfrog--a common animal subject for vestibular sensory research. Our principal experimental method was to apply precise, sinusoidal microrotational stimuli to an anesthetized animal subject, to record the resulting responses in an individual vestibular nerve fiber from the intact ear, and to use intracellular dye to trace the fiber and thus identify the vestibular sensor that gave rise to it. In this way, we were able to identify specific micromotional sensitivities and to associate those sensitivities definitely with specific sensors. Furthermore, by recording from nerve fibers after they leave the intact inner-ear cavity, we were able to achieve these identifications without interrupting the delicate micromechanics of the inner ear. We were especially concerned with the relative roles of the utricle and the anterior semicircular canal in the sensing of microrotational motion of the head about horizontal axes, and with the role of gravity in mediating that sensing process in the utricle. The functional characterization of individual nerve fibers was accomplished with a conventional analytical tool, the cycle histogram, in which the nerve impulse rate was plotted against the phase of the sinusoidal stimulus. EFFECTS OF 60-Hz ELECTRIC AND MAGNETIC FIELDS ON OPERANT AND SOCIAL BEHAVIOR AND ON NEUROENDOCTRINE SYSTEM OF NONHUMAN PRIMATES
W. R. Rogers 22 Jan. 1993 11 p
(Contract DE-AC02-80RA-50219)
(DE93-007677; DOE/RA-50219/T27) Avail: CASI HC A03/MF A01

This series of experiments, using a well-characterized exposure facility and employing a variety of control procedures to study behavior and the neuroendoctrine system of nonhuman primates, does not provide any evidence that exposure to power-frequency electric fields, or electric and magnetic fields in combination, for 12 hours per day for six weeks produces any deleterious effects in young-adult males. The primate experiments summarized here confirm the general conclusion indicated by experiments with rodents; although biological and behavioral changes can occur, there are no clear results establishing the occurrence of adverse effects in experiments involving relatively short-term exposure to environmentally-relevant electric or magnetic fields. Given the general agreement of the primate and rodent results, conclusions from the laboratory animal studies therefore presumably generalize well to humans. DOE

The JSC Life Sciences Project Division has been directly supporting NASA Headquarters, Life Sciences Division, in the preparation of data from JSC and ARC to assist in defining the Space Biology Initiative (SBI). GE Government Services and Horizon Aerospace have provided contract support for the development and integration of review data, reports, presentations, and detailed supporting data. An SBI Definition (Non-Advocate) Review at NASA Headquarters, Code B, has been scheduled for the June-July 1989 time period. In a previous NASA Headquarters review, NASA determined that additional supporting data would be beneficial to determine the potential advantages in modifying commercial off-the-shelf (COTS) hardware for some SBI hardware items. In order to meet the demands of program implementation planning with the definition review in late spring of 1989, the definition trade study analysis must be adjusted in scope and schedule to be complete for the SBI Definition (Non-Advocate) Review. The relative costs of modifying existing commercial off-the-shelf (COTS) hardware is compared to fabricating new hardware. An historical basis for new build versus modifying COTS to meet current NMI specifications for manned space flight hardware is surveyed and identified. Selected SBI hardware are identified as potential candidates for off-the-shelf modification and statistical estimates on the relative cost of modifying COTS versus new build are provided. Avail: CASI HC A05/MF A04

A significant emphasis upon automation within the Space Biology Initiative hardware appears justified in order to conserve crew labor and crew training effort. Two generic forms of automation were identified: automation of data and information handling and decision making, and the automation of material handling, transfer, and processing. The use of automatic data acquisition, expert systems, robots, and machine vision will increase the volume of experiments and quality of results. The automation described may also influence efforts to miniaturize and modularize the large array of SBI hardware identified to date. The cost and benefit model developed appears to be a useful guideline for SBI equipment specifiers and designers. Additional refinements would enhance the validity of the model. Two NASA automation pilot programs, 'The Principal Investigator in a Box' and 'Rack Mounted Robots' were investigated and found to be quite appropriate for adaptation to the SBI program. There are other in-house NASA efforts that provide technology that may be appropriate for the SBI program. Important data is believed to exist in advanced medical labs throughout the U.S., Japan, and Europe. The information and data processing in medical analysis equipment is highly automated and future trends reveal continued progress in this area. However, automation of material handling and processing has progressed in a limited manner because the medical labs are not affected by the power and space constraints that Space Station medical equipment is faced with. Therefore, NASA's major emphasis in automation will require a lead effort in the automation of material handling to achieve optimal crew utilization. Author (revised)

The optimum hardware miniaturization level with the lowest cost impact for space biology hardware was determined. Space biology hardware and/or components/subassemblies/assemblies which are the most likely candidates for application of miniaturization are to be defined and relative cost impacts of such miniaturization are to be analyzed. A mathematical or statistical analysis method with the capability to support development of parametric cost analysis impacts for levels of production design miniaturization are provided. The differences in rack requirements for Spacelab, the Shuttle Orbiter, and the United States (U.S.) laboratory module, European Space Agency (ESA) Columbus module, and the Japanese Experiment Module (JEM) of Space Station Freedom are identified. The feasibility of designing standardized mechanical, structural, electrical, data, video, thermal, and fluid interfaces to allow space flight hardware designed for use in the U.S. laboratory module to be used in other locations is assessed.

SPACE BIOLOGY INITIATIVE PROGRAM DEFINITION REVIEW. TRADE STUDY 2: PROTOTYPE UTILIZATION IN THE DEVELOPMENT OF SPACE BIOLOGY HARDWARE Final Report
L. Neal Jackson, John Crenshaw, Sr., Arthur E. Schulze (Lovelace Scientific Resources, Inc., Albuquerque, NM.), and H. J. Wood, Jr. (Lovelace Scientific Resources, Inc., Albuquerque, NM.) *In its* Space Biology Initiative. Trade Studies, Volume 2 1 Jun. 1989 101 p Prepared in cooperation with Lovelace Scientific Resources, Inc., Albuquerque, NM (For primary document see N93-23079 08-51)
(Contract G966016-J45)
Avail: CASI HC A06/MF A03

The objective was to define the factors which space flight hardware developers and planners should consider when determining: (1) the number of hardware units required to support program; (2) design level of the units; and (3) most efficient means of utilization of the units. The analysis considered technology risk, maintainability, reliability, and safety design requirements for achieving the delivery of highest quality flight hardware. Relative cost impacts of the utilization of prototyping were identified. The development of Space Biology Initiative research hardware will involve intertwined hardware/software activities. Experience has shown that software development can be an expensive portion of a system design program. While software prototyping could imply the development of a significantly different end item, an operational system prototype must be considered to be a combination of software and hardware. Hundreds of factors were identified that could be considered in determining the quantity and types of prototypes that should be constructed. In developing the decision models, these factors were combined and reduced by approximately ten-to-one in

order to develop a manageable structure based on the major determining factors. The Baseline SBI hardware list of Appendix D was examined and reviewed in detail; however, from the facts available it was impossible to identify the exact types and quantities of prototypes required for each of these items. Although the factors that must be considered could be enumerated for each of these pieces of equipment, the exact status and state of development of the equipment is variable and uncertain at this time. A PROPOSAL TO DEMONSTRATE PRODUCTION OF SALAD CROPS IN THE SPACE STATION MOCKUP FACILITY WITH PARTICULAR ATTENTION TO SPACE, ENERGY, AND LABOR CONSTRAINTS Final Report, 1 Jul. - 31 Dec. 1992

Carolyn A. Brooks 31 Dec. 1992 36 p

(Contract NCC2-607)

(NASA-CR-192815; NAS 1.26:192815) Avail: CASI HC A03/MF A01

The Salad Machine Research has continued to be a two path effort with the research at Marshall Space Flight Center (MSFC) focusing on the design, construction, and operation of a semiautomated system (Salad Machine) for the production of salad vegetables within a standard rack. Boeing Corporation in cooperation with NASA MSFC constructed a four drawer Salad Machine which was occasionally placed within the Space Station Freedom Mockup facility for view by selected visitors. Final outfitting of the Salad Machine is awaiting the arrival of parts for the nutrient delivery system. Research at the Alabama A&M facilities focused on compatibility of radish and lettuce plants when grown on the same nutrient solution. Lettuce fresh weight shoot yield was significantly enhanced when lettuce plants were grown on nutrient solution which was shared with radish. Radish tuber production was not significantly affected although there was a trend for radish from shared solutions to be heavier than those grown on separate nutrient solutions. The effect of sharing nutrient solutions on carbohydrate partitioning reflected the effect of sharing solution on fresh weight yield. Lettuce shoot dry weight was significantly greater for plants from shared solutions than from separate. There was no significant effect on sharing nutrient solution on radish tuber dry weight. Partitioning of nitrogen, calcium, magnesium, and potassium was not affected by sharing, there was, however, a disproportionate amount of potassium in the tissues, suggesting luxury consumption of potassium in all plants and tissues. It is concluded that lettuce plants benefit from sharing nutrient solution with radish and that radish is not harmed. Author (revised)

NEURAL PROCESSING OF GRAVITY INFORMATION Final Technical Report, 1 Nov. 1987 - 30 Jun. 1992

Robert H. Schor 30 Jun. 1992 3 p

(Contract NCC2-495)

(NASA-CR-192766; NAS 1.26:192766) Avail: CASI HC A01/MF A01

The goal of this project was to use the linear acceleration capabilities of the NASA Vestibular Research Facility (VRF) at Ames Research Center to directly examine encoding of linear accelerations in the vestibular system of the cat. Most previous studies, including my own, have utilized tilt stimuli, which at very low frequencies (e.g., 'static tilt') can be considered a reasonably pure linear acceleration (e.g., 'down'); however, higher frequencies of tilt, necessary for understanding the dynamic processing of linear acceleration information, necessarily involves rotations which can stimulate the semicircular canals. The VRF, particularly the Long Linear Sled, has promise to provide controlled pure linear accelerations at a variety of stimulus frequencies, with no confounding angular motion. Author (revised)

BIOTECHNICAL PRODUCTION AND USE OF PYRUVIC ACID WITH SPECIAL REFERENCE TO COENZYME REGENERATION Ph.D. Thesis - Helsinki Univ.

Hanna-Leena Livio Apr. 1991 102 p

(VTT-Pubs-77; ISBN-951-38-3946-X; ETN-93-93480) Copyright Avail: CASI HC A06/MF A02

The enhancement of pyruvic acid secretion by Candida utilis IFO 0396 was studied with reference to coenzyme regeneration and metabolic modifications. The coenzyme dependent conversion of pyruvate to L-alanine was investigated with immobilized and free enzymes. The aim was to improve pyruvic acid production by Candida utilis by clarifying the metabolic responses to high substrate concentrations and to nitrogen source as well as the role of aeration in the redox balance. Various intracellular modifiers were examined in order to shift the metabolic activity of the yeast towards pyruvic acid overproduction. Pyruvic acid was used for amino acid production with the specific aims of investigating the coupled enzyme system in coenzyme regeneration and comparing the possibilities of different enzyme immobilization methods. NONLINEAR OPTICAL PROPERTIES OF PORPHYRIN AND CHLOROPHYLL DIMERS STUDIED BY DEGENERATED FOUR WAVE MIXING

L. X. Q. Chen 1992 5 p Presented at the International Society for Optical Engineering (SPIE) Conference, Los Angeles, CA, 16-23 Jan. 1993

(Contract W-31-109-eng-38)

(DE93-006411; ANL/CHM/CP-78537; CONF-930159-3) Avail: CASI HC A01/MF A01

As one of the important elements in natural and artificial electron transfer and energy transfer processes, porphyrin and its derivatives have received much attention in photoelectronics and photoelectronic materials. As our first attempt to relate the pi-pi electronic couplings between porphyrin macrocycles to apparent third order nonlinear susceptibilities, we measured chi(sup 3) for several porphyrin and chlorophyll a derivatives, including dimers with different configurations. Our preliminary results show that the dimers have enhanced chi(sup 3) compared to those of the monomer. This enhancement is related to the relative orientations between the two macrocycles in the dimers. The parallel dimers with close face-to-face distances seem to have the highest enhancement in chi(sup 3). Thus, we believe that chi(sup 3) is strongly related to the pi-pi electronic coupling between the two conjugated ring systems. DOE

The objective of this program is to investigate behavioral and neuroendocrine effects associated with exposure to 60-Hz electric and magnetic fields (E/MF), using the baboon (Papio cynocephalus) as a nonhuman primate surrogate for the human. Results from this program, along with information from experiments conducted elsewhere, could be used to estimate and evaluate the likelihood of deleterious consequences of human exposure to the electric and magnetic fields associated with electric power transmission. CANDIDATE TECHNOLOGIES FOR THE INTEGRATED HEALTH MANAGEMENT PROGRAM Final Report, 30 Oct. 1992 - 26 Feb. 1993
Neal F. Johnson and Fred H. Martin 26 Feb. 1993 16 p
(NASA Order H-18763-D)
(NASA-CR-192339; NAS 1.26:192339; Rept-93H-C-006) Avail: CASI HC A03/MF A01

The purpose of this report is to assess Vehicle Health Management (VHM) technologies for implementation as a demonstration. Extensive studies have been performed to determine technologies which could be implemented on the Atlas and Centaur vehicles as part of a bridging program. This paper discusses areas today where VHM can be implemented for benefits in reliability, performance, and cost reduction. VHM Options are identified and one demonstration is recommended for execution. Derived from text

ADAPTIVE FILTERS FOR MONITORING LOCALIZED BRAIN ACTIVITY FROM SURFACE POTENTIAL TIME SERIES
M. E. Spencer and R. M. Leahy 1992 7 p Presented at the 26th Annual Asilomar Conference on Signals, Systems, and Computers, Pacific Grove, CA, 25-30 Oct. 1992
(Contract W-7405-eng-36)
(DE93-003795; LA-UR-92-3645; CONF-9210231-3) Avail: CASI HC A02/MF A01

We address the problem of processing electroencephalographic (EEG) data to monitor the time series of the components of a current dipole source vector at a given location in the head. This is the spatial filtering problem for vector sources in a lossy, three dimensional, zero delay medium. Dipolar and distributed sources at other than the desired location are cancelled or attenuated with an adaptive linearly constrained minimum variance (LCMV) beamformer. Actual EEG data acquired from a human subject serves as the interference in a case where the desired source is simulated and superimposed on the actual data. It is shown that the LCMV beamformer extracts the desired dipole time series while effectively canceling the subjects interference. DOE

TWO TECHNIQUES FOR MEASURING LOCOMOTION IMPACT FORCES DURING ZERO G

Michael C. Greenisen, Richard A. Smith (McDonnell-Douglas Space Systems Co., Houston, TX.), Glenn K. Klute, and James B. McCaulley (McDonnell-Douglas Space Systems Co., Houston, TX.) Apr. 1993 6 p

(NASA-TP-3305; S-699; NAS 1.60:3305) Avail: CASI HC A02/MF A01

A load-cell-instrumented treadmill mated to a Kistler force plate was used to investigate two methods of force measurement instrumentation during treadmill ambulation in zero g, created by parabolic flight on NASA's KC-135 aircraft. Current spaceflight treadmills do not have adequate instrumentation to determine the resultant foot impact force applied during restrained ambulation. Accurate measurement of foot-ground reaction forces is critical in attaining proper one-g loading, therefore ensuring proper musculoskeletal conditioning. Treadmill instrumentation and force plate measurements were compared for frequency response and linearity. Locomotion impact data were also collected under one-g laboratory settings and in Keplerian flight. The first resonant frequency for both techniques was found to be well above the primary frequency content of the locomotive forces. Peak impact forces measured by the two systems compared to within 10 percent. Author

STUDY OF SCN NEUROCHEMISTRY USING IN VIVO MICRODIALYSIS IN THE CONSCIOUS BRAIN: CORRELATION WITH CIRCADIAN ACTIVITY RHYTHMS Final Report, 1 Nov. 1989 - 31 Oct. 1992

J. D. Glass, U. E. Hauser, W. Randolph, S. Ferriera, and M. A. Rea 29 Dec. 1992 14 p

(Grant AF-AFOSR-0047-90)

(AD-A259803; AFOSR-93-0031TR) Avail: CASI HC A03/MF A01

The central aim of this research is to provide information on the neurochemical processes that underlie the generation and entrainment of mammalian circadian rhythms. The studies are centered around the newly-developed in vivo brain microdialysis technique for assessing the daily patterns of neurotransmitter release in the suprachiasmatic nuclei (SCN) of freely-behaving hamsters. During the funded period, this approach yielded several new findings related to the activities of serotonergic and excitatory amino acid systems in the SCN. Specifically, it was found that: there are daily variations in extracellular concentrations of 5-HIAA and glutamate in the SCN, with highest levels occurring at night; the daily release pattern of glutamate, but not serotonin, in the SCN is circadian in nature; the rhythm in glutamate measured in SCN microdialysate is based upon a non-synaptic, calcium-dependent mechanism and does not appear to be directly linked to the expression of locomotory behavior; and serotonergic transmission suppresses glutamate in SCN microdialysate, an effect possibly related to a modulatory effect of serotonin on glutamate release in the SCN. This also may be closely related to our finding that serotonin blocks light-induced Fos protein expression in the SCN. GRA

COMPARISON OF TOTAL BODY WATER ESTIMATES FROM O-18 AND BIOELECTRICAL RESPONSE PREDICTION EQUATIONS

Linda H. Barrows (Krug Life Sciences, Inc., Houston, TX.), L. Daniel Inners (Krug Life Sciences, Inc., Houston, TX.), Marcella D. Stricklin (Krug Life Sciences, Inc., Houston, TX.), Peter D. Klein (Baylor Univ., Dallas, TX.), William W. Wong (Baylor Univ., Dallas, TX.), and Steven F. Siconolfi Apr. 1993 11 p

(NASA-TP-3299; S-696; NAS 1.60:3299) Avail: CASI HC A03/MF A01

Identification of an indirect, rapid means to measure total body water (TBW) during space flight may aid in quantifying hydration status and assist in countermeasure development. Bioelectrical response testing and hydrostatic weighing were performed on 27 subjects who ingested O-18, a naturally occurring isotope of oxygen, to measure true TBW. TBW estimates from three bioelectrical response prediction equations and fat-free mass (FFM) were compared to TBW measured from O-18. A repeated measures MANOVA with post-hoc Dunnett's Test indicated a significant (p less than 0.05) difference between TBW estimates from two of the three bioelectrical response prediction equations and O-18. TBW estimates from FFM and the Kushner & Schoeller (1986) equation yielded results that were similar to those given by O-18. Strong correlations existed between each prediction method and O-18; however, standard errors, identified through regression analyses, were higher for the bioelectrical response prediction equations compared to those derived from FFM. These findings suggest (1) the Kushner & Schoeller (1986) equation may provide a valid measure of TBW, (2) other TBW prediction equations need to be identified that have variability similar to that of FFM, and (3) bioelectrical estimates of TBW may prove valuable in quantifying hydration status during space flight. AFTERRISE: DEEP BODY TEMPERATURE FOLLOWING EXERCISE Technical Note

S. Tuck and A. A. Keefe Apr. 1992 18 p

(AD-A259887; DREO-92-8) Avail: CASI HC A03/MF A01

The continued increase in rectal temperature seen after exercising in the heat is studied. Also, during recovery, the effects of posture and clothing during recovery, and temperature of the recovery room were examined. Five men exercised at a moderate intensity of 35 C and 50 percent relative humidity (RH) until their rectal temperatures reached 38.5 C. All subjects then recovered at a room temperature of 35 C or 22 C, while in a sitting or lying posture. These conditions were evaluated while the subject recovered wearing a Canadian Forces Chemical Warfare (CW) overgarment or light clothing (combat pants or shorts and a short sleeved shirt). This resulted in a total of 8 trials per subject. Rectal and skin temperatures were measured each minute during exercise and recovery. After exercise, rectal temperature increased above 38.5 C, however, this increase was slight. Posture and clothing as well as recovery environment affected the magnitude of this afterrise. It was concluded that the optimal condition in this experiment which minimized the post exercise temperature afterrise, was recovery at 22 C while sitting without the CW overgarment. GRA

A LINEAR, TIME-VARYING SIMULATION OF THE RESPIRATORY TRACT SYSTEM Ph.D. Thesis

O. Hernandez Nov. 1992 112 p

(Contract DE-FG05-88ER-60707)

(DE93-004515; DOE/ER-60707/T3) Avail: CASI HC A06/MF A02

These results show that regional deposition efficiencies of inhaled particles are highly dependent on the level of physical activity in all the spectrum of thermodynamic and aerodynamic aerosol particle sizes; also it was shown that for particles in the aerodynamic size range, the values of regional deposition efficiencies at the inner regions of the lung are highly dependent on age. In addition, the shape of regional deposition efficiency curves as a function of particle size have a similar behavior for all ages; thus, any variation of the airway geometry and respiratory physiological parameters such as tidal volumes and breathing frequencies due to age

difference do not cause a change in the fundamental mechanisms of deposition. Thus, for all the cases of physical activity and age dependency, the deposition of ultrafine aerosol particles is highly enhanced by diffusive processes in all regions of the respiratory tract, and for very large aerosol size particles this behavior is repeated again due to impaction and sedimentation mechanisms. Although the results presented at this work, are the result of computer simulations based on different sources of experimental data, the structure of the computer simulation code BIODEP is flexible enough to the acquisition of any kind of new experimental information in terms of biokinetic analysis and regional deposition parameters. In addition, since the design of BIODEP was intended for easy access to the users, then with exception of the subroutine DIVPAG, at this moment, the modular design of BIODEP using FORTRAN 77 allows the implementation of all the subroutines of BIODEP to be used in an interactive mode with any microcomputer. SURVEY OF AVIATION MEDICAL EXAMINERS: INFORMATION AND ATTITUDES ABOUT THE PRE-EMPLOYMENT AND PRE-APPOINTMENT DRUG TESTING PROGRAM Final Report

Jennifer G. Myers Mar. 1992 42 p

(FAA Proj. AM-C-90/91-HRR-122)

(DOT/FAA/AM-92/15) Avail: CASI HC A03/MF A01

Aviation medical examiners who are designated to collect urine specimens were surveyed to collect information and assess attitudes about different aspects of the pre-employment and pre-appointment drug testing program. Fifty-seven percent of the sample responded to the survey. Respondents were generally positive about the custody and control form, the amount of information received about the collection kits and the drug testing program, and the contacts they had with the agency medical staff. However, only about half reported they had been informed of drug testing program changes. Accurate completion of custody and control forms and lack of training were cited most often as casual factors in the occurrence of errors in the specimen collection process and few had actually received information on their error rate in specimen collections. Recommendations were made to: (1) review the custody and control form for possible improvement that may reduce errors; (2) restrict the number of AME's designated to collect specimens; (3) provide training classes, materials, or videotapes, especially for newly designated AME's, and (4) clarify the alcohol and drug abatement program manager's position prior to a decision about the organizational location of the manager. The assessment of stress resistance in the selection of applicants for air traffic control, is addressed. Stress resistance was evaluated as a multivariate diagnosis of reactivity of stress reactions (behavioral observations, self ratings of mood, peripheral physiological parameters, and cortisol in saliva). The reaction data was collected during a computer based air traffic control test. Most of the subjects showed stress reactions elicited by the test. In order to improve the assessment of stress resistance the formation of a performance strain index was recommended, which can identify different performance strain types when self ratings of mood, behavioral, and performance data are included. Deep saturation dives which can lead to a complex central nervous system disorder, known as HPNS (High Pressure Neurological Syndrome), are addressed. In a dry chamber dive using helium-oxygen as the breathing gas, early and late auditory evoked potentials were repeatedly recorded in two divers. Prolonging the latencies of waves 3 and 5 within the Brainstem Auditory Evoked Potentials (BAEP) correlated highly with vestibular and motor signs of HPNS at 525 m during compression. It is assumed that the ponto-mesencephale brainstem is the primary locus of the disorder because wave 1, which indicates the response of the auditory nerve, was nearly unchanged. Clinical HPNS signs largely disappeared during isopression at 545 m, as did BAEP changes. Therefore, not absolute pressure by excessive compression rate at critical depth range was probably the most important factor. Increasing prolongation of reaction time was observed in the Sternberg Memory Search Task (MST) until 545 m. The effect was dependent on number of letters to be memorized, yielding an increase in the 'slope' parameter of Sternberg's model. This points to an increase in memory scanning rate. Latency of P300 wave of the late potentials was prolonged in a similar way, if the eliciting stimuli were embedded in a secondary task performed in combination with MST. It is concluded that the environmental conditions of extreme diving depths, impair primarily the function of 'working memory' among the components of higher brain functions. Its variable expenditure is measurable by P300 values. ESA

Between October 1, 1991 and September 30, 1992, progress was made in four areas. First, the capabilities of SNNAP, a general purpose Simulator for Neural Networks and Action Potentials, were enhanced by incorporating mathematical descriptions of intracellular levels of Ca2(+) and second messenger systems, which in turn modulate membrane conductances. Second, cellular mechanisms underlying operant conditioning were investigated in simulations of neural networks with biologically realistic properties. In one neural network, a learning rule (activity-dependent neuromodulation), which has been proposed as a cellular mechanism for classical conditioning, was demonstrated to support many features of operant conditioning. A second neural network was developed that simulates the biophysical properties of the neurons and synaptic interactions in a central

pattern generator (CPG) underlying aspects of feeding behavior - a behavior that can be modified by operant conditioning. Third, experiments characterized the modulatory actions of transmitters on the synaptic connections and the intrinsic biophysical properties of neurons in the feeding CPG. Fourth, extensions were made to the single-cell model of associative learning by incorporating quantitative descriptions of the modulation of membrane currents by 5-HT. GRA

(Grant AF-AFOSR-0196-91)
(AD-A260514; AFOSR-93-0027TR) Avail: CASI HC A01/MF A01

The vertebrate retina sequentially transforms patterns of neural activity through 5 separate, serially arranged sheets of cells. These neuronal patterns become increasingly complex at each successive layer. Our objective is to determine the parameters in space and time for the transfer functions that transform the patterns at successive layers. We have extracted the space and time constants for retinal processing from the physiological data taken from single cells at each retinal layer. These space-time parameters drive an image processing computer, the PIPE. The resulting program represents a tentative blueprint for design of a retina, and some of these values have been used by modelers to make artificial retinas, including the recently developed silicon retina. (PB93-132678; PPRP/PPSE-T-37) Avail: CASI HC A10/MF A03

Over the past 20 years, a number of scientific studies have suggested that exposure to 60-hertz (Hz) electric and magnetic field (EMF) may be associated with human health effects, including an increased risk of cancer. Common sources of 60-Hz electric and magnetic fields include power lines, electrical wiring, ground return currents, and appliances. Some epidemiology studies have found a link between EMF exposure and certain types of cancer; however, the results of these studies are not conclusive. The scientific research that has been conducted to date (including epidemiology studies and research conducted on whole animals and cells, as well as human volunteers) has been unable to positively prove or disprove the existence of significant health effects from EMF. This report presents the major results, activities, and findings of current and ongoing EMF-related health effects research covering the time period June 1991 to May 1992. The report reviews research results from epidemiology studies, human studies, whole animal investigations, cell-level laboratory studies, exposure assessments, and engineering studies. Author

Evidence that intersubject differences in the ability to process motion-defined (MD) shape are not predicted by the ability to process luminance-defined (LD) shape, that motion is processed by hierarchical manner, that discrimination and detection can be dissociated for MD form, and that spatial discrimination for MD and LD form are not entirely mediated by the same mechanism is as follows. Reducing presentation duration or dot lifetime from 1.0 to 0.1 sec progressively reduced the visibility of a MD bar, but did not reduce orientation discrimination for the bar when visibility was held constant. Detection and/or recognition of MD letters can be degraded by removal of brain tissues underlying prestriate cortex without affecting contrast sensitivity, Snellen acuity, low contrast acuity or sensitivity to motion. Shape discrimination for an MD rectangle can be as low as 2-3 percent--as good as for an LD rectangle. Evidence for a neural mechanism sensitive to shape independently of size, evidence for a neural mechanism directly sensitive to time to collision with an approaching object, a method for measuring intersubject differences in discrimination of time to contact, a titration method for uncovering the color-defined form system, and the 40 Hz human brain response indexes magnocellular activity is discussed. By recording the magnetic field of the brain we have identified an audio-visual integration area in the brain, we have also unconfounded responses to texture-defined form. GRA

WHY DO WE SEE THREE-DIMENSIONAL OBJECTS?
Thomas Marill Jun. 1992 32 p
(Contract N00014-85-K-0124)
(AD-A259892; AI-M-1366) Avail: CASI HC A03/MF A01

When we look at certain line-drawings, we see three-dimensional objects. The question is why. Why not just see two-dimensional images? Our theory is that we see the objects rather than the images because the objects are simpler than the images. We define the complexity of an object as the number of bits in a pose-independent, binary representation of that object. We examine a number of examples and find that in each case the seen object is indeed simpler than the given image. This leads us to our second question. Given that we are going to see a three-dimensional object when we look at a line-drawing, which three-dimensional object will we see? Our theory is that the vision system will pick the simplest object from among the infinite set of possibilities. We examine a number of examples and find that in each case the data is consistent with the theory. This work is based on the pioneering ideas of Solomonoff and Kolmogorov, and on the more recent minimum description length concepts of Rissanen. GRA

Work to further develop a test system for the selection of student pilots is presented. Its completion by two further tests, the analysis of the personality questionnaire with regard to the intercultural comparability of its psychometric qualities, as well as the translation of the test system into Spanish language, and the results of several selection campaigns, are reported. The introduction of the two further tests, for auditory memory and for visual (short term) perception, is described. Improvements to tasks and evaluation of the simulator test which emerged during testing are reported. One group of applicants completely underwent the whole test system (those who would normally have been de-selected after paper and pencil tests were taken into the apparatus test phase) and this data analysis is given. TRAINING HIGH PERFORMANCE SKILLS USING ABOVE REAL-TIME TRAINING Final Report
Dutch Guckenberger, Kevin C. Uliano (University of Central Florida, Orlando.), and Norman E. Lane (University of Central Florida, Orlando.) Jan. 1993 58 p
(Grant NAG2-750)
(NASA-CR-192616; NAS 1.26:192616) Avail: CASI HC A04/MF A01

The Above Real-Time Training (ARTT) concept is a unique approach to training high performance skills. ARTT refers to a training paradigm that places the operator in a simulated environment that functions at faster than normal time. Such a training paradigm represents a departure from the intuitive, but not often supported, feeling that the best practice is determined by the training environment with the highest fidelity. This approach is hypothesized to provide greater 'transfer value' per simulation trial, by incorporating training techniques and instructional features into the simulator. These techniques allow individuals to acquire these critical skills faster and with greater retention. ARTT also allows an individual trained in 'fast time' to operate at what appears to be a more confident state, when the same task is performed in a real-time environment. Two related experiments are discussed. The findings appear to be consistent with previous findings that show positive effects of task variation during training. Moreover, ARTT has merit in improving or maintaining transfer with sharp reductions in training time. There are indications that the effectiveness of ARTT varies as a function of task content and possibly task difficulty. Other implications for ARTT are discussed along with future research directions. Author (revised)

INTERPRETATION AS ABDUCTION
Jerry R. Hobbs, Mark Stickel, Douglas Appelt, and Paul Martin 1992 68 p
(Contracts N00014-85-C-0013; N00014-90-C-0220)
(AD-A259608) Avail: CASI HC A04/MF A01

Abduction is inference to the best explanation. In the TACITUS project at SRI we have developed an approach to abductive inference, called weighted abduction, that has resulted in a significant simplification of how the problem of interpreting texts is conceptualized. The interpretation of a text is the minimal explanation of why the text would be true. More precisely, to interpret a text, one must prove the logical form of the text from what is already mutually known, allowing for coercions, merging redundancies where possible, and making assumptions where necessary. It is shown how such local pragmatics problems as reference resolution, the interpretation of compound nominals, the resolution of syntactic ambiguity and metonymy, and schema recognition can be solved in this manner. Moreover, this approach of interpretation as abduction can be combined with the older view of parsing as deduction to produce an elegant and thorough integration of syntax, semantics, and pragmatics, one that spans the range of linguistic phenomena from phonology to discourse structure. Finally, we discuss means for making the abduction process efficient, possibilities for extending the approach to other pragmatics phenomena, and the semantics of the weights and costs in the abduction scheme. EYE MOVEMENTS AND VISUAL INFORMATION PROCESSING Annual Report, 30 Sep. 1991 - 29 Sep. 1992
Eileen Kowler 1992 4 p
(Grant AF-AFOSR-0342-91)
(AD-A259955; AFOSR-93-0024TR) Avail: CASI HC A01/MF A01

The central goal of the project funded by the current grant is the understanding of how saccadic eye movements are used to accurately localize objects in space. Explaining accurate localization is a real problem because the objects we choose to look at are relatively large -- typically extending over several degrees of space -- but the saccadic eye movement must land at one place within the target. Our published research suggests that the computation requires a sequence of two stages: (1) voluntary attentional weighting of information in the visual display, and (2) automatic-spatial-pooling of the weighted formation (He and Kowler, 1989; 1991). GRA

THE FIVE-FACTOR PERSONALITY MODEL AND NAVAL AVIATION CANDIDATES
Kathleen T. Helton and David R. Street, Jr. Nov. 1992 16 p
(DA Proj. M00-96; DA Proj. M00-96)
(AD-A260227; NAMRL-1379) Avail: CASI HC A03/MF A01

As personality testing has improved, various models for constructing and interpreting aviation selection tests have been proposed. Of particular interest to our study is the use of the five-factor personality model to naval aviation selection test interpretation and development. The five personality factors are conscientiousness, agreeableness, openness, extraversion, and neuroticism. Therefore, we conducted a joint factor analysis on the Pilot Personality Questionnaire (PPQ) and the Edwards Personal Preference Schedule (EPPS) taken by 158 Navy and Marine Corps student aviators. A principal component analysis (PCA) and a factor analysis (FA) with varimax rotations produced a robust five-factor solution. On the basis of content analysis, the FA factors obtained in our study coincided with the five classic dimensions of the five-factor personality model. Although investigations of personality in pilot selection have yielded mixed results, the finding of a five-factor solution in our study suggests that the five-factor personality model may be useful in personality testing in aviation selection decisions. HUMAN VISUAL LIMITATIONS ON SUPRATHRESHOLD CONTRAST PERCEPTION THROUGH ANVIS Final Report
Jeff C. Rabin Dec. 1992 24 p
(DA Proj. 3M1-62787-A-879)
(AD-A259970; USAARL-93-3) Avail: CASI HC A03/MF A01

Recent success on the battlefield underscored the tactical advantage of night operations and image intensifying devices. It is important to understand both the benefits and limitations inherent in these devices. While several studies have focused on spatial resolution thresholds through image intensifiers, less is known about visual perception at suprathreshold levels of stimulation. Such information is necessary to anticipate and predict visual performance under various conditions. In this study contrast matching was used to evaluate suprathreshold visual perception under conditions which simulated the luminance, contrast, and chromaticity of third generation image intensifiers contained in the Aviator's Night Vision Imaging System (ANVIS). The apparent contrast of letters in this simulated ANVIS environment was reduced by a factor of two when compared to normal photopic levels of stimulation. This effect was attributed to limitations of the human visual system in processing higher spatial frequencies at low light levels. Theme results help to quantify and discriminate between visual and electro-optical limitations on vision through image intensifiers. GRA

USER AREAS IN AIRCRAFT COCKPIT, USING METHODS OF RAPID PROTOTYPE DEVELOPMENT [BENUTZEROBERFLAECHEN IM FLUGZEUGCOCKPIT MIT METHODEN DER SCHNELLEN PROTOTYPENENTWICKLUNG]
Alexander Rumpf and Burkhard Balser Sep. 1990 13 p In GERMAN Presented at 33rd DGLR Fachausschusssitzung, Hamburg, Germany, 25-26 Sep. 1990 Submitted for publication
(MBB-FE-315-S-PUB-0493; ETN-93-93435) Avail: CASI HC A03/MF A01

A study which shows that System Prototyping Rig (SPR) is a development implement which meets perfectly with the present requirements of a modern system implement is presented. SPR allows compliance with the most important tasks in the development phases of the new system. The application of such an implement leads to a minimization of development risks, used time, and costs. The software package Virtual Avionics Prototyping System (VAPS) is described as a tool for the generation of virtual, interactive man machine interface. A permanent further development and a continuous adaptation of new technologies are necessary to obtain the efficiency of the tool. ESA

INTEGRATED OXYGEN RECOVERY SYSTEM Bimonthly Technical Progress Report No. 1, 8 Jan. - 8 Mar. 1993
M. Gene Lee and Ronald J. Davenport 8 Mar. 1993 21 p
(Contract NAS8-39843)
(NASA-CR-192343; NAS 1.26:192343; TR-1619-1-1) Avail: CASI HC A03/MF A01

Life Systems has conceptualized an innovative Integrated Oxygen Recovery System (IORS) applicable to advanced mission air revitalization. The IORS provides the capability to electrochemically generate metabolic oxygen (O2) and recover O2 from the space habitat atmosphere via a carbon dioxide (CO2) reduction process within a single assembly. To achieve this capability, the IORS utilizes a Solid Metal Cathode (SMC) water electrolysis unit that simultaneously serves as the Sabatier CO2 reduction reactor. The IORS enables two major life support systems currently baselined in closed loop air revitalization systems to be combined into one smaller, less complex system. This concept reduces fluidic and electrical interface requirements and eliminates a hydrogen (H2) interface. Life Systems is performing an evaluation of the IORS process directed at demonstrating performance and quantifying key physical characteristics including power, weight, and volume. Technical progress achieved during the first two months of the program is summarized. Author

EVALUATION OF HOLE SIZES IN STRUCTURES REQUIRING EVA SERVICES AS A MEANS TO PREVENT GLOVED-HAND FINGER ENTRAPMENT
Sudhakar L. Rajulu (Lockheed Engineering and Sciences Co., Houston, TX.) and Glenn K. Klute Apr. 1993 15 p
(Contract NAS9-17900)
(NASA-TM-104767; S-717; NAS 1.15:104767; LESC-30689) Avail: CASI HC A03/MF A01

One of the concerns of Space Station designers was making sure that the suited crewmembers' gloved fingers are not trapped in the holes that may be present in the structures during EVA activities. A study was conducted on 11 subjects to determine the minimum and maximum possible hole sizes that would eliminate the possibility of finger entrapment. Subjects wore pressurized gloves and attempted to insert their fingers into holes of various sizes. Based on the experimental results, it is recommended that the smallest diameter should be less than 13.0 mm and the largest diameter should be greater than 35.0 mm in order to eliminate the possibility of

finger entrapment while wearing gloves. It is also recommended that the current requirements specified by the MSIS-STD-3000 (Section 6.3.3.4) should be modified accordingly. Author

THE EFFECTS OF DISPLAY AND RESPONSE CODES ON INFORMATION PROCESSING IN AN IDENTIFICATION TASK Ph.D. Thesis Final Report

Jeffrey G. Morrison 23 Sep. 1992 341 p

(AD-A259531; NAWACDWAR-92088-60; NADC-92088-60) Avail: CASI HC A15/MF A03

Four experiments are reported that employ the Within-Task Subtractive (WiTS) method for partitioning response time. The assumptions and advantages of this methodology are discussed relative to subtractive and additive factors methodology. Code and coding issues such as the particular target-task combination used, response mapping, target density, and blocks were manipulated. Study 1 showed that digits were processed differently from letters in terms of input and output processing. Study 2 showed that the identification of different categories of codes in the presence of noise codes generated different effects on input and output processing. Study 3 examined the identification of codes from multiple code categories when there is a single code per target versus when there are multiple codes per target. The results show that while there are differences in input processing depending on the location of codes, when the results are considered on a per-code basis, the differences in input are accounted for by the different number of visual fixations required, rather than differences in processing. Study 4 examined the effects of identifying redundant codes. Redundant codes were processed as separate codes early in practice, and processed as a single, composite code late in practice during input, and were output much faster than relevant, non-redundant codes in output. HUMAN FACTORS ISSUES IN AIRCRAFT MAINTENANCE AND INSPECTION. SCIENCE, TECHNOLOGY, AND MANAGEMENT: A PROGRAM REVIEW

Aug. 1992 252 p Meeting held in Atlanta, GA, 5-6 Aug. 1992

(Contract DTFA01-92-Y-01005)

(PB93-146975) Avail: CASI HC A12/MF A03

The report presents the proceedings of the seventh in a series of meetings sponsored by the Federal Aviation Administration (FAA). These meetings address issues of human factors in aviation maintenance and inspection. This two-day meeting, in August 1992, directed attention to science, technology, and management. This triad was addressed by eighteen speakers from industry, government, the Department of Defense, and academia. Many of the presentations served as a review of the Human Factors in Aviation Maintenance Research Program. The Office of Aviation Medicine Human Factors in Aviation Maintenance Research Program has responded to many of the topics in the National Plan for Aviation Human Factors. The National Plan combines issues of science and technology with a management plan to define approaches to a broad range of human factors issues in aviation. The MM's responses are presented. The responses address topics related to work environments, tools, procedures, training, documentation, and innovative maintenance management practices. The Aviation Medicine research is complimented by presentations from airline, manufacturers, and Department of Defense personnel. GRA

COMPARATIVE EVALUATION OF A MONOCULAR HEAD MOUNTED DISPLAY DEVICE VERSUS A FLAT SCREEN DISPLAY DEVICE IN PRESENTING AIRCRAFT MAINTENANCE TECHNICAL DATA M.S. Thesis

Jeffrey A. Friend and Randy S. Grinstead Sep. 1992 166 p

(AD-A259684; AFIT/GSM/LSM/92S-8) Avail: CASI HC A08/MF A02

As military developers provide increasingly complex weapon systems, it becomes more difficult for maintenance technicians to perform their jobs. One aspect of the technicians' world is the need to access technical information in the performance of their duties. This study investigated two electronic display systems to evaluate which enhanced technician performance more. A Head Mounted Display (HMD) device and a portable hand-held flat-screen computer were evaluated in the performance of two flightline maintenance activities. Although both display systems were fully portable and self contained, only the HMD system allowed continuous access to technical information during task performance. In most cases, technicians using the IBM system outperformed those equipped with the flat-screen computer system in terms of effectiveness and efficiency. GRA

IN-FLIGHT FIELD-OF-VIEW WITH ANVIS Final Report

John C. Kotulak Dec. 1992 69 p

(DA Proj. 3M1-62787-A-879)

(AD-A259905; USAARL-93-8) Avail: CASI HC A04/MF A01

This investigation had four major goals: (1) to measure the in-flight field-of-view (FOV) of a large sample of aviators (n = 105) using the AN/AVS-6 Aviator's Night Vision Imaging System (ANVIS); (2) to assess the degree to which in-flight ANVIS FOV restrictions result from improper user adjustments as opposed to equipment limitations; (3) to determine which epidemiological factors might be associated with reduced FOV; and (3) to evaluate options for optimizing in-flight ANVIS FOV. It was concluded that only about 15 percent of aviators actually achieve a 40 deg FOV with ANVIS during flight. The FOV's were reduced mostly because of equipment limitations, and not because of user misadjustments. Specifically, the fore-aft adjustment of the ANVIS helmet mount lacks sufficient range in the aft direction. Among the epidemiological factors studied, only total flight hours, hours in current aircraft, hours in last 12 months, and aircraft type are statistically related to in-flight ANVIS FOV. Total night vision goggle flight hours, ANVIS flight hours, helmet size, type of helmet liner, and spectacle use are not related to in-flight ANVIS FOV. Finally, it was determined that most aviators could achieve a 40 deg FOV if either of two hardware modifications were made: improving the fore-aft adjustment range of the ANVIS mount, or switching to a different eyepiece with a greater eye relief. GRA

EFFECTS ON PHYSIOLOGY AND PERFORMANCE OF WEARING THE AVIATOR NBC ENSEMBLE WHILE FLYING THE UH-60 HELICOPTER FLIGHT SIMULATOR IN A CONTROLLED HEAT ENVIRONMENT Final Report, Aug. 1989 - Nov. 1991

Robert Thornton, J. L. Caldwell, Wayne Clark, Frank Guardiani, and Jose Rosario Sep. 1992 173 p

(AD-A259909; USAARL-92-36) Avail: CASI HC A08/MF A02

The physiological and performance effects of wearing U.S. Army aviator NBC individual protective equipment (IPE) were evaluated in the USAARL UH-60 research flight simulator. Sixteen male aviators flew the simulator in four test conditions: standard flight suit and cool cockpit, standard flight suit and hot cockpit, NBC IPE and cool cockpit, and NBC IPE and hot cockpit. The hot condition had a wet bulb globe temperature (WBGT) of 30.6 C, the cool 17.9 C. Rectal temperature, mean skin temperature, and heart rate were monitored and showed significant increases for the NBC hot condition compared with the other three. There was a significant degree of dehydration in the hot NBC condition. Seven subjects failed to complete the sortie in the NBC hot condition, with a mean survival time of 298 minutes. All subjects flew for the target 6 hours in the other conditions. Simulator flight performance showed significant impairment in the hot NBC condition. There was little evidence of a reduction in flight performance with time. Six crashes occurred in NBC IPE, one in the standard flight suit. A performance assessment battery also was undertaken before, and at regular intervals during flight. The battery showed no effect of condition, though it was sensitive to increasing time on each test day. A subjective questionnaire assessment showed increasing fatigue with time, and that all conditions produced significantly more fatigue than baseline with the worse being for NBC hot. GRA

ATTENTION FACTORS ASSOCIATED WITH HEAD-UP DISPLAY AND HELMET-MOUNTED DISPLAY SYSTEMS Final Report, Jul. - Dec. 1991

John C. Morey and Robert Simon Jan. 1993 64 p

(Contract MDA903-87-C-0523)

(AD-A260204; E-19298U; ARI-RN-93-12) Avail: CASI HC A04/MF A01

A review of human attention research literature relevant to head-up display (HUD) and helmet-mounted display (HMD) systems in use or under development for rotary-wing aircraft is presented. The fundamental attentional

issue for HUD's and HMD's is division of attention between the outside-the-window scene and the displayed symbology. Selective attention applies more to elements within the HUD or HMD symbology. The review identified a number of areas for further research. These are effects of dichoptic viewing, eye dominance, identification of strategies for effective time-sharing, HUD and HMD training, and pilot selection. GRA

PERCEPTION/ACTION: AN HOLISTIC APPROACH Final Report, 15 Dec. 1990 - 29 Aug. 1992
John M. Flach Oct. 1992 46 p
(Grant AF-AFOSR-1051-91)
(AD-A259597; WSU-FR-661805; AFOSR-92-1019TR) Avail: CASI HC A03/MF A01

A general systems approach is taken to studying the emergent properties of the human perception/action system. Two task domains, the control of locomotion and the recognition of objects, are used to study human performance. The locomotion task involves the control of altitude. Experiments are described that will manipulate the type of texture, the speed of forward motion, and altitude. A general hypothesis is presented that performance in the altitude control task is a function of the signal-to-noise ratio within the flow field--where signal refers to optical activity resulting from change of altitude and noise refers to optical activity resulting from other sources. An analysis of the flow geometry is presented to illustrate how the motion of the observer and the position of texture elements combine to determine the optical information available to the observer. The object recognition task involves the discrimination of 3-dimensional wire-frame forms using the information available in dynamic occlusion. A key manipulation within this task was the mode of observation. Observers were either active (they could manipulate the object using a joystick to produce dynamic occlusion) or they were passive (they could observe the motions produced by the active observer, but they could not act on the display to produce dynamic occlusions). Three experiments are presented. The most important result was that no differences were found as a function of mode. In all three experiments passive observers performed at least as well as active observers. GRA

AN INNOVATIVE METHOD FOR HAND PROTECTION FROM EXTREME COLD USING HEAT PIPE Final Report, 1 Jul. 1986 - Feb. 1987
A. Faghri, D. B. Reynolds, and B. Bahramian Dec. 1992 75 p
(AD-A259720; NATICK-TR-93/005) Avail: CASI HC A04/MF A01

Due to the danger of frostbite at very low ambient temperatures, there is a need to develop new handwear technology to protect the fingers at temperatures down to about -80 F (-62 C). The shortcomings of the existing technology, a glove with a heating element, are needed for maintenance, size, and limited capacity of the current batteries. An innovative method was investigated to transfer some of the body core thermal energy to the hands. This method involves the use of heat pipe technology, which has the advantages of very high effective heat conductivity, fast response time, flexibility low mass, compact size, and ease of maintenance. The design uses the person's elbow area as the heat source. The heat pipe extends along the arm and terminates at the surface of the back of the hand. From a simple model of the insulated arm and hand, the required heat transfer to the hand by the heat pipe to maintain a hand temperature of -81 F (27 C) with ambient temperature of -80 F (62 C) was shown to vary from 5.8 to 21 W for an insulation 'R' value from 0.741 to 0.185 m(sup 2)C/W. A very efficient and flexible heat pipe was developed and tested to show the feasibility of the use of heat pipe technology in the above application. Heat capacities between 1 and 5 W were measured, depending upon orientation with respect to gravity. Due to the necessity of transferring 1 to 5 times this amount of heat and to provide for more uniform heat distribution, these results indicate that multiple heat pipes may be required in the design of a handwear system. GRA

ATTITUDE AWARENESS ENHANCEMENTS FOR THE F-16 HEAD-UP DISPLAY Final Report, 1 Mar. - 30 Jun. 1992
Scott M. Cone and John A. Hassoun Oct. 1992 47 p
(AD-A260280; ASC-TR-92-5017) Avail: CASI HC A03/MF A01

In an effort to reduce the Collision With Ground (CWG) and Spatial Disorientation (SDO) mishaps, the F-16 System Program Office (SPO) has initiated an effort to improve F-16 C/D head-up display (HUD) symbology. In support of this effort, the SPO identified a set of attitude awareness enhancements for potential incorporation into the aircraft. These were (1) extended horizon, (2) ghost horizon, (3) articulated nose down pitch bars, (4) removal of 2:1 pitch scale compression, (5) moving nose down pitch bar tic marks to the inside of the pitch bars, (6) modified bank angle indicator, and (7) modified zenith/nadir symbols. Prior to the incorporation of these enhancements, the Crew Station Evaluation Facility (CSEF) performed a simulation evaluation to assess the improvement in attitude awareness provided by these changes. Fifteen pilots flew a series of unusual attitude recoveries and mission demonstration tasks during which reaction time, error rate, and subjective ratings were collected. Results showed faster reaction times, especially in nose-down conditions, and strong subjective preference for the modified HUD format. Based on these results, the CSEF recommended the incorporation of the extended horizon, ghost horizon, modified pitch ladder, and modified zenith/nadir symbols (low priority). Ratings for the bank angle indicator were mixed. It is recommended that the bank angle indicator be evaluated in instrument flying conditions before being considered for incorporation into the F-16 HUD. GRA

AN AUTOMATED METHOD FOR DETERMINING MASS PROPERTIES Final Report
Michael B. Deavers and B. J. McEntire Dec. 1992 33 p
(AD-A259924; USAARL-93-4) Avail: CASI HC A03/MF A01

The U.S. Army Aeromedical Research Laboratory performs mass properties testing with the KSR330-60 Mass Properties Instrument (MPI). For man-mounted equipment, it is important to define and measure the mass properties in order to accurately develop math models, understand human performance impacts, and to conduct comparative evaluations. Determining mass properties requires a thorough theoretical understanding of the center-of-mass and mass moments of inertia. This report provides the operating theory and procedures to measure mass properties with the MPI. GRA

(RTOP 505-64-29)
(NASA-TM-103881; A-91204; NAS 1.15:103881) Avail: CASI HC A03/MF A01

A demonstration of the capability of NASA's Vertical Motion Simulator to simulate two alternative motion base designs for the National Advanced Driving simulator (NADS) is reported. The VMS is located at ARC. The motion base conditions used in this demonstration were as follows: (1) a large translational motion base; and (2) a motion base design with limited translational capability. The latter had translational capability representative of a typical synergistic motion platform. These alternatives were selected to test the prediction that large amplitude translational motion would result in a lower incidence or severity of simulator induced sickness (SIS) than would a limited translational motion base. A total of 10 drivers performed two tasks, slaloms and quick-stops, using each of the motion bases. Physiological, objective, and subjective measures were collected. No reliable differences in SIS between the motion base conditions was found in this demonstration. However, in light of the cost considerations and engineering challenges associated with implementing a large translation motion base, performance of a formal study is recommended. Author (revised)

One of the most challenging applications facing the computer community is development of effective adaptive human-computer interface. This challenge stems from the complex nature of the human part of this symbiosis. The application of this discipline to the environmental restoration and waste management is further complicated due to the nature of environmental data. The information that is required to manage environmental impacts of human activity is fundamentally complex. This paper discusses the efforts at Sandia National Laboratories in developing the adaptive conceptual model manager within the constraint of the environmental decision-making. A computer workstation, that hosts the Conceptual Model Manager and the Sandia Environmental Decision Support System is also discussed. DOE

THE df: A PROPOSED DATA FORMAT STANDARD

Leslie R. Lait (Universities Space Research Association, Columbia, MD.), Eric R. Nash (Applied Research Corp., Landover, MD.), and Paul A. Newman Mar. 1993 181 p

(NASA-TM-4467; NAS 1.15:4467; Rept-93B00047) Avail: CASI HC A09/MF A02

A standard is proposed describing a portable format for electronic exchange of data in the physical sciences. Writing scientific data in a standard format has three basic advantages: portability; the ability to use metadata to aid in interpretation of the data (understandability); and reusability. An improperly formulated standard format tends towards four disadvantages: (1) it can be inflexible and fail to allow the user to express his data as needed; (2) reading and writing such datasets can involve high overhead in computing time and storage space; (3) the format may be accessible only on certain machines using certain languages; and (4) under some circumstances it may be uncertain whether a given dataset actually conforms to the standard. A format was designed which enhances these advantages and lessens the disadvantages. The fundamental approach is to allow the user to make her own choices regarding strategic tradeoffs to achieve the performance desired in her local environment. The choices made are encoded in a specific and portable way in a set of records. A fully detailed description and specification of the format is given, and examples are used to illustrate various concepts. Implementation is discussed. Author

ADVANCING AUTOMATION AND ROBOTICS TECHNOLOGY FOR THE SPACE STATION FREEDOM AND FOR THE U.S. ECONOMY Progress Report No. 13

Nov. 1991 49 p

(RTOP 476-14-01)

(NASA-TM-103895; A-91235; NAS 1.15:103895) Avail: CASI HC A03/MF A01

In April 1985, as required by Public Law 98-371, the NASA Advanced Technology Advisory Committee (ATAC) reported to Congress the results of its studies on advanced automation and robotics technology for use on Space Station Freedom. This material was documented in the initial report (NASA Technical Memorandum 87566). A further requirement of the law was that ATAC follow NASA's progress in this area and report to Congress semiannually. This report is the thirteenth in a series of progress updates and covers the period between 14 Feb. - 15 Aug. 1991. The progress made by Levels 1, 2, and 3 of the Space Station Freedom in developing and applying advanced automation and robotics technology is described. Emphasis was placed upon the Space Station Freedom Program responses to specific recommendations made in ATAC Progress Report 12, and issues of A&R implementation into Ground Mission Operations and A&R enhancement of science productivity. Assessments are presented for these and other areas as they apply to the advancement of automation and robotics technology for Space Station Freedom. Author (revised)

COMPRESSION THROUGH DECOMPOSITION INTO BROWSE AND RESIDUAL IMAGES **c82**

Dmitry A. Novik (Universal Systems, Inc., Arlington, VA.), James C. Tilton, and M. Manohar (Universities Space Research Association, Greenbelt, MD.) *In its* The 1993 Space and Earth Science Data Compression Workshop Apr. 1993 p 7-12 (For primary document see N93-24544 08-59)

Avail: CASI HC A02/MF A02

Economical archival and retrieval of image data is becoming increasingly important considering the unprecedented data volumes expected from the Earth Observing System (EOS) instruments. For cost effective browsing the image data (possibly from remote site), and retrieving the original image data from the data archive, we suggest an integrated image browse and data archive system employing incremental transmission. We produce our browse image data with the JPEG/DCT lossy compression approach. Image residual data is then obtained by taking the pixel by pixel differences between the original data and the browse image data. We then code the residual data with a form of variable length coding called diagonal coding. In our experiments, the JPEG/DCT is used at different quality factors (Q) to generate the browse and residual data. The algorithm has been tested on band 4 of two Thematic mapper (TM) data sets. The best overall compression ratios (of about 1.7) were obtained when a quality factor of Q=50 was used to produce browse data at a compression ratio of 10 to 11. At this quality factor the browse image data has virtually no visible distortions for the images tested. Author (revised)

APPLICATIONS OF WAVELET-BASED COMPRESSION TO MULTIDIMENSIONAL EARTH SCIENCE DATA **c82**

Jonathan N. Bradley and Christopher M. Brislawn *In* NASA. Goddard Space Flight Center, The 1993 Space and Earth Science Data Compression Workshop Apr. 1993 p 13-24 (For primary document see N93-24544 08-59)

Avail: CASI HC A03/MF A02

A data compression algorithm involving vector quantization (VQ) and the discrete wavelet transform (DWT) is applied to two different types of multidimensional digital earth-science data. The algorithms (WVQ) is optimized for each particular application through an optimization procedure that assigns VQ parameters to the wavelet transform subbands subject to constraints on compression ratio and encoding complexity. Preliminary results of compressing global ocean model data generated on a Thinking Machines CM-200 supercomputer are presented. The WVQ scheme is used in both a predictive and nonpredictive mode. Parameters generated by the optimization algorithm are reported, as are signal-to-noise (SNR) measurements of actual quantized data. The problem of extrapolating hydrodynamic variables across the continental landmasses in order to compute the DWT on a rectangular grid is discussed. Results are also presented for compressing Landsat TM 7-band data using the WVQ scheme. The formulation of the optimization problem is presented along with SNR measurements of actual quantized data. Postprocessing applications are considered in which the seven spectral bands are clustered into 256 clusters using a k-means algorithm and analyzed using the Los Alamos multispectral data analysis program, SPECTRUM, both before and after being compressed using the WVQ program. WAVELET ENCODING AND VARIABLE RESOLUTION PROGRESSIVE TRANSMISSION **c82**
Ronald P. Blanford *In* NASA. Goddard Space Flight Center, The 1993 Space and Earth Science Data Compression Workshop Apr. 1993 p 25-35 (For primary document see N93-24544 08-59)
Avail: CASI HC A03/MF A02

Progressive transmission is a method of transmitting and displaying imagery in stages of successively improving quality. The subsampled lowpass image representations generated by a wavelet transformation suit this purpose well, but for best results the order of presentation is critical. Candidate data for transmission are best selected using dynamic prioritization criteria generated from image contents and viewer guidance. We show that wavelets are not only suitable but superior when used to encode data for progressive transmission at non-uniform resolutions. This application does not preclude additional compression using quantization of highpass coefficients, which to the contrary results in superior image approximations at low data rates. Author

FAST IMAGE DECOMPRESSION FOR TELEBROWSING OF IMAGES **c82**
Shaou-Gang Miaou and Julius T. Tou *In* NASA. Goddard Space Flight Center, The 1993 Space and Earth Science Data Compression Workshop Apr. 1993 p 37-48 (For primary document see N93-24544 08-59)
Avail: CASI HC A03/MF A02

Progressive image transmission (PIT) is often used to reduce the transmission time of an image telebrowsing system. A side effect of the PIT is the increase of computational complexity at the viewer's site. This effect is more serious in transform domain techniques than in other techniques. Recent attempts to reduce the side effect are futile as they create another side effect, namely, the discontinuous and unpleasant image build-up. Based on a practical assumption that image blocks to be inverse transformed are generally sparse, this paper presents a method to minimize both side effects simultaneously. Author

A SURVEY OF QUALITY MEASURES FOR GRAY-SCALE IMAGE COMPRESSION **c82**
Ahmet M. Eskicioglu and Paul S. Fisher *In* NASA. Goddard Space Flight Center, The 1993 Space and Earth Science Data Compression Workshop Apr. 1993 p 49-61 (For primary document see N93-24544 08-59)
Avail: CASI HC A03/MF A02

Although a variety of techniques are available today for gray-scale image compression, a complete evaluation of these techniques cannot be made as there is no single reliable objective criterion for measuring the error in compressed images. The traditional subjective criteria are burdensome, and usually inaccurate or inconsistent. On the other hand, being the most common objective criterion, the mean square error (MSE) does not have a good correlation with the viewer's response. It is now understood that in order to have a reliable quality measure, a representative model of the complex human visual system is required. In this paper, we survey and give a classification of the criteria for the evaluation of monochrome image quality. Author

Yaffe (Toronto Univ., Ontario.), Faina Shtern (National Cancer Inst., Bethesda, MD.), G. Stephen Brown (Research Triangle Inst., Research Triangle Park, NC.), Daniel L. Winfield (Research Triangle Inst., Research Triangle Park, NC.), and Maria Kallergi (University of South Florida, Tampa.) *In* NASA. Goddard Space Flight Center, The 1993 Space and Earth Science Data Compression Workshop Apr. 1993 p 63-74 (For primary document see N93-24544 08-59)
Avail: CASI HC A03/MF A02

The use of digital mammography for breast cancer screening poses several novel problems such as development of digital sensors, computer assisted diagnosis (CAD) methods for image noise suppression, enhancement, and pattern recognition, compression algorithms for image storage, transmission, and remote diagnosis. X-ray digital mammography using novel direct digital detection schemes or film digitizers results in large data sets and, therefore, image compression methods will play a significant role in the image processing and analysis by CAD techniques. In view of the extensive compression required, the relative merit of 'virtually lossless' versus lossy methods should be determined. A brief overview is presented here of the developments of digital sensors, CAD, and compression methods currently proposed and tested for mammography. The objective of the NCI/NASA Working Group on Digital Mammography is to stimulate the interest of the image processing and compression scientific community for this medical application and identify possible dual use technologies within the NASA centers. A STUDY OF VIDEO FRAME RATE ON THE PERCEPTION OF MOVING IMAGERY DETAIL **c82**
Richard F. Haines (RECOM Technologies, Inc., Moffett Field, CA.) and Sherry L. Chuang *In* NASA. Goddard Space Flight Center, The 1993 Space and Earth Science Data Compression Workshop Apr. 1993 p 75-84 (For primary document see N93-24544 08-59)
Avail: CASI HC A02/MF A02

The rate at which each frame of color moving video imagery is displayed was varied in small steps to determine what is the minimal acceptable frame rate for life scientists viewing white rats within a small enclosure. Two, twenty five second-long scenes (slow and fast animal motions) were evaluated by nine NASA principal investigators and animal care technicians. The mean minimum acceptable frame rate across these subjects was 3.9 fps both for the slow and fast moving animal scenes. The highest single trial frame rate averaged across all subjects for the slow and the fast scene was 6.2 and 4.8, respectively. Further research is called for in which frame rate, image size, and color/gray scale depth are covaried during the same observation period. Author

SYSTEMS ASPECTS OF COBE SCIENCE DATA COMPRESSION **c82**
I. Freedman, E. Boggess, and E. Seiler *In* NASA. Goddard Space Flight Center, The 1993 Space and Earth Science Data Compression Workshop Apr. 1993 p 85-97 (For primary document see N93-24544 08-59)
Avail: CASI HC A03/MF A02

A general approach to compression of diverse data from large scientific projects has been developed and this paper addresses the appropriate system and scientific constraints together with the algorithrn development and test strategy. This framework has been implemented for the COsmic Background Explorer spacecraft (COBE) by retrofitting the existing VAS-based data management system with high-performance compression software permitting random access to the data. Algorithms which incorporate scientific knowledge and consume relatively few system resources are preferred over ad hoc methods. COBE exceeded its planned storage by a large and growing factor and the retrieval of data significantly affects the processing, delaying the availability of data for scientific usage and software test. Embedded compression software is planned to make the project tractable by reducing the data storage volume to an acceptable level during normal processing. Author

PROPOSED DATA COMPRESSION SCHEMES FOR THE GALILEO S-BAND CONTINGENCY MISSION **c82**
Kar-Ming Cheung and Kevin Tong *In* NASA. Goddard Space Flight Center, The 1993 Space and Earth Science Data Compression Workshop Apr. 1993 p 99-109 (For primary document see N93-24544 08-59)
Avail: CASI HC A03/MF A02

The Galileo spacecraft is currently on its way to Jupiter and its moons. In April 1991, the high gain antenna (HGA) failed to deploy as commanded. In case the current efforts to deploy the HGA fails, communications during the Jupiter encounters will be through one of two low gain antenna (LGA) on an S-band (2.3 GHz) carrier. A lot of effort has been and will be conducted to attempt to open the HGA. Also various options for improving Galileo's telemetry downlink performance are being evaluated in the event

that the HGA will not open at Jupiter arrival. Among all viable options the most promising and powerful one is to perform image and non-image data compression in software onboard the spacecraft. This involves in-flight re-programming of the existing flight software of Galileo's Command and Data Subsystem processors and Attitude and Articulation Control System (AACS) processor, which have very limited computational and memory resources. In this article we describe the proposed data compression algorithms and give their respective compression performance. The planned image compression algorithm is a 4 x 4 or an 8 x 8 multiplication-free integer cosine transform (ICT) scheme, which can be viewed as an integer approximation of the popular discrete cosine transform (DCT) scheme. The implementation complexity of the ICT schemes is much lower than the DCT-based schemes, yet the performances of the two algorithms are indistinguishable. The proposed non-image compression algorith is a Lempel-Ziv-Welch (LZW) variant, which is a lossless universal compression algorithm based on a dynamic dictionary lookup table. We developed a simple and efficient hashing function to perform the string search. Author

This is a fault-tolerant random access memory for use in fault-tolerant computers. It comprises a plurality of memory chips each comprising a plurality of on-line testable and correctable memory cells disposed in rows and columns for holding individually addressable binary bits and provision for error detection incorporated into each memory cell for outputting an error signal whenever a transient error occurs therein. In one embodiment, each of the memory cells comprises a pair of static memory sub-cells for simultaneously receiving and holding a common binary data bit written to the memory cell and the error detection provision comprises comparator logic for continuously sensing and comparing the contents of the memory sub-cells to one another and for outputting the error signal whenever the contents do not match. In another embodiment, each of the memory cells comprises a static memory sub-cell and a dynamic memory sub-cell for simultaneously receiving and holding a common binary data bit written to the memory cell and the error detection provision comprises comparator logic for continuously sensing and comparing the contents of the static memory sub-cell to the dynamic memory sub-cell and for outputting the error signal whenever the contents do not match. Capability for correction of errors is also included.

Field Programmable Gate Arrays commonly called FPGA's are the newer generation of field programmable devices and offer more flexibility in the logic modules they incorporate and in how they are interconnected. The flexibility, the number of logic building blocks available, and the high gate densities achievable are why users find FPGA's attractive. These attributes are important in reducing product development costs and shortening the development cycle. The aerospace community is interested in incorporating this new generation of field programmable technology in space applications. To this end, a consortium was formed to evaluate the quality, reliability, and radiation performance of FPGA's. This report presents the test results on FPGA parts provided by ACTEL Corporation. AUTOMATED TOOLS FOR TESTING COMPUTER SYSTEM VULNERABILITY
W. Timothy Polk Dec. 1992 42 p
(PB93-146025; NIST/SP-800/6) Avail: CASI HC A03/MF A01; SOD HC

The document discusses automated tools for testing computer system vulnerability. By analyzing factors affecting the security of a computer system, a system manager can identify common vulnerabilities stemming from administrative errors. Using automated tools, this process may examine the content and protections of hundreds of files on a multi-user system and identify subtle vulnerabilities. By acting on this information, system administrators can significantly reduce their systems' security exposure. Automated vulnerability testing tools are available for a wide variety of systems. Some tools are commercially available; others are available from other system administrators. Additional tools may be developed to address specific concerns for an organization's computer systems. The document examines basic requirements for vulnerability testing tools and describes the different functional classes of tools. Finally, the document offers general recommendations about the selection and distribution of such tools. GRA

The popular QR algorithm for solving all eigenvalues of an unsymmetric matrix is reviewed. Among the basic components in the QR algorithm, it was concluded from this study, that the reduction of an unsymmetric matrix to a Hessenberg form (before applying the QR algorithm itself) can be done effectively by exploiting the vector speed and multiple processors offered by modern high-performance computers. Numerical examples of several test cases have indicated that the proposed parallel-vector algorithm for converting a given unsymmetric matrix to a Hessenberg form offers computational advantages over the existing algorithm. The time saving obtained by the proposed methods is increased as the problem size increased. Author (revised)

HYPERSTRUCTURES AS COMPUTER ARCHITECTURES FOR HIGH PERFORMANCE MULTIPROCESSOR SYSTEMS Ph.D. Thesis
S. Boucouris Ottawa, Ontario Carleton Univ. 25 Sep. 1989 136 p
(ISBN-0-315-58975-2; CTN-93-60651) Copyright Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada, HC

A theoretical framework is presented, along with a set of closed form expressions, for the evaluation of hypercube-like computer architectures (hyperstructures). The evaluation criteria include the diameter, average message path length, average message density, and fault tolerance. It is demonstrated that almost all configurations proposed in the literature are analyzable as special cases of the proposed scheme. A number of containment and partitioning properties of the binary hypercube are generalized to a large class of hypercube derivatives. In addition, the very large scale integration implementation of hyperstructures is considered. Algorithms are presented that make possible the generation of near-optimal layouts for any hypercube derivative. Results are presented that match or exceed the performance of configuration specific algorithms previously reported. The reduction of interconnection cost of a hyperstructure is also addressed. An approach is presented that makes possible the reduction of the interconnection cost in a controlled fashion. Author (CISTI)

VLSI ARCHITECTURAL SYNTHESIS FOR DSP CUSTOM APPLICATIONS Ph.D. Thesis
Baher S. Haroun Waterloo, Ontario Univ. of Waterloo 1989 204 p
(ISBN-0-315-57793-2; CTN-93-60657) Copyright Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada, HC

A novel design methodology is presented for automated mapping of digital signal processing (DSP) algorithms into very large scale integration (VLSI) architectures. The methodology takes into account explicit algorithm requirements on throughput and latency, in addition to VLSI technology constraints on silicon area and power dissipation. Algorithm structure, design style of functional units and parallelism of the architecture are all explored in the design space. Algorithm structural transformations necessary to obtain high throughputs are developed. The synthesized architecture is a multiple bus, multiple functional unit processor matched to the implemented algorithm. The architecture is obtained by optimal or suboptimal graph theoretic transformations from an initial general architecture. The architecture has a linear topology and uses a lower number of interconnects and multiplexer inputs and has efficient data storage compared to other synthesized architectures with random topology having the same performance. The synthesized processor is a self-timed element externally while it is internally synchronous, suitable for multiprocessor implementations. The methodology is implemented in a design aid tool called SPAID. Results obtained using SPAID on different DSP algorithms compare favorably with other synthesis techniques. Author (CISTI)

This report is an attempt to clarify some of the concerns raised about the OMT method, specifically that OMT is weaker than the Booch method in a few key areas. This interim report specifically addresses the following issues: (1) is OMT object-oriented or only data-driven?; (2) can OMT be used as a front-end to implementation in C++?; (3) the inheritance concept in OMT is in contradiction with the 'pure and real' inheritance concept found in object-oriented (OO) design; (4) low support for software life-cycle issues, for project and risk management; (5) uselessness of functional modeling for the ROSE project; and (6) problems with event-driven and simulation systems. The conclusion of this report is that both Booch's method and Rumbaugh's method are good OO methods, each with strengths and weaknesses in different areas of the development process.

LOS ALAMOS HPDS: HIGH-SPEED DATA TRANSFER
M. W. Collins, J. Brewton, D. Cook, L. Jones, K. Kelly, D. L. Kluegel, D. Krantz, and C. Ramsey 1992 9 p Presented at the 12th IEEE Symposium on Mass Storage Systems, Monterey, CA, 25-29 Apr. 1992
(Contract W-7405-eng-36)
(DE93-003804; LA-UR-92-3600; CONF-9204217-1) Avail: CASI HC A02/MF A01

The Los Alamos High-Performance Data System (HPDS) is being developed to meet data storage and data access requirements of Grand Challenge and National Security problems running in a high-performance computing environment. HPDS is a new-generation data storage system in which storage devices are directly connected to a network, data is transferred directly between client machines and storage devices, and software distributed on workstations provides system management and control capabilities. Essential to the success of HPDS will be the ability to effectively use high performance parallel interface (HIPPI) networks and HIPPI-attached storage devices for high-speed data transfer. The peer-to-peer data transfer protocol that was developed for HPDS is addressed and the HPDS implementation approach is described. Because HPDS is under development, many changes will have taken place between the time this paper was written in October 1992 and its presentation in April 1993.

THE DESIGN OF SCALABLE SOFTWARE LIBRARIES FOR DISTRIBUTED MEMORY CONCURRENT COMPUTERS
Jaeyoung Choi, D. W. Walker, and J. J. Dongarra 1992 14 p Presented at the CNRS-NSF Collaboration Workshop on Environments and Tools for Parallel Scientific Computing, St. Hilaire du Touvet, France, 7-8 Sep. 1992
(Contract DE-AC05-84OR-21400)
(DE93-003612; CONF-9209274-1) Avail: CASI HC A03/MF A01

This paper describes the design of ScaLAPACK, a scalable software library for performing dense and banded linear algebra computations on distributed memory concurrent computers. The specification of the data distribution has important consequences for interprocessor communication and load balance, and hence is a major factor in determining performance and scalability of the library routines. The block scattered data distribution is adopted as a simple, yet general-purpose, way of decomposing block-partitioned matrices. Distributed memory versions of the Level 3 BLAS provide an easy and convenient way of implementing the ScaLAPACK routines. Performance and scalability results for the ScaLAPACK LU factorization routine are presented, and potential uses for ScaLAPACK are discussed.

Field studies were conducted by MCC to determine areas of research of mutual interest to MCC and JSC. NASA personnel from the Information Systems Directorate and research faculty from UHCL/RICIS visited MCC in Austin, Texas to examine tools and applications under development in the MCC Software Technology Program. MCC personnel presented workshops in hypermedia, design knowledge capture, and design recovery on site at JSC for ISD personnel. The following programs were installed on workstations in the Software Technology Lab, NASA/JSC: (1) GERM (Graphic Entity Relations Modeler); (2) gIBIS (Graphic Issues Based Information System); and (3) DESIRE (Design Recovery tool). These applications were made available to NASA for inspection and evaluation.

Programs developed in the MCC Software Technology Program run on the SUN workstation. The programs do not require special configuration, but they will require larger than usual amounts of disk space and RAM to operate properly. Derived from text

Werner Fischer Jun. 1990 53 p In GERMAN Presented at PPS, Wandel, Germany, 26-27 Jun. 1990

(MBB-FW-3-S-PUB-0439-A; ETN-93-93440) Avail: CASI HC A04/MF A01

It is shown that the utilization of technical products takes place by fluxes and processes which are similar to biological processes, in connection with information, energy, and material. Avionics and Computer Integrated Manufacturing (CIM) are the most important application fields. The three domains, product internal, product near, and product neutral information processing, used very different processes. Great rationalization and quality improvements are still expected for Computer Aided Software Engineering (CASE). The consequences of integrated information processing are reported. It is concluded that companies have to solve more or less integration tasks, according to the product complexity and the operating cycles. ESA

POSITION CALIBRATION SOFTWARE FOR THE FORM ASSESSMENT OF COMPLEX WORKPIECES

A. B. Forbes Jul. 1992 16 p

(NPL-DITC-203/92; ETN-93-93545) Copyright Avail: National Physical Lab., Teddington, Middlesex, TW11 0LW, England

The use of a measurement strategy and position calibration software to overcome the difficulty in measuring many manufactured workpieces by a Coordinate Measuring Machine (CMM) is described. The difficulty arises because for any given orientation of the workpiece some of the important areas cannot be accessed by the CMM's probe. Three or more reference spheres are rigidly attached to the workpiece. Sets of measurements of the workpiece and the spheres are collected with the workpiece at locations and orientation convenient for measurement. The software tracks the changes in position by determining the frame of reference defined by the reference spheres at each stage and then combines the different sets of measurements to yield a composite data set from which an accurate assessment of the complete workpiece can be made. The method, which can be applied to a wide range of artefacts with minimal addition effort, is largely self calibrating which makes the measurements process straightforward. The software is self starting which makes it very simple to use. ESA

CREEPSIM-2: A SOFTWARE PACKAGE FOR NUMERICAL INTEGRATION OF 1ST ORDER DIFFERENTIAL EQUATIONS

S. Osgerby, A. Barbosa, and B. F. Dyson Jun. 1992 20 p Sponsored by Dept. of Trade and Industry

(NPL-DMM(A)-35; ETN-93-93547) Copyright Avail: National Physical Lab., Teddington, Middlesex, TW11 0LW, England

The time dependent deformation and consequent fracture behavior of engineering materials under variable load and temperature can be modeled using a set of first order differential equations based upon state viables which are defined to represent the physical mechanisms of deformation and fracture. Usually, these equation sets cannot be solved analytically and a method of numerical integration is required. A software package, designated CREEPSIM-2, was developed to perform this task, which overcomes many limitations of an earlier program, CREEPSIM. The use of the program is described and examples of the screen display are given. Examples of the use of the package to model a number of different deformation and fracture mechanisms are given to illustrate the versatility of the modeling approach. ESA

PLTPWR: A VERSATILE TOOL FOR GREYSCALE AND POWER SPECTRAL DISPLAY

Joseph B. Farrell Apr. 1992 78 p

(DREA-TC-92-306; CTN-93-60711) Avail: CASI HC A05/MF A01

The versatile plotting program PLTPWR is described. The program is designed to display both real and complex format power spectrum files and runs on Concurrent Computer Corporation 5000-6000 series and Digital Equipment VAX computers. PLTPWR has a powerful user interface which provides versatility in setting up parameters for calibration, display, and printing of power spectra. Some of the main features of PLTPWR are: a fully configurable display of power spectra, cross-power spectra, 1/3 octave spectra, coherence, and bearing data from Defence Research Establishment Atlantic (DREA) format files; re-display and printing of information contained in DREA format greyscale files; hardcopy output in postscript format of any displayed data; fully configurable greyscale calculations from input power spectrum files; up to 16 on-screen color displays of greyscale and/or spectral data (Concurrent 5000-6000 series only); hardcopy output from any computed greyscale data; and calibration, time averaging, and bin compression of power spectrum data. The program user interface and commands are explained, file formats are described, and procedures are given for configuring on-screen greyscale displays and implementing the program. Author (CISTI)

A NASA-WIDE APPROACH TOWARD COST-EFFECTIVE, HIGH-QUALITY SOFTWARE THROUGH REUSE

Charlotte O. Scheper, ed. (Research Triangle Inst., Research Triangle Park, NC.) and Kathryn A. Smith, ed. Jan. 1993 125 p Proceedings of the Second NASA Workshop on Software Reuse held at Research Triangle Park, NC, 5-6 May 1992

(RTOP 505-64-10-02)

(NASA-CP-10115; NAS 1.55:10115) Avail: CASI HC A06/MF A02

NASA Langley Research Center sponsored the second Workshop on NASA Research in Software Reuse on May 5-6, 1992 at the Research Triangle Park, North Carolina. The workshop was hosted by the Research

Triangle Institute. Participants came from the three NASA centers, four NASA contractor companies, two research institutes and the Air Force's Rome Laboratory. The purpose of the workshop was to exchange information on software reuse tool development, particularly with respect to tool needs, requirements, and effectiveness. The participants presented the software reuse activities and tools being developed and used by their individual centers and programs. These programs address a wide range of reuse issues. The group also developed a mission and goals for software reuse within NASA. This publication summarizes the presentations and the issues discussed during the workshop. Author

CONJUNCTIVE PROGRAMMING: AN INTERACTIVE APPROACH TO SOFTWARE SYSTEM SYNTHESIS
Robert C. Tausworthe 1 Aug. 1992 136 p
(Contract NAS7-918)
(NASA-CR-192798; NAS 1.26:192798; JPL-Publ-92-12) Avail: CASI HC A07/MF A02

This report introduces a technique of software documentation called conjunctive programming and discusses its role in the development and maintenance of software systems. The report also describes the conjoin tool, an adjunct to assist practitioners. Aimed at supporting software reuse while conforming with conventional development practices, conjunctive programming is defined as the extraction, integration, and embellishment of pertinent information obtained directly from an existing database of software artifacts, such as specifications, source code, configuration data, link-edit scripts, utility files, and other relevant information, into a product that achieves desired levels of detail, content, and production quality. Conjunctive programs typically include automatically generated tables of contents, indexes, cross references, bibliographic citations, tables, and figures (including graphics and illustrations). This report presents an example of conjunctive programming by documenting the use and implementation of the conjoin program. Author (revised)

SOFTWARE ENGINEERING: WHAT DO EXPERIMENTS NEED?
S. C. Loken Sep. 1992 4 p Presented at the 10th Conference on Computing in High Energy Physics, Annecy, France, 21-25 Sep. 1992
(Contract DE-AC03-76SF-00098)
(DE93-004767; LBL-32937; CONF-920966-23) Avail: CASI HC A01/MF A01

This paper will review the use of software engineering in High Energy Physics experiments and will suggest ways in which that use will change significantly in the future. In principle, experiments do not need software engineering. We can verify this by looking at a long series of experiments that have succeeded without it. Some experiments that have tried to apply formal engineering methods have given them up before the software was complete. Future experiments, however, face many new challenges in the larger data samples, larger and more distributed collaborations, and longer time scales. In addition, new tools are available to aid in the development of complex software systems. It is appropriate, therefore, to examine whether there is now a better match between software engineering and the needs of experiments. DOE

HIGH SPEED, WIDE AREA DISTRIBUTED COMPUTING FOR SCIENTIFIC IMAGING
W. E. Johnston, V. L. Jacobson, S. C. Loken, D. W. Robertson, and B. L. Tierney Sep. 1992 4 p Presented at the 10th Conference on Computing in High Energy Physics, Annecy, France, 21-25 Sep. 1992
(Contract DE-AC03-76SF-00098)
(DE93-004727; LBL-32935; CONF-920966-22) Avail: CASI HC A01/MF A01

A scenario for a fully distributed computing environment in which computing, storage, and I/O elements are configured on demand into 'virtual systems' that are optimal for the solution of a particular problem is presented. An experiment that illustrates some of the elements and issues of this scenario is also presented. The goal is to make the most powerful computing systems those that are logically assembled from network based components, and to make those systems available independent of the geographic location of the constituent elements. UPDATE OF GRASP/Ada REVERSE ENGINEERING TOOLS FOR Ada Final Report, 1 Jul. - 31 Dec. 1992
James H. Cross, II 31 Dec. 1992 54 p
(Contract NAS8-39131)
(NASA-CR-192465; NAS 1.26:192465; CSE-92-10) Avail: CASI HC A04/MF A01

The GRASP/Ada project (Graphical Representations of Algorithms, Structures, and Processes for Ada) has successfully created and prototyped a new algorithmic level graphical representation of Ada software, the Control Structure Diagram (CSD). The primary impetus for creation of the CSD was to improve the comprehension efficiency of Ada software and, as a result, improve reliability and reduce costs. The emphasis was on the automatic generation of the CSD from Ada PDL or source code to support reverse engineering and maintenance. The CSD has the potential to replace traditional prettyprinted Ada source code. In Phase 1 of the GRASP/Ada project, the CSD graphical constructs were created and applied manually to several small Ada programs. A prototype (Version 1) was designed and implemented using FLEX and BISON running under VMS on a VAS 11-780. In Phase 2, the prototype was improved and ported to the Sun 4 platform under UNIX. A user interface was designed and partially implemented using the HP widget toolkit and the X Windows System. In Phase 3, the user interface was extensively reworked using the Athena widget toolkit and X Windows. The prototype was applied successfully to numerous Ada programs ranging in size from several hundred to several thousand lines of source code. Following Phase 3, the prototype was evaluated by software engineering students at Auburn University and then updated with significant enhancements to the user interface including editing capabilities. Version 3.2 of the prototype was prepared for limited distribution to facilitate further evaluation. The current prototype provides the capability for the user to generate CSD's from Ada PDL or source code in a reverse engineering as well as forward engineering mode with a level of flexibility suitable for practical application. A COMPARATIVE STUDY OF PRECONDITIONED LANCZOS METHODS FOR NONSYMMETRIC LINEAR SYSTEM
C. H. Tong Sep. 1992 121 p
(Contract DE-AC04-76DR-00789)
(DE93-006453; SAND-91-8240B) Avail: CASI HC A06/MF A02

Many important scientific applications require the solution of very large and sparse nonsymmetric linear systems. Hence, there has been great interest in the development of robust and efficient solvers. In recent years, the class of Krylov subspace methods has emerged as the most popular iterative solution schemes. Coupled with effective preconditioning, these

methods show fast convergence for many problems. However, these methods are not guaranteed to converge, especially for many difficult problems that are strongly nonsymmetric, near singular, and indefinite. In this report, we survey some recent developments of Krylov subspace methods which are based on the Lanczos procedure. These methods have been implemented and tested on a variety of problems. Extensive numerical results are presented and discussed. DOE

ISOMORPHIC ROUTING ON A TOROIDAL MESH Final Report
Weizhen Mao and David M. Nicol Washington Feb. 1993 25 p Submitted for publication Sponsored by NASA. Langley Research Center
(Contracts NAS1-19480; NAS1-18605; RTOP 505-90-52-01)
(NASA-CR-191430; NAS 1.26:191430; ICASE-93-5) Avail: CASI HC A03/MF A01

We study a routing problem that arises on SIMD parallel architectures whose communication network forms a toroidal mesh. We assume there exists a set of k message descriptors (xi, yi), where (xi, yi) indicates that the ith message's recipient is offset from its sender by xi hops in one mesh dimension, and yi hops in the other. Every processor has k messages to send, and all processors use the same set of message routing descriptors. The SIMD constraint implies that at any routing step, every processor is actively routing messages with the same descriptors as any other processor. We call this isomorphic routing. Our objective is to find the isomorphic routing schedule with least makespan. We consider a number of variations on the problem, yielding complexity results from O(k) to NP-complete. Most of our results follow after we transform the problem into a scheduling problem, where it is related to other well-known scheduling problems. Author

VASGEN: A FINITE ELEMENT MODEL GENERATION PROGRAM FOR VAST. USER'S MANUAL, VERSION 4.0
E. J. Crocker and M. W. Chernuka May 1991 212 p
(Contract DSS-W7707-8-0145)
(DREA-CR-91-447) Avail: Issuing Activity (Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada)

A program called VASGEN for generating finite element models through the use of parametric cubic modelling based on cubic curves, Coons patches and tri-cubic hyperpatches is presented. The program is designed to produce geometry and element connectivity data for use by the finite element analysis program VAST. It provides capabilities for mesh generation, the linking of discrete meshed curves, patches and hyperpatches, and bandwidth h minimization. The program graphics facilities allow the user to plot both the geometric model and the finite element model. Notable enhancements within version 4.0 of VASGEN include modelling using parametric cubic splines; generation of patch intersection curves; generation of degenerate entities; meshing with axisymmetric elements; and grid biasing toward entity boundaries and/or stiffener locations. Modelling recommendations and example models generated with VASGEN are provided. Author

PROCEEDINGS: DOD SOFTWARE TECHNOLOGY STRATEGY PUBLIC FORUM
2 Apr. 1992 292 p Proceedings held in Falls Church, VA, 31 Mar. - 2 Apr. 1992
Avail: CASI HC A13/MF A03

DoD Software Technology Strategy (SWTS) Forum succeeded in its primary objectives to: obtain feedback which will help to improve the SWTS and refine a shared vision of DoD's software technology future. The Forum was preceded by the distribution of a draft SWTS document in January 1992. Reviewers were requested to provide initial comments on the draft. The SWTS working group received over 450 comments, and used these comments to help structure the Forum presentations and issue discussions. These Proceedings provide a record of the Forum activity. Topics covered include: software technology strategy; software and systems engineering; human-computer interactions; artificial intelligence and intelligent systems; parallel/distributed software; fault tolerance software; and high assurance software. SUBOPTIMUM DECODING OF BLOCK CODES
Shu Lin and Tadao Kasami (Osaka Univ., Toyonaka, Japan.) 15 Oct. 1991 14 p
(Grant NAG5-931)
(NASA-CR-192342; NAS 1.26:192342; NASA-91-004) Avail: CASI HC A03/MF A01

This paper investigates a class of decomposable codes, their distance and structural properties. it is shown that this class includes several classes of well known and efficient codes as subclasses. Several methods for constructing decomposable codes or decomposing codes are presented. A two-stage soft decision decoding scheme for decomposable codes, their translates or unions of translates is devised. This two-stage soft-decision decoding is suboptimum, and provides an excellent trade-off between the error performance and decoding complexity for codes of moderate and long block length. Author

ADVANCED COMMUNICATIONS TECHNOLOGY SATELLITE HIGH BURST RATE LINK EVALUATION TERMINAL COMMUNICATION PROTOCOL SOFTWARE USER'S GUIDE, VERSION 1.0 Final Report
Richard C. Reinhart Mar. 1993 48 p
(Contract NAS3-25776; RTOP 679-50-0A)
(NASA-CR-189162; E-7657; NAS 1.26:189162) Avail: CASI HC A03/MF A01

The Communication Protocol Software was developed at the NASA Lewis Research Center to support the Advanced Communications Technology Satellite High Burst Rate Link Evaluation Terminal (ACTS HBR-LET). The HBR-LET is an experimenters terminal to communicate with the ACTS for various experiments by government, university, and industry agencies. The Communication Protocol Software is one segment of the Control and Performance Monitor (C&PM) Software system of the HBR-LET. The Communication Protocol Software allows users to control and configure the Intermediate Frequency Switch Matrix (IFSM) on board the ACTS to yield a desired path through the spacecraft payload. Besides IFSM control, the C&PM Software System is also responsible for instrument control during HBR-LET experiments, uplink power control of the HBR-LET to demonstrate power augmentation during signal fade events, and data

display. The Communication Protocol Software User's Guide, Version 1.0 (NASA CR-189162) outlines the commands and procedures to install and operate the Communication Protocol Software. Configuration files used to control the IFSM, operator commands, and error recovery procedures are discussed. The Communication Protocol Software Maintenance Manual, Version 1.0 (NASA CR-189163, to be published) is a programmer's guide to the Communication Protocol Software. This manual details the current implementation of the software from a technical perspective. Included is an overview of the Communication Protocol Software, computer algorithms, format representations, and computer hardware configuration. The Communication Protocol Software Test Plan (NASA CR-189164, to be published) provides a step-by-step procedure to verify the operation of the software. Included in the Test Plan is command transmission, telemetry reception, error detection, and error recovery procedures. Author (revised)

The Parallel Diagonal Dominant (PDD) algorithm is a highly efficient, ideally scalable tridiagonal solver. In this paper, a detailed study of the PDD algorithm is given. First the PDD algorithm is introduced. Then the algorithm is extended to solve periodic tridiagonal systems. A variant, the reduced PDD algorithm, is also 'proposed. Accuracy analysis is provided for a class of tridiagonal systems, the symmetric, and anti-symmetric Toeplitz tridiagonal systems. Implementation results show that the analysis gives a good bound on the relative error, and the algorithm is a good candidate for the emerging massively parallel machines. Author

MODELING AND ANALYSIS OF SOFTWARE RELIABILITY Ph.D. Thesis
Nalina Suresh 1992 108 p
Avail: Univ. Microfilms Order No. DA9235086

This dissertation investigates the modeling of software reliability and its application to software development process. First, an extension of a Bayes empirical-Bayes model for software reliability is considered by assuming time between failures to be Weibull random variables. Then a software reliability growth model based on a nonhomogeneous Poisson process with Weibull intensity function is introduced. An Unbiased estimate of failure rate is used for reliability prediction. This result is compared with predictions by models which fit into the general framework of Bayes Empirical-Bayes problem. the model which assumes that time between failures has an exponential distribution and the model which assumes the process generating failures to be nonhomogeneous Poisson process with special type of intensity function have been used for comparison. An extension of Nonhomogeneous Poisson Process is derived. This extension considers the intensity function as a function of time, number of errors removed, and the time since the last failure. To illustrate the usefulness of above extension and optimization model for software development process is formulated. This model determines the optimal allocation of resources throughout the development that maximizes the reliability of the software for a given cost. Then a linear programming model is formulated to maximize the quality of the software within the budget. Some possible extensions are mentioned. Dissert. Abstr.

Weighted least squares (WLS) and adaptive weighted least squares (AWLS) algorithms are initiated for continuous-time system identification using Fourier type modulating function techniques. Two stochastic signal models are examined using the mean square properties of the stochastic calculus: an equation error signal model with white noise residuals, and a more realistic white measurement noise signal model. The covariance matrices in each model are shown to be banded and sparse, and a joint likelihood cost function is developed which links the real and imaginary parts of the modulated quantities. The superior performance of above algorithms is demonstrated by comparing them with the LS/MFT and popular predicting error method (PEM) through 200 Monte Carlo simulations. A model reduction problem is formulated with the AWLS/MFT algorithm, and comparisons are made via six examples with a variety of model reduction techniques, including the well-known balanced realization method. Here the AWLS/MFT algorithm manifests higher accuracy in almost all cases, and exhibits its unique flexibility and versatility. Armed with this model reduction, the AWLS/MFT algorithm is extended into MIMO transfer function system identification problems. The impact due to the discrepancy in bandwidths and gains among subsystem is explored through five examples. Finally, as a comprehensive application, the stability derivatives of the longitudinal and lateral dynamics of an F-18 aircraft are identified using physical flight data provided by NASA. A pole-constrained SIMO and MIMO AWLS/MFT algorithm is devised and analyzed. Monte Carlo simulations illustrate its high-noise rejecting properties. Utilizing the flight data, comparisons among different MFT algorithms are tabulated and the AWLS is found to be strongly favored in almost all facets. Author

REDUCING COMMUNICATION INEFFICIENCIES FOR A FLEXIBLE PROGRAMMING PARADIGM
M. Fischler, M. Gao, G. Hockney, M. Isely, and M. Uchima Nov. 1992 4 p Presented at the LATTICE 1992 Lattice Field Theory, Amsterdam, Netherlands, 15-19 Sep. 1992
(Contract DE-AC02-76CH-03000)
(DE93-005670; FNAL/C-92/324; CONF-9209276-8) Avail: CASI HC A01/MF A01

The ACPMAPS system at Fermilab has been upgraded to 50 GF by inserting new CPU modules, based on the Intel i860. This ten-fold increase in power, utilizing the identical communications backbone, places the system in a different realm: The transfer latency and overheads are now greater, relative to the cost of a floating point operation. We explore the consequences for programs written using CANOPY, which relies on low communications latencies. We present techniques for alleviating the efficiency decrease, by coalescing transfers, without abandoning the considerable advantages of the CANOPY paradigm. DOE

SPRING2: HELICAL COMPRESSION SPRING GEOMETRY GENERATOR PROGRAM MANUAL
David C. Stredulinsky Jul. 1992 60 p
(DREA-TC-92-314; CTN-93-60714) Avail: CASI HC A04/MF A01

Documentation and operating instructions are provided for the FORTRAN computer program SPRING2. This code is used to generate the geometry of a helical compression spring with closed ground ends. The primary output of the code is a PATRAN session file which can be run in PATRAN to generate PATRAN Phase 1 (geometry) and Phase 2 (finite element) models automatically. A PATRAN neutral file is then created which the program PATVAS can convert to a VAST finite element model. The program can be used to generate a session file for a full solid finite element model, constructed with 20-noded hexahedral elements, or for a simplified line model in which the spring helix is modelled with a string of beam elements following the spring wire center line. BIPARTITIONING OF LOTOS SPECIFICATIONS M.S. Thesis

Peter J. Broekroelofs 1992 86 p

(Memo-INF-92-50; TIOS-92-22; ETN-93-9324) Copyright Avail: CASI HC A05/MF A01

Algorithms for the bipartitioning of Basic LOTOS specifications are developed. The main advantage of these algorithms is that they preserve structure, that is they do not expand the specification. The algorithms are implemented in a software tool, called CLEAVER. A designer makes a partitioning of observable and nonobservable gates of specification and the tool then automatically derives the target specification. An exercise shows the practical use of the bipartitioning algorithms and the tool. In this exercise a simple but fairly complete message transfer service is bipartitioned into a protocol. The service is written in the constraint oriented specification style, while the derived protocol is resource oriented. The resources in the protocol are structured in the constraint oriented style, as a result of the preserving of the service structure. With CLEAVER, the service can be bipartitioned in one step. Deriving protocols from services is one of the important uses of the bipartitioning method. Other applications are restructuring and modularization of a design and the derivation of Upper and Lower Testers for conformance testing. ESA

LARCRIM USER'S GUIDE, VERSION 1.0

John S. Davis and William J. Heaphy Jan. 1993 99 p

(Contract NAS1-19038; RTOP 505-90-53-02)

(NASA-CR-191416; NAS 1.26:191416; TAO-60306) Avail: CASI HC A05/MF A02

LARCRIM is a relational database management system (RDBMS) which performs the conventional duties of an RDBMS with the added feature that it can store attributes which consist of arrays or matrices. This makes it particularly valuable for scientific data management. It is accessible as a stand-alone system and through an application program interface. The stand-alone system may be executed in two modes: menu or command. The menu mode prompts the user for the input required to create, update, and/or query the database. The command mode requires the direct input of LARCRIM commands. Although LARCRIM is an update of an old database family, its performance on modern computers is quite satisfactory. LARCRIM is written in FORTRAN 77 and runs under the UNIX operating system. Versions have been released for the following computers: SUN (3 & 4), Convex, IRIS, Hewlett-Packard, CRAY 2 & Y-MP. Author

APPLICATIONS OF PARALLEL AND VECTOR ALGORITHMS IN NONLINEAR STRUCTURAL DYNAMICS USING THE FINITE ELEMENT METHOD Ph.D. Thesis, 1991

Brian E. Healy, David A. Pecknold, and Robert H. Dodds, Jr. Sep. 1992 317 p Sponsored in part by Illinois Dept. of Commerce and Community Affairs

(Contract DE-FG02-85ER-25001)

(PB93-142438; UILU-ENG-92-2011; Structural Research Ser-571) Avail: CASI HC A14/MF A03

The research is directed toward the numerical analysis of large, three dimensional, nonlinear dynamic problems in structural and solid mechanics. Such problems include those exhibiting large deformations, displacements, or rotations, those requiring finite strain plasticity material models that couple geometric and material nonlinearities, and those demanding detailed geometric modeling. A finite element code was developed, designed around the 3D isoparametric family of elements, using a Total Lagrangian formulation and implicit integration of the global equations of motion. The research was conducted using the Alliant FX/8 and Convex C240 supercomputers. The research focuses on four main areas: development of element computation algorithms that exploit the inherent opportunities for concurrency and vectorization present in the finite element method; comparison of the preconditioned conjugate gradient method to a representative direct solver; investigation of various nonlinear solution algorithms, such as modified Newton-Raphson, secant-Newton, and nonlinear preconditioned conjugate gradient; and discovery of an accurate, robust finite strain plasticity material model. TAMING CHAOTIC CIRCUITS Ph.D. Thesis

Elizabeth Bradley Sep. 1992 191 p

(Contract N00014-89-J-3202; NSF MIP-90-011651)

(AD-A259495; AI-TR-1388) Avail: CASI HC A09/MF A02

Control algorithms that exploit chaotic behavior and its precursors can vastly improve the performance of many practical and useful systems. Phase-locked loops, for example, are normally designed using linearization. This approximation hides the global dynamics that lead to lock and capture range limits. Design techniques that are equipped to exploit the real nonlinear and chaotic nature of the device can loosen these limitations. The program Perfect Moment is built around a collection of such techniques. Given a differential equation, a control parameter, and two state-space points, the program explores the system's behavior, automatically choosing interesting and useful parameter values and constructing state-space portraits at each one. It then chooses a set of trajectory segments from those portraits, uses them to construct a composite path between the objectives, and finally causes the system to follow that path by switching the parameter value at the segment junctions. Rules embodying theorems and definitions from nonlinear dynamics are used to limit computational complexity by identifying areas of interest and directing and focusing the mapping and search on these areas. Even so, these processes are computationally intensive. However, the sensitivity of a chaotic system's state-space topology to the parameters of its equations and the sensitivity of the paths of its trajectories to state perturbations make this approach rewarding in spite of its computational demands. A NEW PROCESS FOR ACQUIRING SOFTWARE ARCHITECTURE

Thomas F. Saunders, Barry M. Horowitz, and Matt L. Mleziva Nov. 1992 26 p

(AD-A259487; M-92B0000126) Avail: CASI HC A03/MF A01

Military systems must be able to change to accommodate new mission needs, threats, and technology. At the same time, military systems are being developed with budgets that are more and more limited. It is necessary to find ways to keep costs down and to maximize adaptability - for new systems and for extensions to existing systems that must be preserved. A system's software architecture is a key determinant of the system's adaptability. A well-conceived and well-maintained architecture allows reusable components to be included in the original development, custom components to be smoothly integrated via standard interface protocols, and improved components to be incorporated as replacements or enhancements are needed. To be useful, the software architecture must first be articulated and include provisions for change; second, it must be controlled and maintained throughout the system's life cycle. A process that can be used to ensure that system acquisitions include attention to the software architecture is defined. Author (revised)

A FUZZY LOGIC CONTROLLER SYSTEM Final Report, period ending Feb. 1992

G. P. Bradford Nov. 1992 58 p

(AD-A259723; AD-E951943, :; AMSMI/TR-RD-GC-92-26) Avail: CASI HC A04/MF A01

Fuzzy set theory allows for a relatively straightforward method of working with uncertain or imprecise data. Fuzzy logic makes use of this theory by providing a methodology of applying rules to this data. A short discussion of fuzzy set theory followed by a discussion of the system simulated is presented. A simple feedback system is used to illustrate the application of fuzzy logic. The system simulated is a simplified model of a turret whose position is to be controlled. The results of the simulation are shown and elaborated on, followed by a discussion of potential applications for fuzzy controllers and expert systems. As an appendix, the computer source code used to implement the simulation is presented and discussed. GRA

TOWARDS A VISION ALGORITHM COMPILER FOR RECOGNITION OF PARTIALLY OCCLUDED 3-D OBJECTS

Mark D. Wheeler and Katsushi Ikeuchi 20 Nov. 1992 56 p

(Contract F33615-90-C-1465; ARPA Order 7597)

(AD-A259711; CMU-CS-92-185) Avail: CASI HC A04/MF A01

Our goal is to develop a model-based vision system that is capable of recognizing 3-D objects in range images in spite of partial occlusion of the objects. We present new methods for object recognition and localization and describe the implementation and performance of these methods in our Vision Algorithm Compiler (VAC) model-based vision system. The VAC is given a sensor model and a set of geometric object models and generates a recognition/localization program for the specified objects in images from the specified sensor. Our recognition algorithm is based on the hypothesize-and-verify paradigm. We use the sensor-modeling approach to build accurate models of our prior-knowledge constraints that account for constraints due to sensor characteristics feature-extraction algorithm behavior, model geometry, and the effects of partial occlusion. We phrase the hypothesis-generation process as a search for the most likely set of hypotheses based on our prior knowledge--in contrast to typical constrained combinatorial searches. GRA

THE ECA CRITICAL REQUIREMENTS MODEL Final Report

Charles N. Payne, Jr., David M. Mihelcic, Andrew P. Moore, and Kenneth J. Hayman 28 Dec. 1992 12 p

(AD-A259682; NRL/FR/5542-92-9528) Avail: CASI HC A03/MF A01

The ECA is an embedded computing device that processes message traffic for a network that must enforce end-to-end user message confidentiality. The ECA uses a commercial, off-the-shelf cryptographic device to transform sensitive data from the Red Domain of the network so that it can be transmitted over the untrusted communication links of the Black Domain. For transmission purposes, certain parts of a message, namely the message header, must be bypassed around the cryptographic device. The primary critical requirement for the ECA, Restricted Red-to-Black Flow (RRTBF), requires that the bypassed portion of each message must satisfy certain format restrictions, and that the rate of bypass must be constrained. In this report, we present an informal model of the ECA's critical requirements together with the assumptions under which the model was constructed. We then formalize this model by using the CSP Trace Model of computation. GRA

SUPPORT MEASUREMENT AND ESTIMATING FOR ORACLE DATABASE APPLICATIONS USING MARK 2 FUNCTION POINTS M.S. Thesis

Steven D. Radnov Dec. 1992 150 p

(AD-A259686; AFIT/GSS/LSY/92D-4) Avail: CASI HC A07/MF A02

This study investigated the results of measuring software support of Oracle database applications and estimating the effort and schedule required to provide support. Software measurement was accomplished with a variant of the function points metric, called Mark 2 function points, which is comprised of three weighted parameters, inputs, entities, and outputs. A technique for mapping Mark H function points to Oracle DBMS components was developed, and the size of the software support for each project, per team, was measured by tabulating and weighting the number of inputs, entities, and outputs that are added, changed, and/or deleted. Software support effort was measured in work-hours and scheduled in calendar-weeks for given levels of function points. A data collection program was written to assist with tabulating the measurements and also provided an option for sizing the support by analogy. Observations were collected for 12 projects ranging up to 50 function points. The relationship between software support measurement in Mark 2 function points and the effort or schedule was extensively analyzed for one and two person teams. A relationship determined by regression analysis was shown to be statistically significant for both effort and schedule. GRA

PLANNING MULTIPLE OBSERVATIONS FOR OBJECT RECOGNITION

Keith D. Gremban and Katsushi Ikeuchi 9 Dec. 1992 43 p

(Contract F33615-90-C-1465; ARPA Order 7597)

(AD-A259879; CMU-CS-92-146) Avail: CASI HC A03/MF A01

Most computer vision systems perform object recognition on the basis of the features extracted from a single image of the object. The problem with this approach is that it implicitly assumes that the available features are sufficient to determine the identity and pose of the object uniquely. If this assumption is not met, then the feature set is insufficient, and ambiguity results. Consequently, much research in computer vision has gone towards finding sets of features that are sufficient for specific tasks, with the result that each system has its own associated set of features. A single, general feature set would be desirable. However, research in automatic generation

of object recognition programs has demonstrated that pre-determined, fixed feature sets are often incapable of providing enough information to unambiguously determine object identity and pose. One approach to overcoming the inadequacy of any feature set is to utilize multiple sensor observations obtained from different viewpoints, and combine them with knowledge of the 3D structure of the object to perform unambiguous object recognition. Initial results towards performing object recognition using multiple observations to resolve ambiguities are presented. Starting from the premise that sensor motions should be planned out in advance, the difficulties involved in planning with ambiguous information are discussed. A representation for planning that combines geometric information with viewpoint uncertainty is presented. A sensor planner utilizing the representation was implemented, and the results of object recognition experiments performed with the planner are discussed. GRA

REPRESENTATION AND RECOGNITION OF FREE-FORM SURFACES

Herve Delingette, Martial Hebert, and Katsushi Ikeuchi Nov. 1992 43 p

(Contracts F33615-87-C-1499; DACA76-89-C-0014)

(AD-A259883; CMU-CS-92-214) Avail: CASI HC A03/MF A01

A new surface representation for recognizing curved objects is introduced. Our approach begins by representing an object by a discrete mesh of points built from range data or from a geometric model of the object. The mesh is computed from the data by deforming a standard shaped mesh, for example, an ellipsoid, until it fits the surface of the object. Local regularity constraints are defined that the mesh must satisfy. Then a canonical mapping between the mesh describing the object and a standard spherical mesh is defined. A surface curvature index that is pose-invariant is stored at every node of the mesh. This object representation is used for recognition by comparing the spherical model of a reference object with the model extracted from a new observed scene. It is shown how the similarity between reference model and observed data can be evaluated and it is shown how the pose of the reference object in the observed scene can be easily computed using this representation. Results are presented on real range images which show that this approach to modeling and recognizing three-dimensional objects has three main advantages: (1) it is applicable to complex curved surfaces that cannot be handled by conventional techniques; (2) it reduces the recognition problem to the computation of similarity between spherical distributions; in particular, the recognition algorithm does not require any combinatorial search; and (3) even though it is based on a spherical mapping, the approach can handle occlusions and partial views. AUTOMATED PROGRAM RECOGNITION BY GRAPH PARSING

Linda M. Wills Jul. 1992 337 p

(Contract N00014-88-K-0487)

(AD-A259609; AI-TR-1358) Avail: CASI HC A15/MF A03

The recognition of standard computational structures (cliches) in a program can help an experienced programmer understand the program. Based on the known relationships between the cliches, a hierarchical description of the program's design can be recovered. A graph parsing approach to automating program recognition in which programs are represented as attributed dataflow graphs is developed and studied and a library of cliches is encoded as an attributed graph grammar. Graph parsing is used to recognize cliche's in the code. It is demonstrated that this graph parsing approach is a feasible and useful way to automate program recognition. In studying this approach, two medium-sized, real-world simulator programs were experimented with. There are three aspects of the study. First, the representation's ability to suppress many common forms of program variation which hinder recognition is evaluated. Second, the expressiveness of the graph grammar formalism for capturing programming cliches is investigated. Third, the computational cost of our recognition approach with respect to the real-world simulator programs are empirically and analytically studied. GRA

PROGRESSIVE RETRY FOR SOFTWARE ERROR RECOVERY IN DISTRIBUTED SYSTEMS
Yi-Min Wang, Yennun Huang, and W. K. Fuchs 1993 19 p
(Contract N00014-91-J-1283)
(AD-A260075) Avail: CASI HC A03/MF A01

In this paper, we describe a method of execution retry for bypassing software errors based on checkpointing, rollback, message reordering and replaying. We demonstrate how rollback techniques, previously developed for transient hardware failure recovery, can also be used to recover from software faults by exploiting message reordering to bypass software errors. Our approach intentionally increases the degree of nondeterminism and the scope of rollback when a previous retry fails. Examples from our experience with telecommunications software systems illustrate the benefits of the scheme. GRA

INTEGRATED FLEXIBLE MANUFACTURING PROGRAM FOR MANUFACTURING AUTOMATION AND RAPID PROTOTYPING
S. L. Brooks, C. W. Brown, M. S. King, W. R. Simmons, and J. J. Zimmerman 1 Dec. 1992 9 p Presented at the National Aeronautics and Space Administration (NASA) Technology 2002 Conference, Baltimore, MD, 1-3 Dec. 1992
(Contract DE-AC04-76DP-00613)
(DE93-006722; KCP-613-5099; CONF-921230-3) Avail: CASI HC A02/MF A01

The Kansas City Division of Allied Signal Inc., as part of the Integrated Flexible Manufacturing Program (IFMP), is developing an integrated manufacturing environment. Several systems are being developed to produce standards and automation tools for specific activities within the manufacturing environment. The Advanced Manufacturing Development System (AMDS) is concentrating on information standards (STEP) and product data transfer; the Expert Cut Planner system (XCUT) is concentrating on machining operation process planning standards and automation capabilities; the Advanced Numerical Control system (ANC) is concentrating on NC data preparation standards and NC data generation tools; the Inspection Planning and Programming Expert system (IPPEX) is concentrating on inspection process planning, coordinate measuring machine (CMM) inspection standards and CMM part program generation tools; and the Intelligent Scheduling and Planning System (ISAPS) is concentrating on planning and scheduling tools for a flexible manufacturing system environment. All of these projects are working together to address information exchange, standardization, and information sharing to support rapid prototyping in a Flexible Manufacturing System (FMS) environment. THE ACTOR MODEL Final Report
Carl Hewitt 1993 7 p
(Contract N00014-88-K-0460)
(AD-A260196) Avail: CASI HC A02/MF A01

The objective of the Actor Model project is to contribute to the science of large scale concurrent systems and the technology which is enabled by this science. This work is based on the Actor Model, a universal paradigm for concurrent computation in which primitive computational entities (actors) communicate by passing messages. The inherent concurrency, reconfigurability, and asynchronous nature of the actor paradigm make it ideally suited for modeling and constructing sophisticated large scale concurrent systems on general purpose concurrent computers. This actor paradigm can also be used as a foundation for study and implementing other diverse concurrency paradigms. The Actor Model project involves study of the Actor model, implementation of a prototype Actor language (Acore), and study of large scale experimental actor systems. GRA

DEVELOPMENT OF CODE EVALUATION CRITERIA FOR ASSESSING PREDICTIVE CAPABILITY AND PERFORMANCE Final Report, Mar. 1991 - Mar. 1993
Shyi-Jang Lin, S. L. Barson, M. M. Sindir, and G. H. Prueger Mar. 1993 47 p
(Contract NAS8-38858)
(NASA-CR-192623; NAS 1.26:192623; RI/RD-93-124) Avail: CASI HC A03/MF A01

Computational Fluid Dynamics (CFD), because of its unique ability to predict complex three-dimensional flows, is being applied with increasing frequency in the aerospace industry. Currently, no consistent code validation procedure is applied within the industry. Such a procedure is needed to increase confidence in CFD and reduce risk in the use of these codes as a design and analysis tool. This final contract report defines classifications for three levels of code validation, directly relating the use of CFD codes to the engineering design cycle. Evaluation criteria by which codes are measured and classified are recommended and discussed. Criteria for selecting experimental data against which CFD results can be compared are outlined. A four phase CFD code validation procedure is described in detail. Finally, the code validation procedure is demonstrated through application of the REACT CFD code to a series of cases culminating in a code to data comparison on the Space Shuttle Main Engine High Pressure Fuel Turbopump Impeller. TELESCIENCE TESTBED PROGRAM: A STUDY OF SOFTWARE FOR SIRTF INSTRUMENT CONTROL Final Technical Report
Erick T. Young 30 Jun. 1992 25 p
(Grant NAG2-661)
(NASA-CR-192764; NAS 1.26:192764) Avail: CASI HC A03/MF A01

As a continued element in the Telescience Testbed Program (TTP), the University of Arizona Steward Observatory and the Electrical and Computer Engineering Department (ECE) jointly developed a testbed to evaluate the Operations and Science Instrument System (OASIS) software package for remote control of an instrument for the Space Infrared Telescope Facility (SIRTF). SIRTF is a cryogenically-cooled telescope with three focal plane instruments that will be the infrared element of NASA's Great Observatory series. The anticipated launch date for SIRTF is currently 2001. Because of the complexity of the SIRTF mission, it was not expected that the OASIS package would be suitable for instrument control in the flight situation, however, its possible use as a common interface during the early development and ground test phases of the project was considered. The OASIS package, developed at the University of Colorado for control of the Solar Mesosphere Explorer (SME) satellite, serves as an interface between the operator and the remote instrument which is connected via a network. OASIS provides a rudimentary windowing system as well as support for standard spacecraft communications protocols. The experiment performed all of the functions required of the MIPS simulation program. Remote control of the instrument was demonstrated but found to be inappropriate for SIRTF at this time for the following reasons: (1) programming interface is too difficult; (2) significant computer resources were required to run OASIS; (3) the communications interface is too complicated; (4) response time was slow; and (5) quicklook of image data was not possible. INSTRUMENTATION FOR HYPERSONIC AERODYNAMICS RESEARCH WITH TETHERED SATELLITES Final Report, 1 Jan. 1990 - 15 Jan. 1992 (Diskette Supplement)
Leonard T. Melfi, Jr. and Kenneth G. Brown, Jr. Jan. 1992 111 p
Diskette supplement: IBM compatible 5.25-inch DSHD
(Contract NAS1-18584; RTOP 967-30-30-01)
(NASA-CR-191435; NAS 1.26:191435; NONP-Suppl-DK-93-159784) Avail: Issuing Activity (Center for AeroSpace Information) HC/DK A13

Work on instrumentation for hypersonic aerodynamics research with tethered satellites with NASA LaRC began on 2 Jan. 1990, and extended through 31 Dec. 1991. The first year's effort concentrated on shuttle borne tether satellite systems, measurement requirements, instruments assessment, aerothermodynamic instrumentation definition, and tether technology. These aspects were studied in detail and are reported in a review article entitled 'Downward Deployed Tethered Satellite Systems, Measurement Techniques, and Instrumentation: A Review' by Kenneth G. Brown, Jr. et. al. The second year's effort concentrated on the development of compute codes to analyze instrument data from NASA's SEDS mission. This mission is planned to fly in early 1993 and consists of an instrumented end-mass deployed with a tether from an orbiting second stage of a Delta rocket. Additional data is recorded on the accompanying floppy disk.

EDITING IMAGES OF TEXT

S. C. Bagley and G. E. Kopec Nov. 1992 23 p

(PB93-149896; ISTL-92-3) Avail: CASI HC A03/MF A01

Image EMACS, a text editor for binary document images which illustrates an alternative to the format conversion paradigm are described. The goal of Image EMACS is to allow images to text to be created and manipulated as if they were conventional text files. The inputs and outputs of Image EMACS are simple interpretations of image elements, rather than a complete symbolic description of the image. Several applications of Image EMACS are presented including editing multilingual documents, reformatting text to a new column width, differential comparison of two versions of a document, and preprocessing an image prior to character recognition.

TP PROTOCOL FROM SPECIFICATION TO IMPLEMENTATION

Ing Widya, Gert-Jan vanderHeijden (Oce Nederland B.V., Venlo.), and Francois Juillot (SYSECA DSIT, Buc, France.) 1992 25 p Sponsored by Commission of European Communities

(Memo-INF-92-42; TIOS-92-18; ETN-93-93198) Copyright Avail: CASI HC A03/MF A01

An exercise concerned with the specification and implementation design of a realistic OSI (Open System Interconnection) application layer protocol in accordance with the LotoSphere methodology is presented. Some of the experiences acquired during the design process are reported. The main motivation of the work presented is the need to have a engine assessment of the design methodology for its industrial applicability. The OSI Transaction Processing (TP) protocol is selected as a design example due to its distributed nature and its entangled compositional structure. The OSI TP structure is comprised of the following: OSI common; application service elements AD-SE (Association Control Service Element) and CCR-SE (Commitment, Concurrency and recovery SE); and TP specific elements. The design trajectory of the TP specific parts is discussed. The design process starts with a nonformalized protocol description and after several design steps ends with an implementation specified in LOTOS. This process is globally constrained by realizability and open endedness requirements. The derived implementation is expressed in a state (machine) oriented way and is, in a design sense, close to a realization. UNIX workstations with a running ISODE (Internationapl Standards Organization Development Environment) are selected as the realization environment. An alternative design approach which suitably fits ISODE is exposed but not elaborated. A second design cycle is undertaken to enable some evaluation in the open endedness of the specification.

AUTOMOUSE: AN IMPROVEMENT TO THE MOUSE COMPUTERIZED UNCERTAINTY ANALYSIS SYSTEM OPERATIONAL MANUAL

Albert J. Klee Aug. 1992 210 p

(PB93-100113; EPA/600/R-92/145; EPA/SW/DK-92/053A) Avail: CASI HC A10/MF A03

Under a mandate of national environmental laws, the agency strives to formulate and implement actions leading to a compatible balance between human activities and the ability of natural systems to support and nurture life. The Risk Reduction Engineering Laboratory is responsible for planning, implementing, and managing research development, and demonstration programs to provide an authoritative, defensible engineering basis in support of the policies, programs, and regulations of the EPA with respect to drinking water, wastewater, pesticides, toxic substances, solid and hazardous wastes, and Superfund-related activities. The publication is one of the products of that research and provides a vital communication link between the researcher and the user community. The manual describes a system, called MOUSE (for Modular Oriented Uncertainty SystEm), for dealing with the computational problems of uncertainty, specifically in models that consist of a set of one or more equations. Since such models are frequently encountered in the fields of environmental science, risk analysis, economics, and engineering, the system has broad application throughout these fields. An important part of the MOUSE system is AutoMOUSE which actually writes the computer programs required for the uncertainty analysis computations. Thus, no prior programming knowledge is needed to learn or use MOUSE and, because of its transportability and compactness, the system can be run on a wide variety of personal computers available to the U.S. Environmental Protection Agency and/or its contractors and grantees.

PERFORMANCE AND STATE-SPACE ANALYSES OF SYSTEMS USING PETRI NETS

James Francis Watson, III Nov. 1992 191 p

(Grant NAGw-1333)

(NASA-CR-193195; NAS 1.26:193195; RPI-CIRSSE-129) Copyright Avail: CASI HC A09/MF A02

The goal of any modeling methodology is to develop a mathematical description of a system that is accurate in its representation and also permits analysis of structural and/or performance properties. Inherently, trade-offs exist between the level detail in the model and the ease with which analysis can be performed. Petri nets (PN's), a highly graphical modeling methodology for Discrete Event Dynamic Systems, permit representation of shared resources, finite capacities, conflict, synchronization, concurrency, and timing between state changes. By restricting the state transition time delays to the family of exponential density functions, Markov chain analysis of performance problems is possible. One major drawback of PN's is the tendency for the state-space to grow rapidly (exponential complexity) compared to increases in the PN constructs. It is the state space, or the Markov chain obtained from it, that is needed in the solution of many problems. The theory of state-space size estimation for PN's is introduced. The problem of state-space size estimation is defined, its complexities are examined, and estimation algorithms are developed. Both top-down and bottom-up approaches are pursued, and the advantages and disadvantages of each are described. Additionally, the author's research in non-exponential transition modeling for PN's is discussed. An algorithm for approximating non-exponential transitions is developed. Since only basic PN constructs are used in the approximation, theory already developed for PN's remains applicable. Comparison to results from entropy theory show the transition performance is close to the theoretic optimum. Inclusion of non-exponential transition approximations improves performance results at the expense of increased state-space size. The state-space size estimation theory provides insight and algorithms for evaluating this trade-off.

PROCESS AND EVENT ABSTRACTION FOR DEBUGGING DISTRIBUTED PROGRAMS Ph.D. Thesis
Wing Hong Cheung Waterloo, Ontario Univ. of Waterloo 1989 226 p
(ISBN-0-315-51884-7; CTN-93-60643) Copyright Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, J8X 3X2, Canada, HC

A rigorous basis is presented for the development of abstraction facilities in a distributed debugger. A distributed program is modelled as a cluster of cooperating processes, communicating with each other via messages. The program behavior is described as a sequence of partially ordered events generated by those processes. The event ordering is defined by a precedence relation and is recorded with partially ordered logical clocks. Abstraction is defined as an operation to condense a subgraph of components into a single component. Abstraction is applied to the program behavior in two dimensions: process structure and event sequence. Preservation of event precedences in both process and event abstraction is demonstrated along with the correct maintenance of observed primitive events and their precedences. Based on this result, guidelines and algorithms are developed to construct abstraction facilities in a distributed debugger. Three mechanisms for event recording, replay, and timestamp construction are also developed to capture precedence and additional information of primitive events. The development permits the debugger designer to trade runtime overhead against debugging time processing. Author (CISTI)

A PARAMETER-CONTROLLED RELAXATION ALGORITHM FOR BAYESIAN RESTORATION OF IMAGES USING THE MAXIMUM ENTROPY METHOD (DESIGN, ANALYSIS, MACH BAND SIMULATION AND PARALLELIZATION) Ph.D. Thesis
Kalpagam Krishnan Edmonton, Alberta Univ. of Alberta 1990 236 p
(ISBN-0-315-64776-0; CTN-93-60645) Copyright Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, J8X 3X2, Canada, HC

A relaxation scheme is developed for the maximum entropy (ME) method and applied to the Bayesian restoration of images. The scheme involves optimizing a system by controlling its states in sequence, using specific parameter strategies. The results evolve directly from the functional analysis of a stationary point equation derived from the Bayesian based entropy optimization functional. The convergence behavior of the system is characterized in terms of its state entropy. Given a degraded input image and the degradation parameter(s), the relaxation scheme performs restoration using a numerical algorithm. For inputs degraded by Gaussian noise, specification of noise variance is not necessary. The algorithm estimates the control parameters adaptively to minimize the influence of the strength of the external constraints upon the system, and also allows the user to specify a parameter to control the speed of convergence. Test studies demonstrate an expected behavior of the algorithm. New prospects for the ME method are shown in edge detection and enhancement. Parallelization of the restoration algorithm is attempted, with initial implementation studies conducted on Myrias computers. Performance studies show optimum efficiencies of 91 percent with 16 processors for the convolution algorithm and 78.4 percent with 8 processors for the ME deconvolution algorithm using the relaxation scheme. SHAPE-CONTOUR RECOGNITION USING MOMENT INVARIANTS Ph.D. Thesis
Saeid Omar Belkasim Windsor, Ontario Univ. of Windsor 1990 172 p
(ISBN-0-315-61036-0; CTN-93-60659) Copyright Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada, HC

A comparative evaluation of the effectiveness of moment invariants as shape sensitive features for pattern recognition applications is presented. Zernike, pseudo Zernike, Hu, Bamieh, and regular moment invariants were compared for their performance in a shape recognition study using two data sets: handwritten numerals and pictures of military aircraft under various war loads. Zernike moment invariants (ZMI) and pseudo Zernike moment invariants (PZMI) have been derived in a new form for the nth order. New normalization procedures aimed at minimizing the effect of information redundancy as well as reducing the dynamic range have been proposed for both ZMI and PZMI. Techniques for reducing the feature vector size have also been proposed to improve the efficiency of both ZMI and PZMI. Using the new normalization scheme, it is shown that Zernike moment invariants as derived in this form yield a better performance. New algorithms have also been developed for the optimum thresholding and contour extraction of images. Author (CISTI)

A USER'S MANUAL FOR SOFTWARE GPR92
K. M. Khoda and C. Storey Sep. 1992 22 p
(MATHS-REPT-A-175; ETN-93-93559) Avail: CASI HC A03/MF A01

GPR92 is an optimized software routine for the various implementations of the Generalized Polak-Ribiere (GPR) algorithm for nonlinear optimization. The algorithm is based on the effects of inexact line searches on conjugate gradient methods. A description of GPR92 which should help the user to gain sufficient insight into the routine to create and execute a driver program to implement it is presented. GPR92 is designed to minimize an unconstrained nonlinear function of several variables whether the first partial derivatives are known analytically or not. The user must provide the subroutine that defines the objective function and/or its first partial derivatives if available. The derivatives are approximated numerically when they are not known analytically. GPR92 is best used on problems having smooth, that is, at least twice continuously differentiable objective functions, without any constraints in the variables. Because of its modest storage requirements it could be useful on large scale problems for which computer storage is a limiting factor. ESA

The implementation of explicit finite element methods with contact-impact on massively parallel SIMD computers is described. The basic parallel finite element algorithm employs an exchange process which minimizes interprocessor communication at the expense of redundant computations and storage. The contact-impact algorithm is based on the pinball method in which compatibility is enforced by preventing interpenetration on spheres embedded in elements adjacent to surfaces. The enhancements to the pinball algorithm include a parallel assembled surface normal algorithm and a parallel detection of interpenetrating pairs. Some timings with and without contact-impact are given. DOE

Lawrence Berkeley Laboratory (LBL) is a beta test site for the UniTree mass storage system. Our initial configuration is based on a Sun workstation and includes 10 gigabytes (GB) of magnetic disk cache, 700 GB of Exabyte 8 mm tape storage, with two tape robots. We support a user community of 15 to 20 active users, about 250,000 files, and 33 GB of user data. The largest file stored is 1.5 GB. As of May 1992, we consider the system to be adequately stable and reliable for production use. As a beta site, we have worked on the Sun port, on the tape drivers for SunOS, and on integrating our tape robots into the UniTree software. File retrieval from tape usually takes less than five minutes. Continuing concerns are tape longevity and reliability, and improving performance to support 100 Mb FDDI. DOE

INVESTIGATION OF THE POSSIBILITY OF SUCCESS OF THE FUTUREBUS+ AS A MILITARY AND COMMERCIAL STANDARD IN THE CURRENT CONTEXT, REVISION A
Duane L. Anderson 28 Oct. 1991 80 p
(CTN-93-60712) Copyright Avail: CASI HC A05/MF A01

A review is presented of the performance of new and future high performance microprocessors, military and commercial computing requirements, and the possible reaction of consumers of computer technology to Futurebus+. An in-depth review of multiprocessor interconnects is then made, considering features, market, enhancements, and issues important in satisfying military requirements. The review of leading established backplane busses includes the VMEbus, Multibus 2, EISA, Micro Channel, and NuBus. It is shown that most if not all of the

techniques and features used on the Futurebus+ can be applied to the established busses. A review of possible new bus standards reveals a possibly significant new bus standard, Dynabus, that has a level of performance somewhat greater than that of Futurebus+, and functionality similar to that of the Futurebus+. A review of ring networks, switched networks, and point to point networks suggests that sometimes such structures can provide superior price and performance characteristics to Futurebus+. It is concluded that the Futurebus+ has insufficient performance to satisfy needs of current and future high performance microprocessors, and should not be counted on to become a widely used commercial standard. A recent approach for solving sparse triangular systems of equations on massively parallel computers employs a factorization of the triangular coefficient matrix to obtain a representation of its inverse in product form. The number of general communication steps required by this approach is proportional to the number of factors in the factorization. The triangular matrix can be symmetrically permuted to minimize the number of factors over suitable classes of permutations, and thereby the complexity of the parallel algorithm can be minimized. Algorithms for minimizing the number of factors over several classes of permutations have been considered in earlier work. Let F = L + L(exp T) denote the symmetric filled matrix corresponding to a Cholesky factor L, and let G(sub F) denote the adjacency graph of F. In this paper we consider the problem of minimizing the number of factors over all permutations which preserve the structure of G(sub F). The graph model of this problem is to partition the vertices G(sub F) into the fewest transitively closed subgraphs over all perfect elimination orderings while satisfying a certain precedence relationship. The solution to this chordal graph partitioning problem can be described by a greedy scheme which eliminates a largest permissible subgraph at each step. Further, the subgraph eliminated at each step can be characterized in terms of lengths of chordless paths in the current elimination graph. This solution relies on several results concerning transitive perfect elimination orderings introduced in this paper. We describe a partitioning algorithm with (Omicron)(absolute value of V + absolute value of E) time and space complexity. DOE

(DE93-007408; UCRL-ID-112221) Avail: CASI HC A01/MF A01

The original goal stated in the collaboration agreement from LCC's perspective was 'to show that networking tools available in UNICOS perform well enough to meet the requirements of LCC customers'. This translated into evaluating how easy it was to port ELROS over CRI's ISO 2.0, which itself is a port of ISODE to the Cray. In addition we tested the interoperability of ELROS and ISO 2.0 programs running on the Cray, and communicating with each other, and with servers or clients running on other machines. To achieve these goals from LCC's side, we ported ELROS to the Cray, and also obtained and installed a copy of the ISO 2.0 distribution from CRI. CRI's goal for the collaboration was to evaluate the usability of ELROS. In particular, we were interested in their potential feedback on the use of ELROS in implementing ISO protocols--whether ELROS would be easter to use and perform better than other tools that form part of the standard ISODE system. To help achieve these goals for CRI, we provided them with a distribution tar file containing the ELROS system, once we had completed our port of ELROS to the Cray. DOE

PARALLEL PROCESSOR FOR REAL-TIME STRUCTURAL CONTROL
B. L. Tise 1992 9 p Presented at the Conference on Smart Structures and Materials, Albuquerque, NM, 1-4 Feb. 1993
(Contract DE-AC04-76DP-00789)
(DE93-006284; SAND-92-2918C; CONF-930220-1) Avail: CASI HC A02/MF A01

A parallel processor that is optimized for real-time linear control has been developed. This modular system consists of A/D modules, D/A modules, and floating-point processor modules. The scalable processor uses up to 1,000 Motorola DSP96002 floating-point processors for a peak computational rate of 60 GFLOPS. Sampling rates up to 625 kHz are supported by this analog-in to analog-out controller. The high processing rate and parallel architecture make this processor suitable for computing state-space equations and other multiply/accumulate-intensive digital filters. Processor features include 14-bit conversion devices, low input-output latency, 240 Mbyte/s synchronous backplane bus, low-skew clock distribution circuit, VME connection to host computer, parallelizing code generator, and look-up-tables for actuator linearization. This processor was designed primarily for experiments in structural control. The A/D modules sample sensors mounted on the structure and the floating-point processor modules compute the outputs using the programmed control equations. The outputs are sent through the D/A module to the power amps used to drive the structure's actuators. The host computer is a Sun workstation. An Open Windows-based control panel is provided to facilitate data transfer to and from the processor, as well as to control the operating mode of the processor. A diagnostic mode is provided to allow stimulation of the structure and acquisition of the structural response via sensor inputs. DOE

CYTOKINES AND IMMUNE SURVEILLANCE IN HUMANS Semiannual Progress Report No. 5, Oct. 1992 - Mar. 1993

Gerald Sonnenfeld Mar. 1993 30 p

(Grant NAG9-485)

(NASA-CR-192728; NAS 1.26:192728) Avail: CASI HC A03/MF A01

Evidence from both human and rodent studies has indicated that alterations in immunological parameters occur after space flight. Among the parameters shown, by us and others, to be affected is the production of interferons. Interferons are a family of cytokines that are antiviral and play a major role in regulating immune responses that control resistance to infection. Alterations in interferon and other cytokine production and activity could result in changes in immunity and a possible compromise of host defenses against both opportunistic and external infections. The purpose of the present study is to further explore the effects of space flight on cytokines and cytokine-directed immunological function. Author

(DE93-005815; UCRL-JC-112311; CONF-9211128-6) Avail: CASI HC A02/MF A01

Monte Carlo particle transport has been shown to be very well suited to exploit the dramatic speedups available from Multiple Parallel Processors (MPP's). Other portions of large-scale codes that simultaneously simulate a variety of physical processors are less easily adapted to MPPS. PMC (Parallel Monte Carlo) is a package of generic interface routines that allow distributed processing where Monte Carlo is performed on an MPP while the other physics is simulated on a conventional, serial supercomputer. PMC handles passing of messages between the serial machine and the MPP, passing of messages between nodes on the MPP, distributing work between nodes, and providing independent, reproducible sequences of random numbers. Reproducibility is ensured through multi-tasking on nodes. As long as the number of tasks remains constant from one problem execution to another, the Monte Carlo simulation will yield identical results regardless of the number of nodes used. A task is a portion of work such as advancing a collection of particles from the beginning of a time step to its end. PMC handles this multi-tasking. PMC has been designed to allow re-use of existing Monte Carlo transport packages with minimal rewrite. DOE

EFFICIENTLY MODELING NEURAL NETWORKS ON MASSIVELY PARALLEL COMPUTERS

R. M. Farber 1992 11 p Presented at the NASA Conference, Houston, TX, 1-3 Jun. 1992

(Contract W-7405-eng-36)

(DE93-003787; LA-UR-92-3568; CONF-9206318-1) Avail: CASI HC A03/MF A01

Neural networks are a very useful tool for analyzing and modeling complex real world systems. Applying neural network simulations to real world problems generally involves large amounts of data and massive amounts of computation. To efficiently handle the computational requirements of large problems, a highly efficient neural network compiler for serial computers, vector computers, vector parallel computers, and fine grain SIMD computers such as the CM-2 connection machine was implemented. The mapping used by the compiler to implement feed-forward backpropagation neural networks for a SIMD architecture parallel computer is described. Thinking Machines Corporation has benchmarked our code at 1.3 billion interconnects per second (approximately 3 gigaflops) on a 64,000 processor CM-2 connection machine (Singer 1990). This mapping is applicable to other SIMD computers and can be implemented on computers such as the CM-5 connection machine. Our mapping has virtually no communications overhead with the exception of the communications required for a global summation across the processors. Very large neural networks which have many neurons and interconnects can be modeled efficiently and the mapping can be extended to arbitrarily large networks by merging the memory space of separate processors with fast adjacent processor inter-processor communications. The simulation of only feed forward neural network is considered although this method is extendible to recurrent networks. DOE

AUTOMATIC CODE GENERATION FOR DISTRIBUTED ROBOTIC SYSTEMS

J. P. Jones 1993 8 p Presented at the 5th Topical Meeting on Robotics and Remote Systems, Knoxville, TN, 26-29 Apr. 1993

(Contract DE-AC05-84OR-21400)

(DE93-005779; CONF-930403-11) Avail: CASI HC A02/MF A01

Hetero Helix is a software environment which supports relatively large robotic system development projects. The environment supports a heterogeneous set of message-passing LAN-connected common-bus multiprocessors, but the programming model seen by software developers is a simple shared memory. The conceptual simplicity of shared memory makes it an extremely attractive programming model, especially in large projects where coordinating a large number of people can itself become a significant source of complexity. We present results from three system development efforts conducted at Oak Ridge National Laboratory over the past several years. Each of these efforts used automatic software generation to create 10 to 20 percent of the system. DOE

IMPLEMENTATION OF A MONTE CARLO ALGORITHM FOR NEUTRON TRANSPORT ON A MASSIVELY PARALLEL SIMD MACHINE

R. S. Baker 1992 9 p Presented at the International Topical Meeting on Mathematical Methods and Supercomputing in Nuclear Application, Karlsruhe, Germany, 19-23 Apr. 1993

(Contract W-7405-eng-36)
(DE93-005461; LA-UR-92-4364; CONF-930404-2) Avail: CASI HC A02/MF A01

We present some results from the recent adaptation of a vectorized Monte Carlo algorithm to a massively parallel architecture. The performance of the algorithm on a single processor Cray Y-MP and a Thinking Machine Corporations CM-2 and CM-200 is compared for several test problems. The results show that significant speedups are obtainable for vectorized Monte Carlo algorithms on massively parallel machines, even when the algorithms are applied to realistic problems which require extensive variance reduction. However, the architecture of the Connection Machine does place some limitations on the regime in which the Monte Carlo algorithm may be expected to perform well. DOE

TIME DEPENDENT CLASSIFICATION OF FEATURES WITH A NONLINEAR, DYNAMIC NETWORK Ph.D. Thesis - Helsinki Univ.
Ari M. Vepsaelaeinen Nov. 1991 154 p Sponsored by Jenny and Antii Wihuri Foundation
(VTT-Pubs-83; ISBN-951-38-4061-1; ETN-93-93479) Copyright Avail: CASI HC A08/MF A02

A review of results and methods presented in previous publications is presented. The publications are reprinted. Temporally varying classification by a dynamic classifier network is introduced. The dynamic classifier network consists of several independent nonlinear classifiers in parallel. The subclassifiers adapt to the measurements with a variety of adaptation rates. The output of the classifier network can be calculated as a weighted sum of the outputs of each subclassifier. Two methods to optimize the weighting are given. However, even a simple weighting function gives reasonable results. The network might be considered as a temporal associative memory. Because of nonlinearities and the ensuring chaos the behavior of the network can be very complicated. Algorithms to calculate the fractal and correlation dimension are given. With these dimensions the algorithms can estimate how complicated the behavior of a system is and how many parameters are needed to describe its behavior. An extension of geodesic distance transform called distance transform in curved space, is presented. This transform can for example, be used to model dynamic decision manifolds. Some new properties of fractals are presented. These properties can be utilized efficiently when defining the Lyapunov exponents and the basins of attraction for maps. The methods presented have several application areas. ESA

DISTRIBUTED COMPUTER SYSTEMS AND LOGISTICS SYSTEMS: WHAT DO THEY HAVE IN COMMON BESIDES DISTRIBUTION?
Leonard Franken and Boudewijn R. Haverkort 1992 32 p
(Memo-INF-92-44; TIOS-92-20; TI-RA-92-918; ETN-93-93200) Copyright Avail: CASI HC A03/MF A01

The nature of distributed computer systems and logistics systems is discussed and the question as to what makes these systems distributed is answered. Various reasons for the distributed nature such as scalability, availability increase, performance increase, the distributed nature of the applications etc., are given. The design trajectory for both types of systems is compared. A number of common aspects are recognized. To clearly identify the similarities and differences, a common framework for distributed computer systems and logistics sustems is presented. The role of quantitative analysis in the lifecycle of these systems is shown. It turns out that Quality of Service aspects (QoS) play an important role in all phases of the system lifecycle, and consequently, that quantitative analysis for the determination of the QoS plays an important role in all phases of the system lifecycle. However, quantitative aspects are not the only aspects of importance. Functional aspects (correctness, etc.), especially in combination with quantitative analysis, are of importance. This combinatiion is relatively new. No well established modeling frameworks have been defined for this purpose yet. A number of attempts in this direction are reported, together with work done on software tools which effectively support these combined methods in the design and reconfiguration of distributed systems. IMPLEMENTATION AND PERFORMANCE EVALUATION OF A PARALLEL TRANSITIVE CLOSURE ALGORITHM ON PRISMA/DB
Maurice A. W. Houtsma, Annita N. Wilschut, and Jan Flokstra Jun. 1992 22 p Sponsored in part by Royal Netherlands Academy of Arts and Sciences
(Memo-INF-92-45; ETN-93-93201) Copyright Avail: CASI HC A03/MF A01

An experimental performance study of the parallel computation of transitive closure operations on a parallel database system is described. This work brings two research efforts together: the development of an efficient execution strategy for the parallel computation of path problems,

called the Disconnection Set Approach; and the development and implementation of a parallel, main memory DBMS (Data Base Management System), called PRISMA/DB. The implementation of the disconnection set approach on PRISMA/DB is reported, showing how the latter's design allowed the easy extension of the functionality of the system. It is shown that the parallel implementation of the disconnection set approach yields good performance characteristics, and that linear speedup with respect to a special purpose single processor algorithm is achieved. A number of experiments that show to what extent data fragmentation issues influence the performance of the disconnection set approach are described. ESA

MATCH AND MOVE: AN APPROACH TO DATA PARALLEL COMPUTING Ph.D. Thesis

Thomas J. Sheffler Oct. 1992 232 p

(Contract F33615-90-C-1465; ARPA Order 7597)

(AD-A259915; CMU-CS-92-203) Avail: CASI HC A11/MF A03

The match operation, introduced by G. Sabot, is a parallel primitive describing a communication pattern. For two vectors of keys, called the 'source' and 'destination,' a path is indicated for each element of the source to each destination element having an equal key. The result of the match operation is a data structure called a 'mapping' encapsulating these paths. A move operation sends data from the sites of a source data vector through the paths of the mapping to a destination data vector. If the mapping is many-to-one, a combining function, such as add, max, or min, specifies how collisions are resolved at the destination sites. The match and move operations provide a unified set of parallel primitives that at once satisfy the conflicting demands of generality and efficiency. The generality of the approach is illustrated by showing many algorithms implemented with match, focusing on algorithms for graphs, sparse matrices, and binary tree structures. These types of problems are characterized as involving dynamic structural change, and are typically difficult to implement on parallel architectures. By using the framework allowed by the match operation, the algorithms are straightforward and simple to understand. Because match and move may be implemented efficiently on many different parallel and vector architectures, algorithms expressed in this manner achieve architecture independence. In addition, because there are many implementation strategies for the operators available for a given machine, they provide a level of implementation independence. This level of abstraction is supported without sacrificing absolute performance, however. GRA

UNIVERSAL CHANNEL NETWORK, OR COMBINING THE BEST OF TOKEN RING AND SLOTTED RING

H. L. Pasch and I. G. Niemegeers 1992 24 p

(MEMO-INF-92-41; TIOS-92-17; ETN-93-93197) Copyright Avail: CASI HC A03/MF A01

Two access mechanisms complementary in performance, the token ring and the slotted ring, are discussed. While the token ring outperforms the slotted ring for long messages, the latter performs significantly better for short messages. The factor that causes this difference is the number of tokens in the ring. A Universal Channel Network (UCN) design is proposed, in which the number of tokens was made adaptive, resulting in a network that can be made to behave like both the token ring and the slotted ring, or anything in between. UCN performs optimally for any given message length. It is shown how the number of tokens influences the behavior of the UCN, and its performance is compared with that of the token ring and the slotted ring. Its performance is then compared with that of DQDB (Distributed Queue Dual Bus) and FDDI (Fiber Distributed Data Interface) using several different configurations that are representative for MAN's (Metropolitan Area Networks). It is determined how configuration parameters like transmission, rate, and network length influence the performance of the networks. The workload model used is a detailed representation of a typical today's traffic, extrapolated to the future. Because of the uncertainty concerning future MAN traffic, two versions of the workload model are used. In the first version, voice and video sources are modeled as constant bit rate sources. In the second version, variable bit rate sources are used to represent voice and video sources. The network performance for both coding techniques is compared. ESA

Avail: CASI HC A03/MF A02

The relationship between the sequential hard c-means (SHCM), learning vector quantization (LVQ), and fuzzy c-means (FCM) clustering algorithms is discussed. LVQ and SHCM suffer from several major problems. For example, they depend heavily on initialization. If the initial values of the cluster centers are outside the convex hull of the input data, such algorithms, even if they terminate, may not produce meaningful results in terms of prototypes for cluster representation. This is due in part to the fact that they update only the winning prototype for every input vector. The impact and interaction of these two families with Kohonen's self-organizing feature mapping (SOFM), which is not a clustering method, but which often leads ideas to clustering algorithms is discussed. Then two generalizations of LVQ that are explicitly designed as clustering algorithms are presented; these algorithms are referred to as generalized LVQ = GLVQ; and fuzzy LVQ = FLVQ. Learning rules are derived to optimize an objective function whose goal is to produce 'good clusters'. GLVQ/FLVQ (may) update every node in the clustering net for each input vector. Neither GLVQ nor FLVQ depends upon a choice for the update neighborhood or learning rate distribution - these are taken care of automatically. Segmentation of a gray tone image is used as a typical application of these algorithms to illustrate the performance of GLVQ/FLVQ. Author (revised)

POSSIBILISTIC CLUSTERING FOR SHAPE RECOGNITION
James M. Keller (Missouri Univ., Columbia.) and Raghu Krishnapuram (Missouri Univ., Columbia.) *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 2 Jan. 1993 p 227-236 Previously announced as N93-18228 (For primary document see N93-22206 08-63)
Avail: CASI HC A02/MF A02

Clustering methods have been used extensively in computer vision and pattern recognition. Fuzzy clustering has been shown to be advantageous over crisp (or traditional) clustering in that total commitment of a vector to a given class is not required at each iteration. Recently fuzzy clustering methods have shown spectacular ability to detect not only hypervolume clusters, but also clusters which are actually 'thin shells', i.e., curves and surfaces. Most analytic fuzzy clustering approaches are derived from Bezdek's Fuzzy C-Means (FCM) algorithm. The FCM uses the probabilistic constraint that the memberships of a data point across classes sum to one. This constraint was used to generate the membership update equations for an iterative algorithm. Unfortunately, the memberships resulting from FCM and its derivatives do not correspond to the intuitive concept of degree of belonging, and moreover, the algorithms have considerable trouble in noisy environments. Recently, the clustering problem was cast into the framework of possibility theory. Our approach was radically different from the existing clustering methods in that the resulting partition of the data can be interpreted as a possibilistic partition, and the membership values may be interpreted as degrees of possibility of the points belonging to the classes. An appropriate objective function whose minimum will characterize a good possibilistic partition of the data was constructed, and the membership and prototype update equations from necessary conditions for minimization of our criterion function were derived. The ability of this approach to detect linear and quartic curves in the presence of considerable noise is shown. Author (revised)

APPLICATION OF GENETIC ALGORITHMS TO TUNING FUZZY CONTROL SYSTEMS
Todd Espy, Endre Vombrack, and Jack Aldridge *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 2 Jan. 1993 p 237-248 (For primary document see N93-22206 08-63)
(Contract NAS9-18527)
Avail: CASI HC A03/MF A02

Real number genetic algorithms (GA) were applied for tuning fuzzy membership functions of three controller applications. The first application is our 'Fuzzy Pong' demonstration, a controller that controls a very responsive system. The performance of the automatically tuned membership functions exceeded that of manually tuned membership functions both when the algorithm started with randomly generated functions and with the best manually-tuned functions. The second GA tunes input membership functions to achieve a specified control surface. The third application is a practical one, a motor controller for a printed circuit manufacturing system. The GA alters the positions and overlaps of the membership functions to accomplish the tuning. The applications, the real number GA approach, the fitness function and population parameters, and the performance improvements achieved are discussed. Directions for further research in tuning input and output membership functions and in tuning fuzzy rules are described. Author (revised)

THE 3-D IMAGE RECOGNITION BASED ON FUZZY NEURAL NETWORK TECHNOLOGY
Kaoru Hirota, Kenichi Yamauchi, Jun Murakami, and Kei Tanaka *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 2 Jan. 1993 p 249-256 Sponsored in part by Science and Technology Agency (For primary document see N93-22206 08-63)
Avail: CASI HC A02/MF A02

Three dimensional stereoscopic image recognition system based on fuzzy-neural network technology was developed. The system consists of three parts; preprocessing part, feature extraction part, and matching part. Two CCD color camera image are fed to the preprocessing part, where several operations including RGB-HSV transformation are done. A multi-layer perception is used for the line detection in the feature extraction part. Then fuzzy matching technique is introduced in the matching part. The system is realized on SUN spark station and special image input hardware system. An experimental result on bottle images is also presented. Author (revised)

A PROPOSAL OF FUZZY CONNECTIVE WITH LEARNING FUNCTION AND ITS APPLICATION TO FUZZY RETRIEVAL SYSTEM
Isao Hayashi, Eiichi Naito, Jun Ozawa, and Noboru Wakami *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 2 Jan. 1993 p 257-271 Sponsored in part by Science and Technology Agency (For primary document see N93-22206 08-63)
Avail: CASI HC A03/MF A02

A new fuzzy connective and a structure of network constructed by fuzzy connectives are proposed to overcome a drawback of conventional fuzzy retrieval systems. This network represents a retrieval query and the fuzzy connectives in networks have a learning function to adjust its parameters by data from a database and outputs of a user. The fuzzy retrieval systems employing this network are also constructed. Users can retrieve results even with a query whose attributes do not exist in a database schema and can get satisfactory results for variety of thinkings by learning function. Author (revised)

APPLICATION OF FUZZY SET AND DEMPSTER-SHAFER THEORY TO ORGANIC GEOCHEMISTRY INTERPRETATION
C. S. Kim and G. H. Isaksen *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 2 Jan. 1993 p 273-281 (For primary document see N93-22206 08-63)
Avail: CASI HC A02/MF A02

An application of fuzzy sets and Dempster Shafter Theory (DST) in modeling the interpretational process of organic geochemistry data for predicting the level of maturities of oil and source rock samples is presented. This was accomplished by (1) representing linguistic imprecision and imprecision associated with experience by a fuzzy set theory, (2) capturing the probabilistic nature of imperfect evidences by a DST, and (3) combining multiple evidences by utilizing John Yen's generalized Dempster-Shafter Theory (GDST), which allows DST to deal with fuzzy information. The current prototype provides collective beliefs on the predicted levels of maturity by combining multiple evidences through GDST's rule of combination. Author (revised)

Avail: CASI HC A01/MF A02

The efficient implementation of on-line adaptation in real time is an important research problem in fuzzy control. The goal is to develop autonomous self-organizing controllers employing system-independent control meta-knowledge which enables them to adjust their control policies depending on the systems they control and the environments in which they operate. An autonomous fuzzy controller would continuously observe system behavior while implementing its control actions and would use the outcomes of these actions to refine its control policy. It could be designed to lie dormant when its control actions give rise to adequate performance characteristics but could rapidly and autonomously initiate real-time adaptation whenever its performance degrades. Such an autonomous fuzzy controller would have immense practical value. It could accommodate individual variations in system characteristics and also compensate for degradations in system characteristics caused by wear and tear. It could also potentially deal with black-box systems and control scenarios. On-going

research in autonomous fuzzy control is reported. The ultimate research objective is to develop robust and relatively inexpensive autonomous fuzzy control hardware suitable for use in real time environments.

DETERMINING THE NUMBER OF HIDDEN UNITS IN MULTI-LAYER PERCEPTRONS USING F-RATIOS
Ben H. Jansen and Pratish R. Desai *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 2 Jan. 1993 p 285-294 (For primary document see N93-22206 08-63)
Avail: CASI HC A02/MF A02

The hidden units in multi-layer perceptrons are believed to act as feature extractors. In other words, the outputs of the hidden units represent the features in a more traditional statistical classification paradigm. This viewpoint offers a statistical, objective approach to determining the optimal number of hidden units required. This approach is based on an F-ratio test, and proceeds in an iterative fashion. The method and its application to simulated time-series data are presented.

A NEW APPROACH FOR DESIGNING SELF-ORGANIZING SYSTEMS AND APPLICATION TO ADAPTIVE CONTROL
P. A. Ramamoorthy, Shi Zhang, Yueqing Lin, and Song Huang *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 2 Jan. 1993 p 295-308 (For primary document see N93-22206 08-63)
Avail: CASI HC A03/MF A02

There is tremendous interest in the design of intelligent machines capable of autonomous learning and skillful performance under complex environments. A major task in designing such systems is to make the system plastic and adaptive when presented with new and useful information and stable in response to irrelevant events. A great body of knowledge, based on neuro-physiological concepts, has evolved as a possible solution to this problem. Adaptive resonance theory (ART) is a classical example under this category. The system dynamics of an ART network is described by a set of differential equations with nonlinear functions. An approach for designing self-organizing networks characterized by nonlinear differential equations is proposed.

An adaptive fuzzy system using the concept of the Adaptive Resonance Theory (ART) type neural network architecture and incorporating fuzzy c-means (FCM) system equations for reclassification of cluster centers was developed. The Adaptive Fuzzy Leader Clustering (AFLC) architecture is a hybrid neural-fuzzy system which learns on-line in a stable and efficient manner. The system uses a control structure similar to that found in the Adaptive Resonance Theory (ART-1) network to identify the cluster centers initially. The initial classification of an input takes place in a two stage process; a simple competitive stage and a distance metric comparison stage. The cluster prototypes are then incrementally updated by relocating the centroid positions from Fuzzy c-Means (FCM) system equations for the centroids and the membership values. The operational characteristics of AFLC and the critical parameters involved in its operation are discussed. The performance of the AFLC algorithm is presented through application of the algorithm to the Anderson Iris data, and laser-luminescent fingerprint image data. The AFLC algorithm successfully classifies features extracted from real data, discrete or continuous, indicating the potential strength of this new clustering algorithm in analyzing complex data sets. The hybrid neuro-fuzzy AFLC algorithm will enhance analysis of a number of difficult recognition and control problems involved with Tethered Satellite Systems and on-orbit space shuttle attitude controller.

FUZZY LOGIC PATH PLANNING SYSTEM FOR COLLISION AVOIDANCE BY AN AUTONOMOUS ROVER VEHICLE Abstract Only
Michael G. Murphy *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 2 Jan. 1993 p 328-329 (For primary document see N93-22206 08-63)
Avail: CASI HC A01/MF A02

The Space Exploration Initiative of the United States will make great demands upon NASA and its limited resources. One aspect of great importance will be providing for autonomous (unmanned) operation of vehicles and/or subsystems in space flight and surface exploration. An additional, complicating factor is that much of the need for autonomy of operation will take place under conditions of great uncertainty or ambiguity. Issues in developing an autonomous collision avoidance subsystem within a path planning system for application in a remote, hostile environment that does not lend itself well to remote manipulation by Earth-based telecommunications is addressed. A good focus is unmanned surface exploration of Mars. The uncertainties involved indicate that robust approaches such as fuzzy logic control are particularly appropriate. Four major issues addressed are (1) avoidance of a fuzzy moving obstacle; (2) backoff from a deadend in a static obstacle environment; (3) fusion of sensor data to detect obstacles; and (4) options for adaptive learning in a path planning system. Examples of the need for collision avoidance by an autonomous rover vehicle on the surface of Mars with a moving obstacle would be wind-blown debris, surface flow or anomalies due to subsurface disturbances, another vehicle, etc. The other issues of backoff, sensor fusion, and adaptive learning are important in the overall path planning system.

Vehicle control in a-priori unknown, unpredictable, and dynamic environments requires many calculational and reasoning schemes to operate on the basis of very imprecise, incomplete, or unreliable data. For such systems, in which all the uncertainties can not be engineered away, approximate reasoning may provide an alternative to the complexity and computational requirements of conventional uncertainty analysis and propagation techniques. Two types of computer boards including custom-designed VLSI chips were developed to add a fuzzy inferencing capability to real-time control systems. All inferencing rules on a chip are processed in parallel, allowing execution of the entire rule base in about 30 microseconds, and therefore, making control of 'reflex-type' of motions envisionable. The use of these boards and the approach using superposition of elemental sensor-based behaviors for the development of qualitative reasoning schemes emulating human-like navigation in a-priori unknown environments are first discussed. Then how the human-like navigation scheme implemented on one of the qualitative inferencing boards was installed on a test-bed platform to investigate two control modes for driving a car in a-priori unknown environments on the basis of sparse and imprecise sensor data is described. In the first mode, the car navigates fully autonomously, while in the second mode, the system acts as a driver's aid providing the driver with linguistic (fuzzy) commands to turn left or right and speed up or slow down depending on the obstacles perceived by the sensors. Experiments with both modes of control are described in which the system uses only three acoustic range (sonar) sensor channels to perceive the environment. Simulation results as well as indoors and outdoors experiments are presented and discussed to illustrate the feasibility and robustness of autonomous navigation and/or safety enhancing driver's aid using the new fuzzy inferencing hardware system and some human-like

reasoning schemes which may include as little as six elemental behaviors embodied in fourteen qualitative rules. Author (revised)

AUTONOMOUS VEHICLE MOTION CONTROL, APPROXIMATE MAPS, AND FUZZY LOGIC Abstract Only

Enrique H. Ruspini *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 2 Jan. 1993 p 343 (For primary document see N93-22206 08-63)

Avail: CASI HC A01/MF A02

Progress on research on the control of actions of autonomous mobile agents using fuzzy logic is presented. The innovations described encompass theoretical and applied developments. At the theoretical level, results of research leading to the combined utilization of conventional artificial planning techniques with fuzzy logic approaches for the control of local motion and perception actions are presented. Also formulations of dynamic programming approaches to optimal control in the context of the analysis of approximate models of the real world are examined. Also a new approach to goal conflict resolution that does not require specification of numerical values representing relative goal importance is reviewed. Applied developments include the introduction of the notion of approximate map. A fuzzy relational database structure for the representation of vague and imprecise information about the robot's environment is proposed. Also the central notions of control point and control structure are discussed. Author (revised)

A FUZZY LOGIC CONTROLLER FOR AN AUTONOMOUS MOBILE ROBOT Abstract Only

John Yen and Nathan Pfluger *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 2 Jan. 1993 p 344-345 (For primary document see N93-22206 08-63)

Avail: CASI HC A01/MF A02

The ability of a mobile robot system to plan and move intelligently in a dynamic system is needed if robots are to be useful in areas other than controlled environments. An example of a use for this system is to control an autonomous mobile robot in a space station, or other isolated area where it is hard or impossible for human life to exist for long periods of time (e.g., Mars). The system would allow the robot to be programmed to carry out the duties normally accomplished by a human being. Some of the duties that could be accomplished include operating instruments, transporting objects, and maintenance of the environment. The main focus of our early work has been on developing a fuzzy controller that takes a path and adapts it to a given environment. The robot only uses information gathered from the sensors, but retains the ability to avoid dynamically placed obstacles near and along the path. Our fuzzy logic controller is based on the following algorithm: (1) determine the desired direction of travel; (2) determine the allowed direction of travel; and (3) combine the desired and allowed directions in order to determine a direciton that is both desired and allowed. The desired direction of travel is determined by projecting ahead to a point along the path that is closer to the goal. This gives a local direction of travel for the robot and helps to avoid obstacles. Author (revised)

INTELLIGENT NEUROPROCESSORS FOR IN-SITU LAUNCH VEHICLE PROPULSION SYSTEMS HEALTH MANAGEMENT Abstract Only

S. Gulati, R. Tawel, and A. P. Thakoor *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 2 Jan. 1993 p 346-347 (For primary document see N93-22206 08-63)

Avail: CASI HC A01/MF A02

Efficacy of existing on-board propulsion systems health management systems (HMS) are severely impacted by computational limitations (e.g., low sampling rates); paradigmatic limitations (e.g., low-fidelity logic/parameter redlining only, false alarms due to noisy/corrupted sensor signatures, preprogrammed diagnostics only); and telemetry bandwidth limitations on space/ground interactions. Ultra-compact/light, adaptive neural networks with massively parallel, asynchronous, fast reconfigurable and fault-tolerant information processing properties have already demonstrated significant potential for inflight diagnostic analyses and resource allocation with reduced ground dependence. In particular, they can automatically exploit correlation effects across multiple sensor streams (plume analyzer, flow meters, vibration detectors, etc.) so as to detect anomaly signatures that cannot be determined from the exploitation of single sensor. Furthermore, neural networks have already demonstrated the potential for impacting real-time fault recovery in vehicle subsystems by adaptively regulating combustion mixture/power subsystems and optimizing resource utilization under degraded conditions. A class of high-performance neuroprocessors, developed at JPL, that have demonstrated potential for next-generation HMS for a family of space transportation vehicles envisioned for the next few decades, including HLLV, NLS, and space shuttle is presented. Of fundamental interest are intelligent neuroprocessors for real-time plume analysis, optimizing combustion mixture-ratio, and feedback to hydraulic, pneumatic control systems. This class includes concurrently asynchronous reprogrammable, nonvolatile, analog neural processors with high speed, high bandwidth electronic/optical I/O interfaced, with special emphasis on NASA's unique requirements in terms of performance, reliability, ultra-high density ultra-compactness, ultra-light weight devices, radiation hardened devices, power stringency, and long life terms. SYNTHESIS OF NONLINEAR CONTROL STRATEGIES FROM FUZZY LOGIC CONTROL ALGORITHMS

Reza Langari *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 2 Jan. 1993 p 348-353 (For primary document see N93-22206 08-63)

Avail: CASI HC A02/MF A02

Fuzzy control has been recognized as an alternative to conventional control techniques in situations where the plant model is not sufficiently well known to warrant the application of conventional control techniques. Precisely what fuzzy control does and how it does what it does is not quite clear, however. This important issue is discussed and in particular it is shown how a given fuzzy control scheme can resolve into a nonlinear control law and that in those situations the success of fuzzy control hinges on its ability to compensate for nonlinearities in plant dynamics. TRUTH-VALUED-FLOW INFERENCE (TVFI) AND ITS APPLICATIONS IN APPROXIMATE REASONING

Pei-Zhuang Wang (Beijing Normal Univ., China.), Hongmin Zhang (Aptronix Fuzzy Logic Technology Co., San Jose, CA.), and Wei Xu (Aptronix Fuzzy Logic Technology Co., San Jose, CA.) *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 2 Jan. 1993 p 354-367 (For primary document see N93-22206 08-63)

Avail: CASI HC A03/MF A02

The framework of the theory of Truth-valued-flow Inference (TVFI) is introduced. Even though there are dozens of papers presented on fuzzy reasoning, we think it is still needed to explore a rather unified fuzzy reasoning theory which has the following two features: (1) it is simplified enough to be executed feasibly and easily; and (2) it is well structural and well consistent enough that it can be built into a strict mathematical theory and is consistent with the theory proposed by L.A. Zadeh. TVFI is one of the fuzzy reasoning theories that satisfies the above two features. It presents inference by the form of networks, and naturally views inference as a process of truth values flowing among propositions. Author (revised)

Over the last few years we have seen an increasing number of applications of Fuzzy Logic Controllers. These applications range from the development of auto-focus cameras, to the control of subway trains, cranes, automobile subsystems (automatic transmissions), domestic appliances, and various consumer electronic products. In summary, we consider a Fuzzy Logic Controller to be a high level language with its local semantics, interpreter, and compiler, which enables us to quickly synthesize non-linear controllers for dynamic systems. EFFICIENTLY MODELING NEURAL NETWORKS ON MASSIVELY PARALLEL COMPUTERS

Robert M. Farber *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 1 Jan. 1993 p 3-12 Prepared in cooperation with Santa Fe Inst., NM (For primary document see N93-22351 08-63)

(Grant GM-40789-03)

Avail: CASI HC A02/MF A03

Neural networks are a very useful tool for analyzing and modeling complex real world systems. Applying neural network simulations to real world problems generally involves large amounts of data and massive amounts of computation. To efficiently handle the computational requirements of large problems, we have implemented at Los Alamos a highly efficient neural network compiler for serial computers, vector computers, vector parallel computers, and fine grain SIMD computers such as the CM-2 connection machine. This paper describes the mapping used by the compiler to implement feed-forward backpropagation neural networks for a SIMD (Single Instruction Multiple Data) architecture parallel computer. Thinking Machines Corporation has benchmarked our code at 1.3 billion interconnects per second (approximately 3 gigaflops) on a 64,000 processor CM-2 connection machine (Singer 1990). This mapping is applicable to other SIMD computers and can be implemented on MIMD computers such as the CM-5 connection machine. Our mapping has virtually no communications overhead with the exception of the communications required for a global summation across the processors (which has a sub-linear runtime growth on the order of O(log(number of processors)). We can efficiently model very large neural networks which have many neurons and interconnects and our mapping can extend to arbitrarily large networks (within memory limitations) by merging the memory space of separate processors with fast adjacent processor interprocessor communications. This paper will consider the simulation of only feed forward neural network although this method is extendable to recurrent networks.

LEARNING FUZZY INFORMATION IN A HYBRID CONNECTIONIST, SYMBOLIC MODEL

Steve G. Romaniuk and Lawrence O. Hall *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 1 Jan. 1993 p 13-29 (For primary document see N93-22351 08-63)

Avail: CASI HC A03/MF A03

An instance-based learning system is presented. SC-net is a fuzzy hybrid connectionist, symbolic learning system. It remembers some examples and makes groups of examples into exemplars. All real-valued attributes are represented as fuzzy sets. The network representation and learning method is described. To illustrate this approach to learning in fuzzy domains, an example of segmenting magnetic resonance images of the brain is discussed. Clearly, the boundaries between human tissues are ill-defined or fuzzy. Example fuzzy rules for recognition are generated. Segmentations are presented that provide results that radiologists find useful. Author

A FUZZY CONTROLLER WITH NONLINEAR CONTROL RULES IS THE SUM OF A GLOBAL NONLINEAR CONTROLLER AND A LOCAL NONLINEAR PI-LIKE CONTROLLER

Hao Ying *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 1 Jan. 1993 p 40-47 (For primary document see N93-22351 08-63)

Avail: CASI HC A02/MF A03

The fuzzy controllers studied in this paper are the ones that employ N trapezoidal-shaped members for input fuzzy sets, Zadeh fuzzy logic and a centroid defuzzification algorithm for output fuzzy set. The author analytically proves that the structure of the fuzzy controllers is the sum of a global nonlinear controller and a local nonlinear proportional-integral-like controller. If N approaches infinity, the global controller becomes a nonlinear controller while the local controller disappears. If linear control rules are used, the global controller becomes a global two-dimensional multilevel relay which approaches a global linear proportional-integral (PI) controller as N approaches infinity. FUZZY CONTROL OF SMALL SERVO MOTORS Abstract Only

Ron Maor and Yashvant Jani *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 1 Jan. 1993 p 48 (For primary document see N93-22351 08-63)

Avail: CASI HC A01/MF A03

To explore the benefits of fuzzy logic and understand the differences between the classical control methods and fuzzy control methods, the Togai InfraLogic applications engineering staff developed and implemented a motor control system for small servo motors. The motor assembly for testing the fuzzy and conventional controllers consist of servo motor RA13M and an encoder with a range of 4096 counts. An interface card was designed and fabricated to interface the motor assembly and encoder to an IBM PC. The fuzzy logic based motor controller was developed using the TILShell and Fuzzy C Development System on an IBM PC. A Proportional-Derivative (PD) type conventional controller was also developed and implemented in the IBM PC to compare the performance with the fuzzy controller. Test cases were defined to include step inputs of 90 and 180 degrees rotation, sine and square wave profiles in 5 to 20 hertz frequency range, as well as ramp inputs. In this paper we describe our approach to develop a fuzzy as well as PH controller, provide details of hardware set-up and test cases, and discuss the performance results. In comparison, the fuzzy logic based controller handles the non-linearities of the motor assembly very well and provides excellent control over a broad range of parameters. Fuzzy technology, as indicated by our results, possesses inherent adaptive features. Author

A HIERARCHICAL STRUCTURE FOR REPRESENTING AND LEARNING FUZZY RULES
Ronald R. Yager *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 1 Jan. 1993 p 49-53 (For primary document see N93-22351 08-63)
Avail: CASI HC A01/MF A03

Yager provides an example in which the flat representation of fuzzy if-then rules leads to unsatisfactory results. Consider a rule base consisting to two rules: if U is 12 the V is 29; if U is (10-15) the V is (25-30). If U = 12 we would get V is G where G = (25-30). The application of the defuzzification process leads to a selection of V = 27.5. Thus we see that the very specific instruction was not followed. The problem with the technique used is that the most specific information was swamped by the less specific information. In this paper we shall provide for a new structure for the representation of fuzzy if-then rules. The representational form introduced here is called a Hierarchical Prioritized Structure (HPS) representation. Most importantly in addition to overcoming the problem illustrated in the previous example this HPS representation has an inherent capability to emulate the learning of general rules and provides a reasonable accurate cognitive mapping of how human beings store information.

Uncertainty may be caused by the ambiguity in the terms used to describe a specific situation. It may also be caused by skepticism of rules used to describe a course of action or by missing and/or erroneous data. To deal with uncertainty, techniques other than classical logic need to be developed. Although, statistics may be the best tool available for handling likelihood, it is not always adequate for dealing with knowledge acquisition under uncertainty. Inadequacies caused by estimating probabilities in statistical processes can be alleviated through use of the Dempster-Shafer theory of evidence. Fuzzy set theory is another tool used to deal with uncertainty where ambiguous terms are present. Other methods include rough sets, the theory of endorsements and nonmonotonic logic. J. Grzymala-Busse has defined the concept of lower and upper approximation of a (crisp) set and has used that concept to extract rules from a set of examples. We will define the fuzzy analogs of lower and upper approximations and use these to obtain certain and possible rules from a set of examples where the data is fuzzy. Central to these concepts will be the idea of the degree to which a fuzzy set A is contained in another fuzzy set B, and the degree of intersection of a set A with set B. These concepts will also give meaning to the statement; A implies B. The two meanings will be: (1) if x is certainly in A then it is certainly in B, and (2) if x is possibly in A then it is possibly in B. Next, classification will be looked at and it will be shown that if a classification will be looked at and it will be shown that if a classification is well externally definable then it is well internally definable, and if it is poorly externally definable then it is poorly internally definable, thus generalizing a result of Grzymala-Busse. Finally, some ideas of how to define consensus and group options to form clusters of rules will be given.

Since the pioneering work of Zadeh and Mamdani and Assilian, fuzzy logic control has emerged as one of the most active and fruitful research areas. The applications of fuzzy logic control can be found in many fields such as control of stream generators, automatic train operation systems, elevator control, nuclear reactor control, automobile transmission control, etc. In this paper, two new structures of hierarchical fuzzy rule-based controller are proposed to reduce the number of rules in a complete rule set of a controller. In one approach, the overall system is split into sub-systems which are treated independently in parallel. A coordinator is then used to take into account the interactions. This is done via an iterating information exchange between the lower level and the coordinator level. From the point of view of information used, this structure is very similar to central structure in that the coordinator can have at least in principle, all the information that the local controllers have.

ROBUST ALGEBRAIC IMAGE ENHANCEMENT FOR INTELLIGENT CONTROL SYSTEMS Abstract Only
Bao-Ting Lerner and Michael Morrelli (Texas Technological Univ., Lubbock.) *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 1 Jan. 1993 p 73-74 (For primary document see N93-22351 08-63)

Robust vision capability for intelligent control systems has been an elusive goal in image processing. The computationally intensive techniques a necessary for conventional image processing make real-time applications, such as object tracking and collision avoidance difficult. In order to endow an intelligent control system with the needed vision robustness, an adequate image enhancement subsystem capable of compensating for the wide variety of real-world degradations, must exist between the image capturing and the object recognition subsystems. This enhancement stage must be adaptive and must operate with consistency in the presence of both statistical and shape-based noise. To deal with this problem, we have developed an innovative algebraic approach which provides a sound mathematical framework for image representation and manipulation. Our image model provides a natural platform from which to pursue dynamic scene analysis, and its incorporation into a vision system would serve as the front-end to an intelligent control system. We have developed a unique polynomial representation of gray level imagery and applied this representation to develop polynomial operators on complex gray level scenes. This approach is highly advantageous since polynomials can be manipulated very easily, and are readily understood, thus providing a very convenient environment for image processing. Our model presents a highly structured and compact algebraic representation of grey-level images which can be viewed as fuzzy sets.

DESIGN ISSUES FOR A REINFORCEMENT-BASED SELF-LEARNING FUZZY CONTROLLER Abstract Only
John Yen, Haojin Wang, and Walter Dauherity *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 1 Jan. 1993 p 75 (For primary document see N93-22351 08-63)
Avail: CASI HC A01/MF A03

Fuzzy logic controllers have some often cited advantages over conventional techniques such as PID control: easy implementation, its accommodation to natural language, the ability to cover wider range of operating conditions and others. One major obstacle that hinders its broader application is the lack of a systematic way to develop and modify its rules and as result the creation and modification of fuzzy rules often depends on try-error or pure experimentation. One of the proposed approaches to address this issue is self-learning fuzzy logic controllers (SFLC) that use reinforcement learning techniques to learn the desirability of states and to adjust the consequent part of fuzzy control rules accordingly. Due to the different dynamics of the controlled processes, the performance of self-learning fuzzy controller is highly contingent on the design. The design issue has not received sufficient attention. The issues related to the design of a SFLC for the application to chemical process are discussed and its performance is compared with that of PID and self-tuning fuzzy logic controller.

This paper describes the early states of work to implement a fuzzy logic controller to optimize the efficiency of AC induction motor/adjustable speed drive (ASD) systems running at less than optimal speed and torque conditions. In this paper, the process by which the membership functions of the controller were tuned is discussed and a controller which operates on frequency as well as voltage is proposed. The membership functions for this dual-variable controller are sketched. Additional topics include an approach for fuzzy logic to motor current control which can be used with vector-controlled drives. Incorporation of a fuzzy controller as an application-specific integrated circuit (ASIC) microchip is planned. Author

The real world consists of a very large number of instances of events and continuous numeric values. On the other hand, people represent and process their knowledge in terms of abstracted concepts derived from generalization of these instances and numeric values. Logic based paradigms for knowledge representation use symbolic processing both for concept representation and inference. Their underlying assumption is that a concept can be defined precisely. However, as this assumption hardly holds for natural concepts, it follows that symbolic processing cannot deal with such concepts. Thus symbolic processing has essential problems from a practical point of view of applications in the real world. In contrast, fuzzy set theory can be viewed as a stronger and more practical notation than formal, logic based theories because it supports both symbolic processing and numeric processing, connecting the logic based world and the real world. In this paper, we propose multi-layered reasoning by using conceptual fuzzy sets (CFS). The general characteristics of CFS are discussed along with upper layer supervision and context dependent processing.

This paper discusses an application of fuzzy control to an unmanned helicopter. The authors design a fuzzy controller to achieve semi-autonomous flight of a helicopter by giving macroscopic flight commands from the ground. The fuzzy controller proposed in this study consists of two layers: the upper layer for navigation supervising the lower layer and the lower layer for ordinary rule based control. The performance of the fuzzy controller is evaluated in experiments where an industrial helicopter Yamaha R-50 is used. At present an operator can wirelessly control the helicopter through a flight computer with eight commands such as 'hover', 'fly forward', 'turn left', 'stop', etc. Author (revised)

FUZZY LOGIC MODE SWITCHING IN HELICOPTERS Abstract Only
Porter D. Sherman and Frank W. Warburton *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 1 Jan. 1993 p 108 (For primary document see N93-22351 08-63)
Avail: CASI HC A01/MF A03

The application of fuzzy logic to a wide range of control problems has been gaining momentum internationally, fueled by a concentrated Japanese effort. Advanced Research & Development within the Engineering Department at Sikorsky Aircraft undertook a fuzzy logic research effort designed to evaluate how effective fuzzy logic control might be in relation to helicopter operations. The mode switching module in the advanced flight control portion of Sikorsky's motion based simulator was identified as a good candidate problem because it was simple to understand and contained imprecise (fuzzy) decision criteria. The purpose of the switching module is to aid a helicopter pilot in entering and leaving coordinated turns while in flight. The criteria that determine the transitions between modes are imprecise and depend on the varied ranges of three flight conditions (i.e., simulated parameters): Commanded Rate, Duration, and Roll Attitude. The parameters were given fuzzy ranges and used as input variables to a fuzzy rulebase containing the knowledge of mode switching. The fuzzy control program was integrated into a real time interactive helicopter simulation tool. Optimization of the heading hold and turn coordination was accomplished by interactive pilot simulation testing of the handling quality performance of the helicopter dynamic model. The fuzzy logic code satisfied all the requirements of this candidate control problem.

Avail: CASI HC A01/MF A03

A flight control concept that can identify aircraft stability properties and continually optimize the aircraft flying qualities has been developed by McDonnell Aircraft Company under a contract with the NASA-Dryden Flight Research Facility. This flight concept, termed the Intelligent Flight Control System, utilizes Neural Network technology to identify the host aircraft stability and control properties during flight, and use this information to design on-line the control system feedback gains to provide continuous optimum flight response. This self-repairing capability can provide high performance flight maneuvering response throughout large flight envelopes, such as needed for the National Aerospace Plane. Moreover, achieving this response early in the vehicle's development schedule will save cost.

A space shuttle flight scheduled for 1992 will attempt to prove the feasibility of operating tethered payloads in earth orbit. due to the interaction between the Earth's magnetic field and current pulsing through the tether, the tethered system may exhibit a circular transverse oscillation referred to as the 'skiprope' phenomenon. Effective damping of skiprope motion depends on rapid and accurate detection of skiprope magnitude and phase. Because of non-linear dynamic coupling, the satellite attitude behavior has characteristic oscillations during the skiprope motion. Since the satellite attitude motion has many other perturbations, the relationship between the skiprope parameters and attitude time history is very involved and non-linear. We propose a Space-Time Neural Network implementation for filtering satellite rate gyro data to rapidly detect and predict skiprope magnitude and phase. Training and testing of the skiprope detection system will be performed using a validated Orbital Operations Simulator and Space-Time Neural Network software developed in the Software Technology Branch at NASA's Lyndon B. Johnson Space Center. Author (revised)

In our previous work on the GARIC architecture, we have shown that the system can start with surface structure of the knowledge base (i.e., the linguistic expression of the rules) and learn the deep structure (i.e., the fuzzy membership functions of the labels used in the rules) by using reinforcement learning. Assuming the surface structure, GARIC refines the fuzzy membership functions used in the consequents of the rules using a gradient descent procedure. This hybrid fuzzy logic and reinforcement learning approach can learn to balance a cart-pole system and to backup a truck to its docking location after a few trials. In this paper, we discuss how to do structure identification using reinforcement learning in fuzzy inference systems. This involves identifying both surface as well as deep structure of the knowledge base. The term set of fuzzy linguistic labels used in describing the values of each control variable must be derived. In this process, splitting a label refers to creating new labels which are more granular than the original label and merging two labels creates a more general label. Splitting and merging of labels directly transform the structure of the action selection network used in GARIC by increasing or decreasing the number of hidden layer nodes. Author (revised)

Traditional control theory is well-developed mainly for linear control situations. In non-linear cases there is no general method of generating a good control, so we have to rely on the ability of the experts (operators) to control them. If we want to automate their control, we must acquire their knowledge and translate it into a precise control strategy. The experts' knowledge is usually represented in non-numeric terms, namely, in terms of uncertain statements of the type 'if the obstacle is straight ahead, the distance to it is small, and the velocity of the car is medium, press the brakes hard'. Fuzzy control is a methodology that translates such statements into precise formulas for control. The necessary first step of this strategy consists of assigning membership functions to all the terms that the expert uses in his rules (in our sample phrase these words are 'small', 'medium', and 'hard'). The appropriate choice of a membership function can drastically improve the quality of a fuzzy control. In the simplest cases, we can take the functions whose domains have equally spaced endpoints. Because of that, many software packages for fuzzy control are based on this choice of membership functions. This choice is not very efficient in more complicated cases. Therefore, methods have been developed that use neural networks or generic algorithms to 'tune' membership functions. But this tuning takes lots of time (for example, several thousands iterations are typical for neural networks). In some cases there are evident physical reasons why equally space domains do not work: e.g., if the control variable u is always positive (i.e., if we control temperature in a reactor), then negative values (that are generated by equal spacing) simply make no sense. In this case it sounds reasonable to choose another scale u' = f(u) to represent u, so that equal spacing will work fine for u'. In the present paper we formulate the problem of finding the best rescaling function, solve this problem, and show (on a real-life example) that after an optimal rescaling, the un-tuned fuzzy control can be as good as the best state-of-art traditional non-linear controls. The design of neural networks and fuzzy systems can involve complex, nonlinear, and ill-conditioned optimization problems. Often, traditional optimization schemes are inadequate or inapplicable for such tasks. Genetic Algorithms (GA's) are a class of optimization procedures whose mechanics are based on those of natural genetics. Mathematical arguments show how GAs bring substantial computational leverage to search problems, without requiring the mathematical characteristics often necessary for traditional optimization schemes (e.g., modality, continuity, availability of derivative information, etc.). GA's have proven effective in a variety of search tasks that arise in neural networks and fuzzy systems. This presentation begins by introducing the mechanism and theoretical

underpinnings of GA's. GA's are then related to a class of rule-based machine learning systems called learning classifier systems (LCS's). An LCS implements a low-level production-system that uses a GA as its primary rule discovery mechanism. This presentation illustrates how, despite its rule-based framework, an LCS can be thought of as a competitive neural network. Neural network simulator code for an LCS is presented. In this context, the GA is doing more than optimizing and objective function. It is searching for an ecology of hidden nodes with limited connectivity. The GA attempts to evolve this ecology such that effective neural network performance results. The GA is particularly well adapted to this task, given its naturally-inspired basis. The LCS/neural network analogy extends itself to other, more traditional neural networks. Conclusions to the presentation discuss the implications of using GA's in ecological search problems that arise in neural and fuzzy systems. Author

EVOLVING FUZZY RULES IN A LEARNING CLASSIFIER SYSTEM
Manuel Valenzuela-Rendon *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 1 Jan. 1993 p 184-185 (For primary document see N93-22351 08-63)
Avail: CASI HC A01/MF A03

The fuzzy classifier system (FCS) combines the ideas of fuzzy logic controllers (FLC's) and learning classifier systems (LCS's). It brings together the expressive powers of fuzzy logic as it has been applied in fuzzy controllers to express relations between continuous variables, and the ability of LCS's to evolve co-adapted sets of rules. The goal of the FCS is to develop a rule-based system capable of learning in a reinforcement regime, and that can potentially be used for process control. Derived from text

ADAPTIVE PROCESS CONTROL USING FUZZY LOGIC AND GENETIC ALGORITHMS
C. L. Karr *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 1 Jan. 1993 p 186-193 (For primary document see N93-22351 08-63)
Avail: CASI HC A02/MF A03

Researchers at the U.S. Bureau of Mines have developed adaptive process control systems in which genetic algorithms (GA's) are used to augment fuzzy logic controllers (FLC's). GA's are search algorithms that rapidly locate near-optimum solutions to a wide spectrum of problems by modeling the search procedures of natural genetics. FLC's are rule based systems that efficiently manipulate a problem environment by modeling the 'rule-of-thumb' strategy used in human decision making. Together, GA's and FLC's possess the capabilities necessary to produce powerful, efficient, and robust adaptive control systems. To perform efficiently, such control systems require a control element to manipulate the problem environment, and a learning element to adjust to the changes in the problem environment. Details of an overall adaptive control system are discussed. A specific laboratory acid-base pH system is used to demonstrate the ideas presented. Author (revised)

The issue of designing and tuning fuzzy membership functions by neural networks (NN's) was started by NN-driven Fuzzy Reasoning in 1988. NN-driven fuzzy reasoning involves a NN embedded in the fuzzy system which generates membership values. In conventional fuzzy system design, the membership functions are hand-crafted by trial and error for each input variable. In contrast, NN-driven fuzzy reasoning considers several variables simultaneously and can design a multidimensional, nonlinear membership function for the entire subspace. Derived from text

IMPROVEMENT ON FUZZY CONTROLLER DESIGN TECHNIQUES Abstract Only
Paul P. Wang *In* NASA. Johnson Space Center, Proceedings of the Third International Workshop on Neural Networks and Fuzzy Logic, Volume 1 Jan. 1993 p 196 (For primary document see N93-22351 08-63)
Avail: CASI HC A01/MF A03

This paper addresses three main issues, which are somewhat interrelated. The first issue deals with the classification or types of fuzzy controllers. Careful examination of the fuzzy controllers designed by various engineers reveals distinctive classes of fuzzy controllers. Classification is believed to be helpful from different perspectives. The second issue deals with the design according to specifications, experiments related to the tuning of fuzzy controllers, according to the specification, will be discussed. General design procedure, hopefully, can be outlined in order to ease the burden of a design engineer. The third issue deals with the simplicity and limitation of the rule-based IF-THEN logical statements. The methodology of fuzzy-constraint network is proposed here as an alternative to the design practice at present. It is our belief that predicate calculus and the first order logic possess much more expressive power. Author (revised)

The reinforcement learning techniques developed at Ames Research Center are being applied to proximity and docking operations using the Shuttle and Solar Maximum Mission (SMM) satellite simulation. In utilizing these fuzzy learning techniques, we also use the Approximate Reasoning based Intelligent Control (ARIC) architecture, and so we use two terms interchangeable to imply the same. This activity is carried out in the Software Technology Laboratory utilizing the Orbital Operations Simulator (OOS). This report is the deliverable D3 in our project activity and provides the test results of the fuzzy learning translational controller. This report is organized in six sections. Based on our experience and analysis with the attitude controller, we have modified the basic configuration of the reinforcement learning algorithm in ARIC as described in section 2. The shuttle translational controller and its implementation in fuzzy learning architecture is described in section 3. Two test cases that we have performed are described in section 4. Our results and conclusions are discussed in section 5, and section 6 provides future plans and summary for the project. Author

PATH PLANNING FOR MANIPULATORS
P. C. Chen 1992 8 p Presented at the 5th Topical Meeting on Robotics and Remote Systems, Knoxville, TN, 26-29 Apr. 1993
(Contract DE-AC04-76DP-00789)
(DE93-004050; SAND-92-1437C; CONF-930403-6) Avail: CASI HC A02/MF A01

To facilitate robot programming, three different path planners with complementary capabilities are presented. The first planner uses SANDROS, a new search strategy that combines hierarchical, nonuniform-multi-resolution, and best-first search to find a near-optimal solution in the configuration space. It is an efficient and resolution-complete algorithm that has performance commensurate with task difficulty. The second planner uses a simpler path planning algorithm based on a series of plausible task restrictions. It is designed to solve 'realistic' problems very quickly, at the expense of not being able to solve every problem. Finally, the third planner uses a learning algorithm designed to improve path planning. The learning algorithm not only reduces the time cost of existing planners, but also increases their capability in solving difficult tasks. DOE

The problem of identifying a system in such a way that the identification result is suited to serve as a basis for the design of a robust controller, and that guarantees can be given on the stability and performance of the closed loop system, is addressed. Attention is restricted to exponentially stable finite dimensional linear time invariant discrete time systems in combination with the H infinity design methodology for designing robust controllers. The basic problem is stated, analyzed and detailed, leading to a set of requirements on and desirable properties of the identification method. The advantages and disadvantages of the basic approaches to the problem, stochastic or deterministic, and time or frequency domain, are analyzed. Preliminaries and a survey of literature are given. Based on the foregoing, the deterministic frequency domain approach to the problem is chosen. The problems present in this approach are discussed and some promising possibilities to solve these problems are presented. ESA

APPLICATION OF FUZZY LOGIC-NEURAL NETWORK BASED REINFORCEMENT LEARNING TO PROXIMITY AND DOCKING OPERATIONS: ATTITUDE CONTROL RESULTS Report, 1 May - 30 Jun. 1992
Yashvant Jani (Togai InfraLogic, Inc., Houston, TX.) 10 Jul. 1992 496 p
(Contract NCC9-16; RICIS Proj. AR-06)
(NASA-CR-192291; NAS 1.26:192291) Avail: CASI HC A21/MF A04

As part of the RICIS activity, the reinforcement learning techniques developed at Ames Research Center are being applied to proximity and docking operations using the Shuttle and Solar Max satellite simulation. This activity is carried out in the software technology laboratory utilizing the Orbital Operations Simulator (OOS). This report is deliverable D2 Altitude Control Results and provides the status of the project after four months of activities and outlines the future plans. In section 2 we describe the Fuzzy-Learner system for the attitude control functions. In section 3, we provide the description of test cases and results in a chronological order. In section 4, we have summarized our results and conclusions. Our future plans and recommendations are provided in section 5. Author

ADAPTIVE CONTROL OF A FLEXIBLE MANIPULATOR Ph.D. Thesis
Ki-Hyun Sung 1992 197 p
Avail: Univ. Microfilms Order No. DA9234668

This research is concerned with the control of the tip position of a flexible manipulator carrying variable payload. The tip of the manipulator considered here has three degrees of freedom, viz, one rotational and two translational. The desired rotational motion is the result of a command whereas the undesired translational motions are due to the deflection caused by the payload. For this work, these three motions are decoupled since the flexible manipulator does not move simultaneously and that the translational motions are much smaller compared to the rotational motion. A self-tuning adaptive control was chosen to control the rotational motion whereas a conventional PID control was sufficient for the control of two translation motions. As a first step in developing a self-tuning control system, a single link flexible manipulator was experimentally investigated. From these tests, it was found that the dynamic behavior of a single link flexible manipulator can be adequately modeled with just one mode shape. Such a dynamic equation results in a fourth order linear model. A recursive least square algorithm was used to identify the parameters. Numerical problems of the algorithm were overcome by introducing a scale factor and a time varying forgetting factor. The self-tuning control algorithm associated with the modified parameter estimation scheme was implemented with the 'selspot' system to control the rotational motion of the tip of the flexible manipulator. For the remaining two translational motions, the PID control algorithms were developed and fine tuned. The resulting control system was evaluated by performing analytical simulations. Also, simulation was conducted to study the relative merits of using different geometry for the flexible manipulator. Three different types of flexible manipulator, viz, rectangular cross-sectional beam, circular cross-sectional beam, and I-section beam were considered. The I-section beam was found to be superior with its fastest cycle time in the theta and the z-axis motions. The overall simulation results demonstrated the ability of the developed control system to maneuver the flexible manipulator so that the tip reaches the target position accurately under varying payloads. Dissert. Abstr.

GOAL DIRECTED ROBOT NAVIGATION IN A KNOWN INDOOR ENVIRONMENT WITH UNKNOWN STATIONARY AND MOVING OBSTACLES Ph.D. Thesis
Steven James Ratering 1992 129 p
Avail: Univ. Microfilms Order No. DA9236972

Robot navigation is difficult even in known environments because of the almost unavoidable presence of unknown obstacles. A new type of artificial potential field used to navigate a robot in situations in which the environment is known except for unknown and possibly moving obstacles is proposed. The potential field is called a hybrid potential field because it is composed of a static global artificial potential field which pulls the robot to the goal and a dynamic local artificial potential field which pushes the robot away from obstacles. The causes of local minima in hybrid potential fields are determined and methods for getting out of these minima are proposed. It is shown how to compute hybrid potential fields in real time and how to use them to control the motions of a real robot. The method is tested on both a simulated robot and a real one. Extensive simulation results with up to fifty randomly moving obstacles were determined. Dissert. Abstr.

A STOCHASTIC LEARNING ALGORITHM FOR LAYERED NEURAL NETWORKS
E. B. Bartlett (Iowa State Univ. of Science and Technology, Ames.) and R. E. Uhrig 1992 7 p Presented at the WNN-92: Workshop on Neural Networks, Alburn, AL, 10-12 Feb. 1992
(Contract DE-FG07-88ER-12824)
(DE93-003555; CONF-9202142-2) Avail: CASI HC A02/MF A01

The random optimization method typically uses a Gaussian probability density function (PDF) to generate a random search vector. In this paper the random search technique is applied to the neural network training problem and is modified to dynamically seek out the optimal probability density function (OPDF) from which to select the search vector. The dynamic OPDF search process, combined with an auto-adaptive stratified sampling technique and a dynamic node architecture (DNA) learning scheme, completes the modifications of the basic method. The DNA technique determines the appropriate number of hidden nodes needed for a given training problem. By using DNA, researchers do not have to set the neural network architectures before training is initiated. The approach is applied to networks of generalized, fully interconnected, continuous perceptions. Computer simulation results are given. DOE

TIME OPTIMAL PATHS FOR HIGH SPEED MANEUVERING
D. B. Reister and S. M. Lenhart Jan. 1993 38 p
(Contract DE-AC05-84OR-21400)
(DE93-006251; ORNL/TM-12289) Avail: CASI HC A03/MF A01

Recent theoretical results have completely solved the problem of determining the minimum length path for a vehicle with a minimum turning radius moving from an initial configuration to a final configuration. Time optimal paths for a constant speed vehicle are a subset of the minimum length paths. The Pontryagin maximum principle is used to find time optimal paths for a constant speed vehicle. The time optimal paths consist of sequences of axes of circles and straight lines. The maximum principle introduces concepts (dual variables, bang-bang solutions, singular solutions, and transversality conditions) that provide important insight into the nature of the time optimal paths. The properties of the optimal paths are explored and some experimental results for a mobile robot following an optimal path are presented. DOE

A PASSIVITY APPROACH TO CONTROLLER-OBSERVER DESIGN FOR ROBOTS

Harry Berghuis and H. Nijmeijer Apr. 1992 34 p Sponsored by Netherlands Technology Foundation

(MEMO-1050; ETN-93-93190) Avail: CASI HC A03/MF A01

A design procedure that utilizes the passivity concept in order to develop combined controller observer systems for robot motion control using position measurements only is proposed. To this end, a desired energy function for the closed loop system is introduced, and the controller observer combination is constructed such that the closed loop system matches this energy function, whereas damping is included in the controller observer system to assure asymptotic stability of the closed loop system. A key point in this design procedure is a fine tuning of the controller and observer structure to each other, which provides solutions to the output feedback robot control problem that are conceptually simple and easily implementable in industrial robot applications. Performance issues of the overall control systems are illustrated in a simulation study of a two degrees of freedom robot manipulator. ESA

A SELF GROWING BINARY TREE NEURAL NETWORK FOR THE IDENTIFICATION OF MULTICLASS SYSTEMS

K. M. Tsang (Hong Kong Polytechnic, Kowloon.) and S. A. Billings Mar. 1992 29 p

(RR-451; ETN-93-93492) Avail: CASI HC A03/MF A01

A self growing binary tree neural network is introduced for the online identification of multiclass systems. Instead of solving the traditional two class problem with a single neuron a time shrinking threshold logic unit is introduced such that the modified neuron has the capability of partitioning the raw data records into three different regions. Incorporating a least mean squares learning algorithm provides the capability of detecting and creating new classes and this allows clustering and partitioning of the raw data records into model classes and yields estimates of the parameters. The models which describe the behavior of the system at different operating regions can be recovered by inspection of the connection weights of the individual neurons. Optimization procedures for online estimation are proposed. Simulation studies are included to illustrate the concepts. ESA

AUTONOMUS OBSTACLE AVOIDANCE USING VISUAL FIXATION AND LOOMING

Kunal Joarder and Daniel Raviv Dec. 1992 27 p Sponsored by National Inst. of Standards and Technology, Gaithersburg, MD

(PB93-146660; NISTIR-4996) Avail: CASI HC A03/MF A01

The paper describes a vision-based method for avoiding obstacles using the concepts of visual looming and fixating motion. Visual looming refers to the expansion of images of objects in the retina. Usually, this is due to the decreasing distance between the observer and the object. An increasing looming value signifies an increasing threat of collision with the object. The visual task of avoiding collision can be further simplified by purposive control of visual fixation at the objects in front of the moving camera. Using these two basic concepts, real time obstacle avoidance in a tight perception-action loop is implemented. Three-dimensional space in front of the camera is divided into zones with various degrees of looming-based threat of collision. For each obstacle seen by a fixating camera, looming and its time derivative are calculated directly from the 2D image. Depending on the threat posed by an obstacle, a course change is dictated. This looming based approach is simple, independent of the size of the 3D object and its range, and involves simple quantitative measurements. Results pertinent to a camera on a robot arm navigating between obstacles are presented. GRA

PERCEPTION, SCENE RECONSTRUCTION AND WORLD MODELING FOR UNMANNED UNDERWATER VEHICLES

John Moore, Jr., ed. Jan. 1993 36 p Workshop held in Cambridge, MA, 26-27 Jan. 1993 Sponsored by National Sea Grant Coll. Program, Silver Spring, MD

(PB93-146983; MITSG-92-24; Opportunity Brief-62) Avail: CASI HC A03/MF A01

The workshop addresses the sensory and perceptual issues associated with the operation of intelligent systems in an underwater environment. Topics range from low-level processing, including novel hardware approaches, through the high-level techniques for combining data from multiple sensors and different sensing modalities. Presentations primarily focus on developments in computer algorithms for sensory data processing and representation of an unmanned underwater vehicle's environment, and include: perceptual strategies; physics-based sensing and world modeling; techniques for scene reconstruction; merging data over extended periods of time; target acquisition, recognition, and classification; and the trade-offs between global modeling and task-relative perception. AUTOMATIC ANALYSIS AND SYNTHESIS OF CONTROLLERS FOR DYNAMICAL SYSTEMS BASED ON PHASE-SPACE KNOWLEDGE Ph.D. Thesis

Feng Zhao Sep. 1992 148 p

(Contract N00014-89-J-3202; NSF MIP-90-01651)

(AD-A259491; AI-TR-1385) Avail: CASI HC A07/MF A02

This thesis presents a novel design methodology for the synthesis of automatic controllers, together with a computational environment--the Control Engineer's Workbench--integrating a suite of programs that automatically analyze and design controllers for high-performance, global control of nonlinear systems. This work demonstrates that difficult control synthesis tasks can be automated, using programs that actively exploit and efficiently represent knowledge of nonlinear dynamics and phase space and effectively use the representation to guide and perform the control design. The Control Engineer's Workbench combines powerful numerical and symbolic computations with spatial reasoning techniques. The two major programs in the Workbench--Phase Space Navigator and MAPS--work together to model and reason about the phase-space geometry and topology of a given system, to plan global control reference trajectories, and to navigate the system along the planned trajectories. They use a novel technique of 'flow pipes' to group finite numbers of distinct behaviors into a manageable discrete set that becomes the basis for establishing the reference trajectories. As a demonstration of this approach, I exhibit the automatic design of a non controller for a maghetic levitation system. GRA

KNOWLEDGE-BASED VISION TECHNIQUES FOR THE AUTONOMOUS LAND VEHICLE PROGRAM Final Report, Oct. 1990 - Sep. 1991

Martin A. Fischler and Robert C. Bolles Oct. 1991 65 p

(Contract DACA76-85-C-0004)

(AD-A259801; TEC-0022) Avail: CASI HC A04/MF A01

The goal of this research was to develop techniques for automatically acquiring and representing knowledge about complex cultural and natural environments for such purposes as autonomous navigation, planning, intelligence analysis, and manipulation. The research strategy was to develop representations and techniques for storing (or incrementally learning) semantic and geographic information about a specific geographic area to permit both mission planning and knowledge-based interpretation of sensed data, develop representations for natural and man-made objects, develop techniques to recommend distinctive features of these objects that can be used for recognition purposes, and develop techniques for building three-dimensional descriptions of an environment from data gathered by range or intensity sensors moving through this environment. The accomplishments in these areas are described. Near the end of the original contractual period a new task was added to evaluate the application of the cartographic stereo techniques to ground-level imagery. The strengths and weaknesses of the techniques were characterized, enhanced them based on the insights provided by the evaluation, and then evaluated the resulting systems. The enhancements and the evaluation process are briefly described. GRA

USING RECURRENT NETWORKS FOR DIMENSIONALITY REDUCTION M.S. Thesis

Michael J. Jones Sep. 1992 68 p
(Contracts N00014-89-J-3139; N00014-91-J-4038; DACA76-85-C-0010)
(AD-A259497; AI-TR-1396) Avail: CASI HC A04/MF A01

This thesis explores how recurrent neural networks can be exploited for learning certain high-dimensional mappings. Recurrent networks are shown to be as powerful as Turing machines in terms of the class of functions they can compute. Given this computational power, a natural question to ask is how recurrent networks can be used to simplify the problem of learning from examples. Some researchers have proposed using recurrent networks for learning fixed point mappings that can also be learned on a feedforward network even though learning algorithms for recurrent networks are more complex. An important question is whether recurrent networks provide an advantage over feedforward networks for such learning tasks. The main problem with learning high-dimensional functions is the curse of dimensionality which roughly states that the number of examples needed to learn a function increases exponentially with input dimension. Reducing the dimensionality of the function being learned is therefore extremely advantageous. This thesis proposes a way of avoiding the curse of dimensionality for some problems by using a recurrent network to decompose a high-dimensional function into many lower dimensional functions connected in a feedback loop and then iterating to approximate the high-dimensional function. This idea is then tested on learning a simple image segmentation algorithm given examples of segmented and unsegmented images. GRA

LOCALIZATION AND POSITIONING USING COMBINATIONS OF MODEL VIEWS

Ehud Rivlin and Ronen Basri Jul. 1992 26 p
(AD-A259734; AI-M-1376) Avail: CASI HC A03/MF A01

A method for localization and positioning in an indoor environment is presented. Localization is the act of recognizing the environment, and positioning is the act of computing the exact coordinates of a robot in the environment. The method is based on representing the scene as a set of 2D views and predicting the appearance of views by linear combinations of the model views. The method accurately approximates the appearance of scenes under weak perspective projection. Analysis of this projection as well as experimental results demonstrate that in many cases this approximation is sufficient to accurately describe the scene. When orthographic approximation is invalid, either a larger number of models can be acquired or an iterative solution to account for the perspective distortions can be employed. GRA

3D POSE FROM 3 CORRESPONDING POINTS UNDER WEAK-PERSPECTIVE PROJECTION

T. D. Alter Jul. 1992 43 p
(Contracts DACA76-85-C-0010; N00014-85-K-0124)
(AD-A259737; AI-M-1378) Avail: CASI HC A03/MF A01

Model-based object recognition commonly involves using a minimal set of matched model and image points to compute the pose of the model in image coordinates. Furthermore, recognition systems often rely on the 'weak-perspective' imaging model in place of the perspective imaging model. Computing the pose of a model from three corresponding points under weak-perspective projection is discussed. A new solution to the problem is proposed which, like previous solutions, involves solving a biquadratic equation. Here the biquadratic is motivated geometrically and its solutions, comprised of an actual and a false solution, are interpreted graphically. The final equations take a new form, which lead to a simple expression for the image position of any unmatched model point. GRA

3D OBJECT RECOGNITION: SYMMETRY AND VIRTUAL VIEWS

Thomas Vetter, Tomaso Poggio, and H. Bulthoff Dec. 1992 7 p
(Contracts N00014-89-J-3139; N00014-91-J-4038)
(AD-A259738; AI-M-1409; CBCL-76) Avail: CASI HC A02/MF A01

Many 3D objects in the world around us are strongly constrained. For instance, not only cultural artifacts but also many natural objects are bilaterally symmetric. Human faces are an important case for which bilateral symmetry holds, at least approximatively. Can a priori information about generic constraints of this type help the task of 3D object recognition? It can be shown that theoretically such prior information reduces the amount of information needed to recognize a 3D object, since additional virtual views can be generated from given model views by the appropriate symmetry transformations. Under special conditions, a single non-accidental 'model' view is theoretically sufficient for recognition of novel views, if the object is bilaterally symmetric, whereas the theoretical minimum (under the same conditions) for a non-symmetric object is two views. In practice, it is expected that the 'virtual' views provided by the symmetry property will facilitate human recognition of novel views. Psychophysical experiments confirm that humans are better in the recognition of symmetric objects. The hypothesis of symmetry-induced virtual views together with a network model that successfully accounts for human recognition of generic 3D objects leads to predictions that we have verified with psychophysical experiments. WHEN NETWORKS DISAGREE: ENSEMBLE METHODS FOR HYBRID NEURAL NETWORKS

Michael P. Perrone and Leon N. Cooper 20 Jan. 1993 17 p LIMITED REPRODUCIBILITY: Availability: Document partially illegible
(Contract DAAL03-91-G-0325)
(AD-A260121; ARO-29170.1-LS) Avail: CASI HC A03/MF A01

This paper presents a general theoretical framework for ensemble methods of constructing significantly improved regression estimates. Given a population of regression estimates, we construct a hybrid estimator which is as good or better in the MSE sense than any estimator in the population. We argue that the ensemble method presented has several properties: it efficiently uses all the networks of a population - none of the networks need be discarded; it efficiently uses all the available data for training without over-fitting; it inherently performs regularization by smoothing in functional space which helps to avoid over-fitting; it utilizes local minima to construct improved estimates whereas other neural network algorithms are hindered by local minima; it is ideally suited for parallel computation; and it leads to a very useful and natural measure of the number of distinct estimators in a population. The optimal parameters of the ensemble estimator are given in closed form. Experimental results are provided which show that the ensemble method dramatically improves neural network performance on difficult real-world optical character recognition tasks. GRA

THREE DIMENSIONAL OBJECT RECOGNITION USING AN UNSUPERVISED NEURAL NETWORK: UNDERSTANDING THE DISTINGUISHING FEATURES

Nathan Intrator, Heinrich H. Bulthoff, Josh I. Gold, and Shimon Edelman 23 Dec. 1992 9 p

(Contract N00014-91-J-1316)

(AD-A260048; TR-63) Avail: CASI HC A02/MF A01

A novel method for feature extraction has been applied to a problem of three-dimensional object recognition (Intrator and Gold, 1991). The method is related to recent statistical theory (Huber, 1985; Friedman, 1987) and is derived from a biologically motivated computational theory (Bienenstock et al., 1982). Results of an initial study replicating recent psychophysical experiments (Bulthoff and Edelman, 1991) demonstrated the utility of the proposed method for feature extraction. We describe further experiments designed to analyze the nature of the extracted features, and their relevance to the theory and psychophysics of object recognition. GRA

NONLINEAR ADAPTIVE CONTROL OF ELECTRO-MECHANICAL SYSTEMS Ph.D. Thesis

Degang Chen 1992 124 p

Avail: Univ. Microfilms Order No. DA9237791

This thesis sets out to investigate three fundamental problems which appear frequently in the control of electro-mechanical systems. The main part of the thesis concerns the adaptive linearization of actuator dynamics. In particular, we address the timely and important issue of torque-ripple cancellation in motor control in direct-drive robot applications. After modeling the motor dynamics, we present a new adaptive linearizing controller which uses half the number of parameters used in the standard approach and has a simple structure. This is a unique nonlinear adaptive control for which conditions on exogenous signals are found to guarantee persistency of excitation. Using a new coupled Lyapunov function dynamics technique, we establish robustness to model uncertainties nonlinear in both tracking error and parameters, even when the adaptation rate is reduced. Building on this, we investigate paramter convergence in the presence of high frequency residual torque-ripple using generalized harmonic analysis. The control has been successfully implemented and experimental results demonstrate a dramatic 30dB reduction of torque-ripple. In the second part of the thesis we study robust control of multi-body mechanical systems. A robust stability condition is presented together with a simple procedure for synthesizing such robust PID controllers. A new Kharitonov-like result is proven for multi-variable PID controllers which states roughly that a controller designed for an upper bounding inertia matrix results in stable set-point regulation for all other inertias. This is generalized to a special matrix Kharitonov theorem for n-th order polynomials with matrix coefficients lying between symmetric positive definite matrices of the same shape. A counterexample shows that the result cannot be extended to arbitrary bounding matrices. The design procedure is also applied to a two link robot manipulation and simulation results confirm the theory. The last part treats a new stable inversion problem which was motivated by our study of the inverse dynamics and control of articulated flexible structures. Taking a differential geometric approach, we set up a general framework for constructing the stable inversion of nonlinear nonminimum phase systems. Using the notion of stable and unstable invariant manifolds, the inversion problem is transferred into a two-point boundary value problem. This method is also applied to output tracking and it performs much better in simulation than the nonlinear regulator approach. Dissert. Abstr.

N93-23717 Virginia Univ., Charlottesville.

THE ROBUSTNESS OF FEED-FORWARD NEURAL NETWORKS: A PRELIMINARY INVESTIGATION Ph.D. Thesis

Ali Ahmad Minai 1992 252 p

Avail: Univ. Microfilms Order No. DA9237493

Connectionist networks are distributed systems, i.e. they consist of numerous interconnected but distinctly identifiable units. Their global behavior arises as a consequence of the behavior of these individual units. This gives connectionist systems two great advantages: (1) flexibility to adapt in response to changing requirements; and (2) robustness with respect to faults in individual units. It is obvious that the art of modelling with connectionist systems should take these strengths into account. In reality, however, there has been very little research on these specific issues, and virtually none on exploring their relationship. The research reported here is a preliminary attempt at such exploration. Feed-forward neural networks with real-valued inputs and outputs (approximation networks) are being used for modelling non-linear--especially chaotic--systems. In all cases, some iterative method is used to optimize (train) these networks on finite sets of data. This process usually converges to local minima, so that several equally accurate solutions are often obtained for any given problem. Some external criterion is needed to choose between these solutions. Usually, cross-validation with a testing set is the method of choice, but this often fails to provide adequate discrimination. In this research, an additional criterion--robustness--is proposed as a means of selection. It is the contention of this research that such a criterion is well-motivated from a connectionist perspective. Informally, robustness is the ability of a system to tolerate faults in its components. In this dissertation, a very specific simple class of faults is considered: random perturbations in the outputs of single internal neurons. The main assumption is that only one neuron is perturbed during the presentation of one particular input to the network. The primary work reported here is a tractable method of characterizing the robustness of specific networks. This enables the modeller to predict the mean and variance of the deviation caused at the network output by a random perturbation process of known distribution. The approach used is based on approximating the relationship between individual neurons and network output by truncated power series expansions. A method similar to back-propagation can be used to obtain the necessary derivatives. It is shown theoretically that typical approximation networks with sigmoidal neurons allow low-order power series expansions at neuron outputs without encountering convergence problems. The empirical results bear this out. They also demonstrate that the method developed in this research is very successful in predicting the effect of random single neuron perturbations. Another aspect of the research reported here is the attempt to develop a preliminary theoretical framework for relating the performance of networks of the performance of their components. It is argued that the components of robust networks are minimally and equally relevant. This assertion leads to a consistent characterization of distributedness in network representations. Dissert. Abstr.

FORCE DISTRIBUTION FORMULATION AND ANALYSIS FOR MULTIPLE-CONTACT POWER GRASP Ph.D. Thesis

Khalid Mirza 1992 309 p

Avail: Univ. Microfilms Order No. DA9238236

A fundamental problem concerning dexterous hands is to find an optimal grasp to securely hold an object without crushing or slipping. Furthermore, some task domains require dexterous hands to handle objects whose characteristics cannot be anticipated or are very complex to model. A type of grasp that is highly effective for these applications is the power or enveloping grasp, which is characterized by multiple points of contact between the grasped object and the surfaces of the fingers and palm. Limited research in this area is because of analytical difficulties resulting from the highly overconstrained, closed-kinematic structure due to multiple contacts. The major objectives of this research are to develop a general force distribution formulation and to perform static and dynamic stability analyses for multiple-contact power grasp. The force distribution formulation allows the object to make contact on any surface of the dexterous hand. Hand Jacobian and grasp matrices are defined for the power grasp, which relate the joint torques to the wrench on the object. A constrained optimization problem suitable for linear programming, is formulated by combining the general force distribution equations with the constraints due to friction and joint torque limits, and is represented in a concise matrix form. Using the force distribution equations, a method for static stability analysis of power grasp is developed. The quality measure of the grasp is defined in terms of the stability region which completely describes the external load resistance capability of the grasp. Various task-oriented stability criteria are also defined which optimize the stability region. A dynamic simulation algorithm is developed to study the dynamic stability properties of power grasp. It is based on a discrete-time, state variable model of a power grasp, and uses local geometric information to implement the compliant contact model with rolling, slipping and wedging effects, along with handling the changing topological structure of power grasp dynamics. A number of experiments are performed using the DIGITS Grasping System

model, which show the stability and robustness of power grasp and its effectiveness in unstructured environments with only a simple open-loop torque control. Dissert. Abstr.

ON POSITIVE INVARIANCE AND CONSTRAINED CONTROL OF LINEAR MULTIVARIABLE SYSTEMS Ph.D. Thesis - Toulouse Univ.

Eugenio deBonaCastelanNeto 1992 145 p In FRENCH; ENGLISH summary Sponsored by Coordenacao de Aperfeicoamento de Pessoal de Nivel Superior, Brazil

(LAAS-92223; ETN-93-93685) Avail: CASI HC A07/MF A02

Some contributions in the field of constrained linear multivariable systems are presented. The basic theoretical tool used is the positive invariance property of polyhedral domains for continuous time and discrete time linear systems. For such systems, the positive invariance property of a convex polyhedron can be obtained by solving two matrix equations known as positive invariance relations. To treat the problem of constraints satisfaction for controlled systems through the use of the positive invariance property, some techniques for solving the positive invariance relations are developed. These techniques are based on closed loop eigenstructure assignment. They can be applied to both cases of constraints in state and in control vectors. The robustness of the positive invariance property is characterized with respect to parametric variations and the performance robustness for the proposed control laws is described. In the case of systems with constrained control variables, the robustness study allows the positive invariance domain to be extended when using a saturated control law. ESA

FACE RECOGNITION WITH NEURAL NETWORKS M.S. Thesis

Dennis L. Krepp Dec. 1992 123 p

(AD-A259587; AFIT/GE/Eng/92D-23) Avail: CASI HC A06/MF A02

This study investigated neural networks for face verification and classification. The research concentrated on developing a neural network based feature extractor and/or classifier to perform authorized user verification in a realistic work environment. Recognition accuracy, system assumptions, training time, and execution time were analyzed to determine the feasibility of a neural network approach. Data was collected using a camcorder and two segmentation schemes: manual segmentation and motion-based, automatic segmentation. Data consisted of over 2000, 32x32 pixel, 8 bit gray scale images of 52 subjects; each subject had two to ten days worth of images collected. Several training and test sets were created and then used to train and test the following networks: a back propagation network using the raw data as inputs, a back propagation network using Karhunen-Loeve Transform coefficients, computed from the raw, data, as inputs; and a back propagation network using features extracted by an identity network as inputs. The classification networks performed well on constrained, single day captured, data bases but performed poorly on data gathered over multiple days. For multiple days, a verification network using a single hidden layer with back propagation obtained 95 percent verification accuracy and is suitable for use in a face verification system. GRA

THE MULTI-SCALE VETO MODEL: A TWO-STAGE ANALOG NETWORK FOR EDGE DETECTION AND IMAGE RECONSTRUCTION

Lisa Dron Mar. 1992 31 p

(Contract N00014-85-K-0124; NSF MIP-91-17724)

(AD-A259600; AI-M-1320) Avail: CASI HC A03/MF A01

This paper presents the theory behind a model for a two-stage analog network for edge detection and image reconstruction to be implemented in VLSI. Edges are detected in the first stage using the multi-scale veto rule, which states that an edge is significant if and only if it passes a threshold test at each of a set of different spatial scales. The image is reconstructed in the second stage from the brightness values adjacent to the edge locations. Among the key features of this model are that edges are localized at the resolution of the smallest spatial scale without having to identify maxima in brightness gradients, while noise is removed with the efficiency of the largest scale. There are no problems of local minima, and for any given set of parameters there is a unique solution. Images reconstructed from the brightnesses adjacent to the marked edges are very similar visually to the originals. Significant bandwidth compression can thus be achieved without noticeably compromising image quality. GRA

A NEW CONJUGATE GRADIENT METHOD FOR OPTIMAL CONTROL

K. M. Khoda and C. Storey Aug. 1992 14 p Presented at SIAM Conference on Control and Its Applications, Minneapolis, MN, 17-19 Sep. 1992

(MATHS-Rept-A-174; ETN-93-93558) Avail: CASI HC A03/MF A01

The Generalized Polak-Ribiere (GPR) algorithm for unconstrained static optimization, which takes the effect of inexact line searches into account, was developed and shown to be more efficient than some compatible algorithms. The algorithm is used in function space form to solve a number of optimal control problems of both singular and nonsingular nature. It is shown to be very efficient especially in terms of the number of iterations required for convergence, compared with existing conjugate gradient techniques. ESA

LEARNING OPTIMAL CONTROL USING LEARNING AUTOMATA

Q. H. Wu Sep. 1992 26 p

(MATHS-Rept-A-176; ETN-93-93560) Avail: CASI HC A03/MF A01

The application of reinforcement learning techniques to the stochastic optimal control problem is addressed. A method based on learning automata for designing controllers for the control of complex dynamic systems is presented. Focus is on the design of a learning automaton using subsets of control actions to reduce the number of actions during a learning procedure. The subsets of actions can be expanded or contracted according to action probabilities which are reset from time to time so as to achieve a global selection over the action set. Two reinforcement schemes were investigated alongside the variable subsets of control actions. A reference performance index and an approach to quantification and normalization of the performance index are proposed in association with the two schemes in order to evaluate environment responses during the learning procedure. The method was used to achieve learning control for an unknown nonlinear turbogenerator system. ESA

SPACE EFFICIENT 3D MODEL INDEXING

David W. Jacobs Feb. 1992 26 p

(Contracts DACA76-85-C-0010; N00014-85-K-0124)

(AD-A259571; AI-M-1353) Avail: CASI HC A03/MF A01

We show that the set of 2D images produced by the point features of a rigid 3D model can be represented with two lines in two high-dimensional spaces. These lines are the lowest-dimensional representation possible. We use this result to build a system for representing in a hash table at compile time, all the images that groups of model features can produce. Then at run time a group of image features can access the table and find all model groups that could match it. This table is efficient in terms of space, and is built and accessed through analytic methods that account for the effect of sensing error. In real images, it reduces the set of potential matches by a factor of several thousand. We also use this representation of a model's images to analyze two other approaches to recognition: invariants, and non-accidental properties. These are properties of images that some models always produce, and all other models either never produce (invariants) or almost never produce (non-accidental properties). In several domains we determine when invariants exist. In general we show that there is an infinite set of non-accidental properties that are qualitatively similar. GRA

DETERMINISTIC METHODS IN STOCHASTIC OPTIMAL CONTROL Final Report

Mark H. Davis and Gabriel Burstein Oct. 1992 89 p

(Contract DAJA45-90-C-0024)

(AD-A260478) Avail: CASI HC A05/MF A01

A new approach to the control of systems represented by stochastic

differential equations (SDE's) is developed in which stochastic control is viewed as deterministic control with a particular form of constraint structure. Specifically, the characteristic nonanticipativity property of the control processes is formulated as an equality constraint on the set of possibly anticipative processes. The optimal nonanticipative control is then recovered by minimizing, over the class of possibly anticipating processes, a cost function modified by the inclusion of a Lagrange multiplier term to enforce the nonanticipativity constraint. This unconstrained minimization is carried out pathwise-i.e., separately for each value of a certain random parameter and hence reduces to a parameterized family of deterministic optimal control problems. Solution of the controlled SDE's with anticipative controls are defined by a decomposition method. It is shown that the value function of the control problem is the unique global solution of a robust equation (random partial differential equation) associated to a linear backward Hamilton-Jacobi-Bellman stochastic partial differential equation (HJB SPDE). WHAT MAKES A GOOD FEATURE? Memorandum Report

W. Richards and A. Jepson Apr. 1992 43 p

(Contracts DACA76-85-C-0010; N00014-85-K-0124)

(AD-A259962; AI-M-1356; CBIP-72) Avail: CASI HC A03/MF A01

Perceptual information processing systems, both biological and non-biological, often consist of very elaborate algorithms designed to extract certain features or events from the input sensory array. Such features in vision range from simple 'on-off' units to 'hand' or 'face' detectors, and are now almost countless, so many having already been discovered or in use with no obvious limit in sight. Here we attempt to place some bounds upon just what features are worth computing. Previously, others have proposed that useful features reflect 'non-accidental' or 'suspicious' configurations that are especially informative yet typical of the world (such as two parallel lines). Using a Bayesian framework, we show how these intuitions can be made more precise, and in the process show that useful feature based inferences are highly dependent upon the context in which a feature is observed. For example, an inference supported by a feature at an early stage of processing when the context is relatively open may be nonsense in a more specific context provided by subsequent 'higher-level' processing. Therefore, specification for a 'good feature' requires a specification of the model class that sets the current context. We propose a general form for the structure of a model class, and use this structure as a basis for enumerating and evaluating appropriate 'good features'. Our conclusion is that one's cognitive capacities and goals are as important a part of 'good features' as are the regularities of the world. GRA

TRANSFORMATIONAL PLANNING OF REACTIVE BEHAVIOR

Drew McDermott Dec. 1992 71 p

(Contract N00014-91-J-1577)

(AD-A260350; YaleU/CSD/RR-941) Avail: CASI HC A04/MF A01

Reactive plans are plans that include steps for sensing the world and coping with the data so obtained. The application of AI planning techniques to plans of this sort in a simple simulated world is investigated. To achieve fast reaction times, it is assumed that the agent starts with a default reactive plan, while the planner attempts to improve it by applying plan transformations, thus searching through the space of transformed plans. When the planner has what it believes to be a better plan, it swaps the new plan into the agent's controller. The plans are written in a reactive language that allows for this kind of swapping. The language allows for concurrency, and hence, truly 'nonlinear' plans. The planner evaluates plans by projecting them, that is, generating scenarios for how execution might go. The resulting projections give estimates of plan values, but also provide clues to how the plan might be improved. These clues are unearthed by critics that go through the scenario sets, checking how the world state and the agent state evolved. The critics suggest plan transformations with associated estimates of how much they will improve the plan. Plan transformations must be able to edit code trees in such a way that the changes are orthogonal and reversible whenever possible. The system was tested by comparing the performance of the agent with and without planning. Preliminary results allow us to conclude that the planner can be fast and directed enough to generate improved plans in a timely fashion, and that the controller can often cope with a sudden shift of plan. GRA

DISTANCE METRIC BETWEEN 3D MODELS AND 2D IMAGES FOR RECOGNITION AND CLASSIFICATION

Ronen Basri and Daphna Weinshall Jul. 1992 35 p

(Contracts N00014-85-K-0124; N00014-91-J-4038)

(AD-A260069; MIT-AIM-1373) Avail: CASI HC A03/MF A01

Similarity measurements between 3D objects and 2D images are useful for the tasks of object recognition and classification. We distinguish between two types of similarity metrics: metrics computed in image-space (image metrics) and metrics computed in transformation-space (transformation metrics). Existing methods typically use image metrics; namely, metrics that measure the difference in the image between the observed image and the nearest view of the object. Example for such a measure is the Euclidean distance between feature points in the image and their corresponding points in the nearest view. (Computing this measure is equivalent to solving the exterior orientation calibration problem.) In this paper we introduce a different type of metrics: transformation metrics. These metrics penalize for the deformations applied to the object to produce the observed image. We present a transformation metric that optimally penalizes for affine deformations under weak-perspective. A closed-form solution, together with the nearest view according to this metric, are derived. The metric is shown to be equivalent to the Euclidean image metric, in the sense that they bound each other from both above and below. For the Euclidean image metric we offer a sub-optimal closed-form solution and an iterative scheme to compute the exact solution. GRA

A CAPACITANCE-BASED PROXIMITY SENSOR FOR WHOLE ARM OBSTACLE AVOIDANCE

J. L. Novak and J. T. Feddema 2 Nov. 1992 8 p Presented at the 5th Topical Meeting on Robotics and Remote Systems, Knoxville, TN, 26-29 Apr. 1993

(Contract DE-AC04-76DP-00789)

(DE93-006773; SAND-92-1604C; CONF-930403-14) Avail: CASI HC A02/MF A01

This paper discusses an application of capacitive sensors for detecting incipient collisions during robot motion in unknown or partially modeled environments. Forty-five sensors capable of detecting obstacles up to 330 mm (13 in.) away were distributed over the surface of a PUMA 560 robot arm. Each sensor consisted of a 4 mm thick, 37 mm diameter rings around 21 mm diameter disks. These sensors can detect both conductive and non-conductive obstacles of arbitrary color and shape. The sensor hardware is reliable and inexpensive, and it may be fabricated using flexible printed circuit boards to provide whole-arm and joint protection for any robot or manipulator. Simple collision avoidance control algorithms that perturb the joint commands from a spaceball to avoid collisions have been implemented on the PUMA 560 robot. DOE

(DE93-003549; CONF-920538-28) Avail: CASI HC A03/MF A01

Vibration monitoring of components in engineering systems and plants involves the collection of vibration data and detailed analysis to detect features which reflect the operational state of the machinery. The analysis leads to the identification of potential failures and their causes, and makes it possible to perform efficient preventive maintenance. This paper describes a methodology for the automation of some of the activities related to motion and vibration monitoring in these systems. The technique involves training a neural network to model the inter-relationship between signals from two related sensors mounted on an engineering system or component at a time when it is known to be operating properly. Then one signal (or its characteristics) is put into the neural network model to predict the second signal (or its characteristics). This predicted signal is continuously compared with the actual signal. A deviation between the predicted and actual signal indicates a changing relationship, usually failure of the component or system. This deviation may be quantified and provides meaningful information about the degree of degradation and deterioration of the component. DOE

(Contract DE-FG07-88ER-12824)
(DE93-003541; CONF-920368-1) Avail: CASI HC A02/MF A01

The application of neural networks, alone or in conjunction with other advanced technologies (expert systems, fuzzy logic, and/or genetic algorithms), to some of the problems of complex engineering systems has the potential to enhance the safety, reliability, and operability of these systems. Typically, the measured variables from the systems are analog variables that must be sampled and normalized to expected peak values before they are introduced into neural networks. Often data must be processed to put it into a form more acceptable to the neural network (e.g., a fast Fourier transformation of the time-series data to produce a spectral plot of the data). Specific applications described include: (1) Diagnostics--State of the Plant, (2) Hybrid System for Transient Identification, (3) Sensor Validation, (4) Plant-Wide Monitoring, (5) Monitoring of Performance and Efficiency, and (6) Analysis of Vibrations. Although specific examples described deal with nuclear power plants or their subsystems, the techniques described can be applied to a wide variety of complex engineering systems. DOE

A NOVEL RECURSIVE PARTITIONING CRITERION Technical Report
Michael P. Perrone 23 Dec. 1992 7 p
(Contract N00014-91-J-1316)
(AD-A259921) Avail: CASI HC A02/MF A01

A data-driven algorithm for partitioning many-class classification problems is presented. The algorithm generates tree-structured hybrid networks with controller nets at tree branches and local expert nets at the leaves. The controller nets recursively partition the feature space according to a novel misclassification minimization rule designed to create groupings of the classes which simplify the classification task. Each local expert is trained only on a subset of the training data corresponding to one of the partitions. The advantage to this approach is that the classification task that each local expert performs is greatly simplified. This simplification helps to avoid the curse of dimensionality and scaling problems by allowing the local expert nets to focus their search for structure in a small portion of the input space. GRA

An integrated, optoelectronic, variable thresholding neuron implemented monolithically in GaAs integrated circuit and exhibiting high differential optical gain and low power consumption is presented. Two alternative embodiments each comprise an LED monolithically integrated with a detector and two transistors. One of the transistors is responsive to a bias voltage applied to its gate for varying the threshold of the neuron. One embodiment is implemented as an LED monolithically integrated with a double heterojunction bipolar phototransistor (detector) and two metal semiconductor field effect transistors (MESFET's) on a single GaAs substrate and another embodiment is implemented as an LED monolithically integrated with three MESFET's (one of which is an optical FET detector) on a single GaAs substrate. The first noted embodiment exhibits a differential optical gain of 6 and an optical switching energy of 10 pJ. The second embodiment has a differential optical gain of 80 and an optical switching energy of 38 pJ. Power consumption is 2.4 and 1.8 mW, respectively. Input 'light' power needed to turn on the LED is 2 micro-W and 54 nW, respectively. In both embodiments the detector is in series with a biasing MESFET and saturates the other MESFET upon detecting light above a threshold level. The saturated MESFET turns on the LED. Voltage applied to the biasing MESFET gate controls the threshold.

RELIABLE VISION-GUIDED GRASPING
Keith E. Nicewarner and Robert B. Kelley Aug. 1992 12 p Previously announced in IAA as A93-29124
(Grant NAGw-1333)
(NASA-CR-193197; NAS 1.26:193197; RPI-CIRSSE-125) Avail: CASI HC A03/MF A01

Automated assembly of truss structures in space requires vision-guided servoing for grasping a strut when its position and orientation are uncertain. This paper presents a methodology for efficient and robust vision-guided robot grasping alignment. The vision-guided grasping problem is related to vision-guided 'docking' problems. It differs from other hand-in-eye visual servoing problems, such as tracking, in that the distance from the target is a relevant servo parameter. The methodology described in this paper is hierarchy of levels in which the vision/robot interface is decreasingly 'intelligent,' and increasingly fast. Speed is achieved primarily by information reduction. This reduction exploits the use of region-of-interest windows in the image plane and feature motion prediction. These reductions invariably require stringent assumptions about the image. Therefore, at a higher level, these assumptions are verified using slower, more reliable methods. This hierarchy provides for robust error recovery in that when a lower-level routine fails, the next-higher routine will be called and so on. A working system is described which visually aligns a robot to grasp a cylindrical strut. The system uses a single camera mounted on the end effector of a robot and requires only crude calibration parameters. The grasping procedure is fast and reliable, with a multi-level error recovery system. Author

ADAPTIVE CONTROL OF UNCERTAIN SYSTEMS Ph.D. Thesis
Daniel E. Miller Toronto, Ontario Univ. of Toronto 1989 199 p
(ISBN-0-315-54485-6; CTN-93-60658) Copyright Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada, HC

The boundaries of what is theoretically achievable using adaptive control are explored in an approach that yields a controller whose parameters are adjusted as time evolves. The plants considered in the study are linear

time-varying, of finite dimension. An operator framework is used to present the results, facilitating a precise definition of the control problems under consideration. Each controller presented consists of a linear time-invariant compensator whose gains switch in accordance with an auxiliary switching signal. In considering the stabilization problem, an adaptive controller is developed which provides a weak asymptotic type of stability for a large class of time-varying plants; from this is developed another controller which provides a stronger exponential type of stability for a slightly smaller class of plants. These results are extended to that of tracking and disturbance regulation in the case where both the reference and the disturbance satisfy known linear time-invariant differential equations. For the model reference adaptive control problem, where the goal is to track a much larger class of signals, it is shown that certain prior plant information is necessary. An adaptive controller is then constructed which solves a modified version of this problem. Author (CISTI)

SUMMARY FROM A STUDY GROUP ON NEURAL NETWORKS AT NDRE [OPPSUMMERING FRA STUDIEGRUPPEN FOR NEVRALE NETT VED FFI]
Grem S. Gjoennes, Georg Anuglen, Oddbjoern Bergem, Eivind Engebretsen, Hans C. Palm, Ingrid Storruste, and Terje Wahl 3 Jun. 1992 56 p In NORWEGIAN
(FFI-92/7015; ETN-93-93567) Avail: CASI HC A04/MF A01

The findings of an ad hoc study group which were established by NDRE to locate future, promising application areas for the use of neural network technology, are summarized. The arguments are based on either of the following types of information: general insights obtained through ten colloquys on selected topics; a literature survey of existing applications; an overview of existing and future implementation technologies and algorithms; and analyses of NDRE's strategy document and NDRE's program proposal. The conclusions give the following: a broad outline of both the technical and the theoretical status of current neural network technology; a list of a number of applications of particular relevance to NDRE; and recommendations to a course of action for NDRE to possess the necessary knownhow to be an efficient user of neural network technology. VISION-GUIDED GRIPPING OF A CYLINDER
Keith E. Nicewarner and Robert B. Kelley 1991 12 p Presented at the First IARP Workshop on Robotics in Space, Pisa, Italy, 17-18 Jun. 1991
(Grant NAGw-1333)
(NASA-CR-193199; NAS 1.26:193199; RPI-CIRSSE-93) Avail: CASI HC A03/MF A01

The motivation for vision-guided servoing is taken from tasks in automated or telerobotic space assembly and construction. Vision-guided servoing requires the ability to perform rapid pose estimates and provide predictive feature tracking. Monocular information from a gripper-mounted camera is used to servo the gripper to grasp a cylinder. The procedure is divided into recognition and servo phases. The recognition stage verifies the presence of a cylinder in the camera field of view. Then an initial pose estimate is computed and uncluttered scan regions are selected. The servo phase processes only the selected scan regions of the image. Given the knowledge, from the recognition phase, that there is a cylinder in the image and knowing the radius of the cylinder, 4 of the 6 pose parameters can be estimated with minimal computation. The relative motion of the cylinder is obtained by using the current pose and prior pose estimates. The motion information is then used to generate a predictive feature-based trajectory for the path of the gripper. Author

INVERTING SETS AND THE PACKING PROBLEM
Vance Faber, Mark K. Goldberg, Emanuel Knill (Nova Scotia Technical Coll., Halifax.), and Thomas H. Spencer (Nebraska Univ., Omaha.) 1992 16 p Presented at the 7th International Conference on Graph Theory, Combinatorics, Algorithms, and Applications, Kalamazoo, MI, 1-5 Jun. 1992
(Contract W-7405-eng-36)
(DE93-003822; LA-UR-92-3725; CONF-9206317-1) Avail: CASI HC A03/MF A01

Given a set V, a subset S, and a permutation pi of V, we say that pi permutes S if pi(S) intersection S = theta. Given a collection S = (V; S(sub 1)..., S(sub m)), where S(sub i) improper subset V (i = 1,..., m), we say that S is invertible if there is a permutation pi of V such that pi(S(sub i)) improper subset V - S(sub i). We present necessary and sufficient conditions for the invertibility of a collection and construct a polynomial algorithm which determines whether a given collection is invertible. For an arbitrary collection, we give a lower bound for the maximum number of sets that can be inverted. Finally, we consider the problem of constructing a collection of sets such that no sub-collection of size three is invertible. Our constructions of such collections come from solutions to the packing problem with unbounded block sizes. We prove several new lower and upper bounds for the packing problem and present a new explicit construction of packing. DOE

APREPRO: AN ALGEBRAIC PREPROCESSOR FOR PARAMETERIZING FINITE ELEMENT ANALYSES
G. D. Sjaardema Dec. 1992 57 p
(Contract DE-AC04-76DP-00789)
(DE93-006989; SAND-92-2291) Avail: CASI HC A04/MF A01

Aprepro is an algebraic preprocessor that reads a file containing both general text and algebraic, string, or conditional expressions. It interprets the expressions and outputs them to the output file along with the general text. The syntax used in Aprepro is such that all expressions between the delimiters and are evaluated and all other text is simply echoed to the output file. Aprepro contains several mathematical functions, string functions, and flow control constructs. In addition, functions are included that, with some additional files, implement a units conversion system and a material database lookup system. Aprepro was written primarily to simplify the preparation of parameterized input files for finite element analyses at Sandia National Laboratories; however, it can process any text file that does not use the characters. A TIME-ACCURATE HIGH-RESOLUTION TVD SCHEME FOR SOLVING THE NAVIER-STOKES EQUATIONS
Hyun Dae Kim and Nan-Suey Liu Dec. 1992 26 p Original contains color illustrations
(RTOP 505-62-52)
(NASA-TM-106056; E-7466; NAS 1.15:106056) Avail: CASI HC A03/MF A01; 4 functional color pages

A total variation diminishing (TVD) scheme has been developed and incorporated into an existing time-accurate high-resolution Navier-Stokes code. The accuracy and the robustness of the resulting solution procedure have been assessed by performing many calculations in four different areas: shock tube flows, regular shock reflection, supersonic boundary layer, and shock boundary layer interactions. These numerical results compare well with corresponding exact solutions or experimental data.

ACCURATE COMPUTATION AND CONTINUATION OF HOMOCLINIC AND HETEROCLINIC ORBITS FOR SINGULAR PERTURBATION PROBLEMS Final Report
William W. Vaughan, Mark J. Friedman, and Anand C. Monteiro Washington Mar. 1993 73 p
(Contract NAS8-36955)
(NASA-CR-4503; M-717; NAS 1.26:4503; UAH-5-32341) Avail: CAS! HC A04/MF A01

In earlier papers, Doedel and the authors have developed a numerical method and derived error estimates for the computation of branches of heteroclinic orbits for a system of autonomous ordinary differential equations in R(exp n). The idea of the method is to reduce a boundary value problem on the real line to a boundary value problem on a finite interval by using a local (linear or higher order) approximation of the stable and unstable manifolds. A practical limitation for the computation of homoclinic and heteroclinic orbits has been the difficulty in obtaining starting orbits. Typically these were obtained from a closed form solution or via a homotopy from a known solution. Here we consider extensions of our algorithm which allow us to obtain starting orbits on the continuation branch in a more systematic way as well as make the continuation algorithm more flexible. In applications, we use the continuation software package AUTO in combination with some initial value software. The examples considered include computation of homoclinic orbits in a singular perturbation problem and in a turbulent fluid boundary layer in the wall region problem.

THE CANONICAL FORMS OF A LATTICE RULE
J. N. Lyness 1992 15 p Presented at the 4th Numerical Integration Conference, Oberwolfach, Germany, 8-14 Nov. 1992
(Contract W-31-109-eng-38)
(DE93-005686; ANL/MCS/CP-78196; CONF-9211161-1) Avail: CASI HC A03/MF A01

Much of the elementary theory of lattice rules may be presented as an elegant application of classical results. These include Kronecker group representation theorem and the Hermite and Smith normal forms of integer matrices. The theory of the canonical form is a case in point. In this paper, some of this theory is treated in a constructive rather than abstract manner. A step-by-step approach that parallels the group theory is described, leading to an algorithm to obtain a canonical form of a rule of prime power order. The number of possible distinct canonical forms is derived, and this is used to determine the number of integration lattices having specified invariants. DOE

EXTENDING COMPILE-TIME REVERSE MODE AND EXPLOITING PARTIAL SEPARABILITY IN ADIFOR

C. H. Bischof and M. El-Khadiri Oct. 1992 43 p

(Contract W-31-109-eng-38)

(DE93-004668; ANL/MCS-TM-163) Avail: CASI HC A03/MF A01

The numerical methods employed in the solution of many scientific computing problems require the computation of the gradient of a function f:R(sup n) yields R. ADIFOR is a source translator that, given a collection of subroutines to compute f, generates FORTRAN 77 code for computing the derivative of this function. Using the so-called torsion problem from the MINPACK-2 test collection as an example, two issues in automatic differentiation are explored: the efficient computation of derivatives for partial separable functions and the use of the compile-time reverse mode for the generation of derivatives. It is shown that orders of magnitudes of improvement are possible when exploiting partial separability and maximizing use of the reverse mode. DOE

IMPROVED DETERMINISTIC CALCULATIONAL METHODS FOR IRREGULARLY SHAPED SHIELDS

J. J. Dorning Dec. 1992 41 p

(Contract DE-FG07-88ER-12818)

(DE93-004955; DOE/ER-12818/2; UVA-527390/MANE93/102) Avail: CASI HC A03/MF A01

A new discrete nodal transport method has been developed for general two-dimensional curvilinear geometry by using a boundary-fitted coordinate transformation from the general 'physical' coordinates to square 'computational' coordinates. The metrics which appear in the transformed transport equation are expanded using a simple polynomial function, and the angular divergence term is treated in the same way it is treated in S(sub N) methods for curved geometries. Because the metrics of the transformation depend upon the computational coordinates, the technical details of the formal development of the nodal method differ from those of ordinary nodal methods for rectangular geometry. However, the computational process in the transformed rectangular coordinate system is very similar to that used in conventional discrete nodal transport methods. A discrete S(sub N) method has also been developed to solve the boundary-fitted coordinate transformed transport equation. Simple test problems for non-simple geometries were solved using the zeroth-order nodal method, the first-order nodal method, and the S(sub N) method for the same physical and computational grids. The results for the test problems studied showed that, for most performance criteria, the computational efficiency of the zeroth-order nodal method was the highest of the three methods. DOE

LARGE-SCALE COMPUTATION OF INCOMPRESSIBLE VISCOUS FLOW BY LEAST-SQUARES FINITE ELEMENT METHOD

Bo-nan Jiang, T. L. Lin (Livermore Software Technology Corp., CA.), and Louis A. Povinelli Mar. 1993 22 p

(Contract NCC3-233; RTOP 505-62-21)

(NASA-TM-105904; E-7667; NAS 1.15:105904; ICOMP-93-06) Avail: CASI HC A03/MF A01

The least-squares finite element method (LSFEM) based on the velocity-pressure-vorticity formulation is applied to large-scale/three-dimensional steady incompressible Navier-Stokes problems. This method can accommodate equal-order interpolations and results in symmetric, positive definite algebraic system which can be solved effectively by simple iterative methods. The first-order velocity-Bernoulli function-vorticity formulation for incompressible viscous flows is also tested. For three-dimensional cases, an additional compatibility equation, i.e., the divergence of the vorticity vector should be zero, is included to make the first-order system elliptic. The simple substitution of the Newton's method is employed to linearize the partial differential equations, the LSFEM is used to obtain discretized equations, and the system of algebraic equations is solved using the Jacobi preconditioned conjugate gradient method which avoids formation of either element or global matrices (matrix-free) to achieve high efficiency. To show the validity of this scheme for large-scale computation, we give numerical results for 2D driven cavity problem at Re = 10000 with 408 x 400 bilinear elements. The flow in a 3D cavity is calculated at Re = 100, 400, and 1,000 with 50 x 50 x 50 trilinear elements. The Taylor-Goertler-like vortices are observed for Re = 1,000. Author

THE ASYMPTOTIC SPECTRA OF BANDED TOEPLITZ AND QUASI-TOEPLITZ MATRICES

Richard M. Beam and Robert F. Warming Nov. 1991 38 p

(RTOP 505-59-53)

(NASA-TM-103900; A-92006; NAS 1.15:103900) Avail: CASI HC A03/MF A01

Toeplitz matrices occur in many mathematical, as well as, scientific and engineering investigations. This paper considers the spectra of banded Toeplitz and quasi-Toeplitz matrices with emphasis on non-normal matrices of arbitrarily large order and relatively small bandwidth. These are the type of matrices that appear in the investigation of stability and convergence of difference approximations to partial differential equations. Quasi-Toeplitz matrices are the result of non-Dirichlet boundary conditions for the difference approximations. The eigenvalue problem for a banded Toeplitz or quasi-Toeplitz matrix of large order is, in general, analytically intractable and (for non-normal matrices) numerically unreliable. An asymptotic (matrix order approaches infinity) approach partitions the eigenvalue analysis of a quasi-Toeplitz matrix into two parts, namely the analysis for the boundary condition independent spectrum and the analysis for the boundary condition dependent spectrum. The boundary condition independent spectrum is the same as the pure Toeplitz matrix spectrum. Algorithms for computing both parts of the spectrum are presented. Examples are used to demonstrate the utility of the algorithms, to present some interesting spectra, and to point out some of the numerical difficulties encountered when conventional matrix eigenvalue routines are employed for non-normal matrices of large order. The analysis for the Toeplitz spectrum also leads to a diagonal similarity transformation that improves conventional numerical eigenvalue computations. Finally, the algorithm for the asymptotic spectrum is extended to the Toeplitz generalized eigenvalue problem which occurs, for example, in the stability of Pade type difference approximations to differential equations. MONTE CARLO VARIANCE REDUCTION APPROACHES FOR NON-BOLTZMANN TALLIES

T. E. Booth Dec. 1992 70 p

(Contract W-7405-eng-36)

(DE93-005665; LA-12433) Avail: CASI HC A04/MF A01

Quantities that depend on the collective effects of groups of particles cannot be obtained from the standard Boltzmann transport equation. Monte Carlo estimates of these quantities are called non-Boltzmann tallies and have become increasingly important recently. Standard Monte Carlo variance reduction techniques were designed for tallies based on individual particles rather than groups of particles. Experience with non-Boltzmann tallies and analog Monte Carlo has demonstrated the severe limitations of analog Monte Carlo for many non-Boltzmann tallies. In fact, many calculations absolutely require variance reduction methods to achieve practical computation times. Three different approaches to variance reduction for non-Boltzmann tallies are described and shown to be unbiased. The advantages and disadvantages of each of the approaches are discussed. DOE

A LOCAL EXPONENTIAL TRANSFORM METHOD FOR GLOBAL VARIANCE REDUCTION IN MONTE CARLO TRANSPORT PROBLEMS
R. S. Baker and E. W. Larsen (Michigan Univ., Ann Arbor.) 1992 7 p Presented at the International Topical Meeting on Mathematical Methods and Supercomputing in Nuclear Application (M/C+SNA 1993), Karlsruhe, Germany, 19-23 Apr. 1993
(Contract W-7405-eng-36)
(DE92-018992; LA-UR-92-2349; CONF-930404-1) Avail: CASI HC A02/MF A01

Numerous variance reduction techniques, such as splitting/Russian roulette, weight windows, and the exponential transform exist for improving the efficiency of Monte Carlo transport calculations. Typically, however, these methods, while reducing the variance in the problem area of interest tend to increase the variance in other, presumably less important, regions. As such, these methods tend to be not as effective in Monte Carlo calculations which require the minimization of the variance everywhere. Recently, 'Local' Exponential Transform (LET) methods were developed as a means of approximating the zero-variance solution. A numerical solution to the adjoint diffusion equation is used, along with an exponential representation of the adjoint flux in each cell, to determine 'local' biasing parameters. These parameters are then used to bias the forward Monte Carlo transport calculation in a manner similar to the conventional exponential transform, but such that the transform parameters are now local in space and energy, not global. Results have shown that the Local Exponential Transform often offers a significant improvement over conventional geometry splitting/Russian roulette with weight windows. Since the biasing parameters for the Local Exponential Transform were determined from a low-order solution to the adjoint transport problem, the LET has been applied in problems where it was desirable to minimize the variance in a detector region. The purpose of this paper is to show that by basing the LET method upon a low-order solution to the forward transport problem, one can instead obtain biasing parameters which will minimize the maximum variance in a Monte Carlo transport calculation. THE p AND h-p VERSIONS OF THE FINITE ELEMENT METHOD: BASIC PRINCIPLES AND PROPERTIES Technical Note
Ivo Babuska and Manil Suri Sep. 1992 93 p
(Contracts N00014-89-J-1030; F49620-92-J-0100)
(AD-A260237; TN-BN-1139) Avail: CASI HC A05/MF A01

In the classical form of the finite element method, called the h version, piecewise polynomials of fixed degree p are used and the mesh size h is decreased for accuracy. In this paper, the fundamental theoretical ideas behind the relatively recent p-version and h-p version are discussed. In the p-version, a fixed mesh is used and p is allowed to increase. The h-p version combines both approaches. The basic properties and characteristics of these newer versions, especially in areas where their behavior is significantly different from that of the h-version, are described and explained. GRA

PREDICTING STRUCTURE IN NONSYMMETRIC SPARSE MATRIX FACTORIZATIONS
J. R. Gilbert (Xerox Palo Alto Research Center, CA.) and E. Ng 1991 36 p Presented at the IMA Workshop on Sparse Matrix Computations: Graph Theory Issues and Algorithms, Minneapolis, MN, 14-18 Oct. 1991
(Contract DE-AC05-84OR-21400)
(DE93-004119; CONF-9110404-2) Avail: CASI HC A03/MF A01

Many computations on sparse matrices have a phase that predicts the nonzero structure of the output, followed by a phase that actually performs the numerical computation. We study structure prediction for computations that involve nonsymmetric row and column permutations and nonsymmetric or non-square matrices. Our tools are bipartite graphs, matchings, and alternating paths. Our main new result concerns LU factorization with partial pivoting. We show that if a square matrix A has the strong Hall property (i.e., is fully indecomposable) then an upper bound due to George and Ng on the nonzero structure of L + U is as tight as possible. To show this, we prove a crucial result about alternating paths in strong Hall graphs. The alternating-paths theorem seems to be of independent interest: it can also be used to prove related results about structure prediction for QR factorization that are due to Coleman, Edenbrandt, Gilbert, Hare, Johnson, Olesky, Pothen, and van den Driessche. DOE

A DETAILED STUDY OF NONPERTURBATIVE SOLUTIONS OF TWO-BODY DIRAC EQUATIONS
H. W. Crater, R. L. Becker, C. Y. Wong, and P. VanAlstine Dec. 1992 159 p
(Contract DE-AC05-84OR-21400)
(DE93-004794; ORNL/TM-12122) Avail: CASI HC A08/MF . A02

In quark model calculations of the meson spectrum, fully covariant two-body Dirac equations dictated by Dirac's relativistic constraint mechanics gave a good fit to the entire meson mass spectrum for light quark mesons as well as heavy quark mesons with constituent world scalar and vector potentials depending on just one or two parameters. In this paper, we investigate the properties of these equations that made them work so well by solving them numerically for quantum electrodynamics (QED) and related field theories. The constraint formalism generates a relativistic quantum mechanics defined by two coupled Dirac equations on a sixteen component wave function which contain Lorentz covariant constituent potentials that are initially undetermined. An exact Pauli reduction leads to a second order relativistic Schroedinger-like equation for a reduced eight component wave function determined by an effective interaction--the quasipotential. We first determine perturbatively to lowest order the relativistic quasipotential for the Schroedinger-like equation by comparing that form with one derived from the Bethe-Salpeter equation. Insertion of this perturbative information into the minimal interaction structures of the two-body Dirac equations then completely determines their interaction structures. Then we give a procedure for constructing the full sixteen component solution to our coupled first-order Dirac equations from a solution of the second order equation for the reduced wave function. Next, we show that a perturbative treatment of these equations yields the standard spectral results for QED and related interactions. DOE

COMPLEX PRINCIPAL OSCILLATION PATTERN ANALYSIS
Gerd Buerger Jun. 1992 34 p
(MPIM-86; ETN-93-93447) Avail: CASI HC A03/MF A01

The Complex Principle Oscillation Pattern (CPOP) analysis is introduced as a new tool to resolve regularly evolving patterns from a process of usually high degree of freedom. A characteristic problem in climatological studies is that the involved processes are usually of very high complexity with a large number of degrees of freedom. CPOP is a modification of the conventional POP analysis. The modification results from a critical insight into the theory of linear systems of first order which uncovered problems that arise in the context of standing oscillations. The notion of the traveling rate of a mode is defined and it is demonstrated that the mode's frequency and traveling rate are directly coupled via the system matrix. One consequence is that clean standing oscillations cannot be modeled by linear systems of first order. Similarly to Hamiltonian mechanics the CPOP analysis introduces the conjugate counterpart of a state, which is a kind of momentum, and deals with the new complex state vector 'state + i.momentum'. The method is capable of resolving oscillatory patterns of any given traveling rate from a stationary process. First experiments show that the CPOPs evolve more regularly and with less noise than corresponding POP's. A prediction scheme which is appropriate for CPOP's is defined. With this scheme prediction skills are gained which are significantly stronger than those of the POP model. ESA

TIME-STABLE BOUNDARY CONDITIONS FOR FINITE-DIFFERENCE SCHEMES SOLVING HYPERBOLIC SYSTEMS: METHODOLOGY AND APPLICATION TO HIGH-ORDER COMPACT SCHEMES Final Report
Mark H. Carpenter, David Gottlieb (Brown Univ., Providence, RI.), and Saul Abarbanel (Tel-Aviv Univ., Israel.) Washington Mar. 1993 36 p Submitted for publication
(Contracts NAS1-19480; NAS1-18605; RTOP 505-90-52-01)
(NASA-CR-191436; NAS 1.26:191436; ICASE-93-9) Avail: CASI HC A03/MF A01

We present a systematic method for constructing boundary conditions

(numerical and physical) of the required accuracy, for compact (Pade-like) high-order finite-difference schemes for hyperbolic systems. First, a roper summation-by-parts formula is found for the approximate derivative. A 'simultaneous approximation term' (SAT) is then introduced to treat the boundary conditions. This procedure leads to time-stable schemes even in the system case. An explicit construction of the fourth-order compact case is given. Numerical studies are presented to verify the efficacy of the approach. Author

RELATIONSHIPS BETWEEN BANKRUPTCY GAMES AND MINIMUM COST SPANNING TREE GAMES

Theo S. H. Driessen May 1992 21 p

(MEMO-1058; ETN-93-93195) Avail: CASI HC A03/MF A01

The cost allocation problem of setting charges to the users in a given network is considered with the aid of minimum cost spanning trees in the network. In addition, the bankruptcy problem of dividing the estate of the bankrupt concern among the various creditors according to their claims is treated. The aim is to establish that, under certain circumstances, the bankruptcy problem can be seen as a minimum cost spanning tree allocation problem. In the game theoretic setting, the conditions of the estate and the claims which are sufficient and necessary for the repsentation of bankruptcy games as minimum cost spanning tree games are provided. A particular cost allocation rule for the minimum cost spanning tree allocation problem is shown to agree with a certain division rule for the bankruptcy problem. ESA

A COMPARISON OF POLYNOMIAL AND RATIONAL NARMAX MODELS FOR NONLINEAR SYSTEM IDENTIFICATION

Q. M. Zhu and S. A. Billings Jun. 1992 25 p

(Grant SERC-GR/F2417-7)

(RR-444; ETN-93-93490) Avail: CASI HC A03/MF A01

Polynomial and rational expansions of nonlinear stochastic dynamic models are compared. The structure, approximation properties, identifiability properties, and stability of the NARMAX models are discussed and a unified least squared identification algorithms is introduced. Mathematical models for functional approximation and data approximation are considered. Chaotic behavior, bifurcations, and fractals are addressed. The comparison showed that although the rational model often exhibits superior approximation properties, it is much more difficult to identify compared with the polynomial model. ESA

AN ALGEBRA OF DISCRETE EVENT PROCESSES

Michael Heymann and George Meyer Jun. 1991 75 p

(RTOP 505-66-01)

(NASA-TM-102848; A-90236; NAS 1.15:102848) Avail: CASI HC A04/MF A01

This report deals with an algebraic framework for modeling and control of discrete event processes. The report consists of two parts. The first part is introductory, and consists of a tutorial survey of the theory of concurrency in the spirit of Hoare's CSP, and an examination of the suitability of such an algebraic framework for dealing with various aspects of discrete event control. To this end a new concurrency operator is introduced and it is shown how the resulting framework can be applied. It is further shown that a suitable theory that deals with the new concurrency operator must be developed. In the second part of the report the formal algebra of discrete event control is developed. At the present time the second part of the report is still an incomplete and occasionally tentative working paper. Author

LEAST SQUARES SURFACE APPROXIMATION TO SCATTERED DATA USING MULTIQUADRIC FUNCTIONS Technical Report, Jan. - Dec. 1992

Richard Franke, Hans Hagen, and Gregory M. Nielson 15 Dec. 1992 31 p

(AD-A259804; NPS-MA-93-008) Avail: CASI HC A03/MF A01

This report documents an investigation into some methods for fitting surfaces to scattered data. The form of the fitting function is a multiquadric function with the criteria for the fit being the least mean squared residual for the data points. The principal problem is the selection of knot points (or base points for the multiquadric basis functions), although the selection of the multiquadric parameter also plays a nontrivial role in the process. We first describe a greedy algorithm for knot selection, and this procedure is used as an initial step in what follows. The minimization including knot locations and multiquadric parameter is explored, with some unexpected results in terms of 'near repeated' knots. This phenomenon is explored, and leads us to consider variable parameter values for the basis functions. Examples and results are given throughout. GRA

RECOGNIZING 3D OBJECTS FOR 2D IMAGES: AN ERROR ANALYSIS

W. E. Grimson, Daniel P. Huttenlocher, and T. D. Alter Jul. 1992 30 p

(Contracts DACA76-85-C-0010; N00014-86-K-0685)

(AD-A260150; AI-M-1362) Avail: CASI HC A03/MF A01

Many recent object recognition systems use a small number of pairings of data and model features to compute the 3D transformation from a model coordinate frame into the sensor coordinate system. In the case of perfect image data, these systems seem to work well. With uncertain image data, however, the performance of such methods is less well understood. In this paper, we examine the effects of two-dimensional sensor uncertainty on the computation of three-dimensional model transformations. We use this analysis to bound the uncertainty in the transformation parameters, as well as the uncertainty associated with applying the transformation to map other model features into the image. We also examine the effects of the transformation uncertainty on the effectiveness of recognition methods. GRA

The Helmholtz-Poincare Wave Equation (H-PWE) arises in many areas of classical wave scattering theory. In particular it can be found for the cases of acoustical scattering from submerged bounded objects and electromagnetic scattering from objects. The extended boundary integral equations (EBIE) method is derived from considering both the exterior and interior solutions of the H-PWEC's. This coupled set of expressions has the advantage of not only offering a prescription for obtaining a solution for the exterior scattering problem, but it also obviates the problem of irregular values corresponding to fictitious interior eigenvalues. Once the coupled equations are derived, they can be obtained in matrix form by expanding all relevant terms in partial wave expansions, including a bi-orthogonal expansion of the Green's function. However some freedom in the choice of the surface expansion is available since the unknown surface quantities may be expanded in a variety of ways so long as closure is obtained. Out of many possible choices, we develop an optimal method to obtain such expansions which is based on the optimum eigenfunctions related to the surface of the object. In effect, we convert part of the problem (that associated with the Fredholms integral equation of the first kind) an eigenvalue problem of a related Hermitian operator. The methodology will be explained in detail and examples will be presented. DOE

In this paper we consider the problem of approximating a function belonging to some function space by a linear combination of n translates of a given function G. Using a lemma by Jones (1990) and Barron (1991) we show that it is possible to define function spaces and functions G for which the rate of convergence to zero of the error is in any number of dimensions. The apparent avoidance of the curse of dimensionality is due to the fact that these function spaces are more and more constrained as the dimension increases. Examples include spaces of the Sobolev type, in which the number of weak derivatives is required to be larger than the number of dimensions. We give results both for approximation in the L2 norm and in the L(infinity) norm. The interesting feature of these results is that, thanks to the constructive nature of Jones' and Barron's lemma, an iterative procedure is defined that can achieve this rate. GRA

This paper addresses the problem of recovering relative structure, in the form of an invariant, from two views of a 3D scene. The invariant structure is computed without any prior knowledge of camera geometry, or internal calibration, and with the property that perspective and orthographic projections are treated alike, namely, the system makes no assumption regarding the existence of perspective distortions in the input images. We show that, given the location of epipoles, the projective structure invariant can be constructed from only four corresponding points projected from four non-coplanar points in space (like in the case of parallel projection). This result leads to two algorithms for computing projective structure. The first algorithm requires six corresponding points, four of which are assumed to be projected from four coplanar points in space. Alternatively, the second algorithm requires eight corresponding points, without assumptions of coplanarity of object points. Our study of projective structure is applicable to both structure from motion and visual recognition. We use projective structure to re-project the 3D scene from two model images and six or eight corresponding points with a novel view of the scene. The re-projection process is well-defined under all cases of central projection, including the case of parallel projection. GRA

BAYESIAN PREDICTION OF MEAN SQUARE ERRORS WITH COVARIATES
Donald P. Gaver and Patricia A. Jacobs Nov. 1992 37 p
(AD-A259585; NPSOR-93-004) Avail: CASI HC A03/MF A01

Estimation of mean square prediction error of wind components is required in the optimal interpolation (OI) process in numerical prediction of atmospheric variables. Previous work has suggested that statistical models with log-linear scale parameters which include covariates can be used to predict mean square prediction errors. However, the parameters of the statistical relationships appear to change over time. A procedure is described to recursively update the estimated parameters. Data from July of 1991 are used to fit the model parameters and to study the predictive ability of the recursive procedure. This preliminary investigation indicates that observational and first guess wind components can be helpful in predicting mean square prediction error for wind components. GRA

COVERINGS AND NONLOCAL SYMMETRIES
Theo vanBemmelen May 1992 15 p
(MEMO-1057; ETN-93-93194) Avail: CASI HC A03/MF A01

The introduction of potential symmetries, that is special nonlocal symmetries by Bliman, Reid and Kumei, is discussed. The concept of a nonlocal symmetry is aesthetically justified by the theory of coverings. The basic idea is that solutions of the covering system imply solutions of the covered system. Bluman, Kumei and Reid never considered the symmetries lost, that is local symmetries of the covered system that do not extend to local symmetries of the covering system. Examples of coverings that regain these lost symmetries, demonstrating the more natural setting of coverings, are given. ESA

(AD-A260351) Avail: CASI HC A01/MF A01

Much of the research effort during the grant period was devoted to investigations of periodic waves and stability in fluid dynamics. Progress was also made on marching schemes in acoustic wavepropagation. In the area of fluid dynamics, problems relating to spiral flows of a viscous incompressible fluid between concentric cylinders in the narrow gap limit were investigated. When the motion of the fluid is driven by rotating and sliding of the cylinders, the problem is that of rotating, plane, Couette flow; when an axial pressure gradient is added, rotating, plane, Couette-Poiseuille flow ensues. Various such problems for viscous, incompressible flow lead to abstract equations in a Banach space B. GRA

The final report reflects the development of a direct method of solving problems of optimal design of systems described by elliptic equations of the 2nd and 4th order. This method is based on a special 'polysaddle' transformation of the integrand of the corresponding max min - problem applied to construct the appropriate two-sided bounds; an analytical and computational technique is developed to make this construction possible. Geometrical aspects of the above transform are discussed in detail as well as the material implementation of the corresponding layouts. The results obtained provide a theoretical basis for a direct computational assembling of the global layout from special laminar microstructures determined analytically by the aforementioned technique. ANALYTICAL REPRESENTATION OF CONTOURS
Ronald D. Chaney Oct. 1992 46 p
(Contract N00014-91-J-0438)
(AD-A260151; AI-M-1392) Avail: CASI HC A03/MF A01

The interpretation and recognition of noisy contours, such as silhouettes, have proven to be difficult. One obstacle to the solution of these problems has been the lack of a robust representation for contours. In this paper, we present an analytical representation for contours. The contour is represented by a set of pairwise tangent circular arcs. The advantage of such an approach is that mathematical properties such as orientation and curvature are explicitly represented. We introduce a smoothing criterion for the contour that optimizes the tradeoff between the complexity of the contour and proximity of the data points. The complexity measure is the number of extrema of curvature present in the contour. The smoothing criterion leads us to a true scale-space for contours. We describe the computation of the contour representation as well as the computation of relevant properties of the contour. We consider the potential application of the representation, the smoothing paradigm, and the scale-space to contour interpretation and recognition. GRA

A PRIORI ERROR ESTIMATES OF FINITE ELEMENT SOLUTIONS OF PARAMETRIZED NONLINEAR EQUATIONS Final Report
Takuya Tsuchiya and Ivo Babuska Nov. 1992 33 p
(Contract N00014-90-J-1030; NSF CCR-88-20279)
(AD-A260013; BN-1142) Avail: CASI HC A03/MF A01

In this paper, a priori error estimates of finite element solutions of second order parametrized strongly nonlinear equations in divergence form on one-dimensional bounded intervals are studied. The Banach space is chosen in formulation of the error analysis so that the nonlinear differential operators defined by the differential equations are nonlinear Fredholm operators of index 1. Finite element solutions are defined in a natural way, and several a priori estimates are proved on regular branches and on branches around turning points. GRA

(Contract N00014-90-J-1030; NSF CCR-88-20279)
(AD-A260014; BN-1143) Avail: CASI HC A03/MF A01

Nonlinear differential equations with parameters are called parametrized nonlinear equations. This paper studies a posteriori error estimates of finite element solutions of second order parametrized strongly nonlinear equations in divergence form on one-dimensional bounded intervals. In the previous paper by the authors, the finite element solutions are defined, and several a priori estimates are proved on regular branches and on branches around turning points. Using obtained a priori error estimates, we obtain several practical a posteriori error estimates which are asymptotically exact. Some numerical examples are given. GRA

A few years ago, the class of Essentially Non-Oscillatory Schemes for the numerical simulation of hyperbolic equations and systems was constructed. Since then, some extensions have been made to multidimensional simulations of compressible flows, mainly in the context of very regular structured meshes. In this paper, we first recall and improve the results of an earlier paper about non-oscillatory reconstruction on unstructured meshes, emphasizing the effective calculation of the reconstruction. Then we describe a class of numerical schemes on unstructured meshes and give some applications for its third order version. This demonstrates that a higher order of accuracy is indeed obtained, even on very irregular meshes. Author

COMPARISON OF OPERATIONAL AND STANDARD METHODS FOR DATA IN RECTANGULAR ARRAY
G. L. Silver 18 Feb. 1993 28 p
(Contract DE-AC04-88DP-43495)
(DE93-007783; MLM-3773) Avail: CASI HC A03/MF A01

The standard four-point and nine-point methods for interpolating data in rectangular array are compared to operational four-point and nine-point methods. The operational methods usually fit surfaces better than the standard methods. For functions that are continuous, change slowly over the region of interest, and do not contain extrema, one of the operational methods yields reasonable approximations to the coefficients obtained by the least squares method. The Monte Carlo method has been used for many years to analyze the neutronics of nuclear reactors. In fact, as the power of computers has increased the importance of Monte Carlo in neutronics has also increased, and today, this method plays a central role in reactor analysis and design. Monte Carlo is used in neutronics for two somewhat different purposes: (1) to compute the distribution of neutrons in a given medium when the neutron source-density is specified; and (2) to compute the neutron distribution in a self-sustaining chain reaction, in which case the source is determined as the eigenvector of a certain linear operator. In (2), then, the source is not given, but must be computed. In the first case (the 'fixed-source' case) the Monte Carlo calculation is unbiased. That is to say that, if the calculation is repeated ('replicated') over and over, with independent random number sequences for each replica, then averages over all replicas will approach the correct neutron distribution as the number of replicas goes to infinity. Unfortunately, the computation is not unbiased in the second case, which we discuss here. DOE

ON THE PRIOR PROBABILITIES FOR TWO-STAGE BAYESIAN ESTIMATES
P. Kohut 1992 5 p Presented at the Probabilistic Safety Assessment International Topical Meeting (PSA 93), Clearwater Beach, FL, 27-29 Jan. 1993
(Contract DE-AC02-76CH-00016)
(DE93-006389; BNL-NUREG-48226; CONF-930116-35) Avail: CASI HC A01/MF A01

The method of Bayesian inference is reexamined for its applicability and for the required underlying assumptions in obtaining and using prior probability estimates. Two different approaches are suggested to determine the first-stage priors in the two-stage Bayesian analysis which avoid certain assumptions required for other techniques. In the first scheme, the prior is obtained through a true frequency based distribution generated at selected intervals utilizing actual sampling of the failure rate distributions. The population variability distribution is generated as the weighed average of the frequency distributions. The second method is based on a non-parametric Bayesian approach using the Maximum Entropy Principle. Specific features such as integral properties or selected parameters of prior distributions may be obtained with minimal assumptions. It is indicated how various quantiles may also be generated with a least square technique. DOE

IMPROVING THE CHI-SQUARED APPROXIMATION FOR BIVARIATE NORMAL TOLERANCE REGIONS
Alan H. Feiveson Washington Mar. 1993 9 p
(NASA-TP-3304; S-698; NAS 1.60:3304) Avail: CASI HC A02/MF A01

Let X be a two-dimensional random variable distributed according to N2(mu,Sigma) and let bar-X and S be the respective sample mean and covariance matrix calculated from N observations of X. Given a containment probability beta and a level of confidence gamma, we seek a number c, depending only on N, beta, and gamma such that the ellipsoid R = (x: (x - bar-X)'S(exp -1) (x - bar-X) less than or = c) is a tolerance region of content beta and level gamma; i.e., R has probability gamma of containing at least 100 beta percent of the distribution of X. Various approximations for c exist in the literature, but one of the simplest to compute -- a multiple of the ratio of certain chi-squared percentage points -- is badly biased for small N. For the bivariate normal case, most of the bias can be removed by simple adjustment using a factor A which depends on beta and gamma. This paper provides values of A for various beta and gamma so that the simple approximation for c can be made viable for any reasonable sample size. The methodology provides an illustrative example of how a combination of Monte-Carlo simulation and simple regression modelling can be used to improve an existing approximation. Author (revised)

IDENTIFICATION OF SYSTEMS FROM NON-UNIFORMLY SAMPLED DATA
K. M. Tsang (Hong Kong Polytechnic, Kowloon.) and S. A. Billings May 1992 24 p
(RR-452; ETN-93-93493) Avail: CASI HC A03/MF A01

The identification of continuous time models from uniformly sampled data records is investigated and an identification algorithm based on the state variable filter approach is derived. The orthogonal least squares estimator is shown to be adaptable for the identification of continuous time models from nonuniformly sampled data records and instrumental variables are introduced to reduce the bias on stochastic system identification. Multiplying the filtered variables obtained from the state variable filter with higher powers of the noise free output signal prior to the estimation is shown to enhance the parameter estimates. Simulated examples are concluded to illustrate the methods. ESA

Fundamental progress was made in the sequential and fixed sample detection and estimation of abrupt changes in stochastic systems and in the related problem of adaptive control of dynamical systems with time varying parameters. Also studied were recursive estimation and adaptive control of linear stochastic systems, where an essentially complete asymptotic solution was developed for the problem of adaptive estimation of inputs to keep the output of a system close to a fixed target. Advances were made in regression analysis of censored failure time data, inference in nonlinear regression models, and sequential analysis. Related probability theory involving boundary crossing problems and approximate distributions of maxima of random fields was developed. GRA

VALIDATION OF DISTRIBUTED SYSTEMS BY FAULT INJECTION Ph.D. Thesis - Ecole Nationale Superieure de l'Aeronautique et de l'Espace [VALIDATION DE SYSTEMES REPARTIS PAR INJECTION DE FAUTES]
Eliane Martins 1992 155 p In FRENCH; ENGLISH summary
(LAAS-92180; ETN-93-93687) Avail: CASI HC A08/MF A02

Theoretical and practical results concerning the validation of fault tolerant distributed systems using physical fault injection are presented. A test method is proposed that integrates both goals of validation (verification and evaluation), involving the following aspects: definition of a distributed test architecture that supports physical fault injection; selection of test sequences considering faults as an additional test input; determination of whether the observed service satisfies the specified properties; and estimation of the coverage of the fault tolerance mechanisms based on readouts collected during the experiments. To obtain good quality estimations while reducing time and effort of test realization, sampling methods are applied. In particular, the 'missing values' problem (nonsignificant experiments) is tackled by the use of an a posteriori stratification technique, based on groups of equipotential lines affected by the tests. This method was applied during the validation of an open dependable distributed architecture. The results obtained illustrate the important contribution of physical fault injection in the validation of fault tolerant systems. ESA

It has been almost sixty years since Kolmogorov introduced a distribution-free omnibus test for the simple null hypothesis that a distribution function coincides with a given distribution function. Doob subsequently

observed that Kolmogorov's approach could be simplified by transforming the empirical process to an empirical process based on uniform random variables. Recent use of more sophisticated transformations has led to the construction of asymptotically distribution-free omnibus tests when unknown parameters are present. The transformation approach is used to construct an asymptotically distribution-free omnibus test for independence of a survival time from a covariate. The test statistic is obtained from a certain test statistic process (indexed by time and covariate), which is shown to converge in distribution to a Brownian sheet. A simulation study is carried out to investigate the finite sample properties of the proposed test and an application to data from the British Medical Research Council's 4th myelomatosis trial is given. (Grant AF-AFOSR-0259-91)
(AD-A259956; AFOSR-93-0015TR) Avail: CASI HC A03/MF A01

This grant has the central aim of exploring when, and how, probability is useful in the theory of algorithms. Most of the problems reviewed have their origins in the area of Euclidean Combinatorial Optimization, which might be operationally defined as the theory that has evolved out of the study Euclidean traveling salesman problem (TSP), the minimal spanning tree problem, and the minimal matching problem. Probability enters the study of such problems by two different paths. One path calls on exogenous randomization in the course of a genuine probabilistic algorithm. This path is of increasing importance in many areas, and on an elementary level is well illustrated by the method of simulated annealing. A second path of considerable importance calls on the introduction of stochastic models for the problem inputs. One then uses probability theory to understand as deeply as possible the behavior of the associated objective functions. This understanding is used subsequently to guide algorithm design. GRA

STOCHASTIC INFLATION AND INFLATIONARY DENSITY FLUCTUATIONS Ph.D. Thesis
In Su Yi 1992 308 p
Avail: Univ. Microfilms Order No. DA9239380

We examine the stochastic dynamics of chaotic inflation. The non-linear stochastic behavior of inflation is studied with an emphasis on possible non-Gaussian statistics in initial conditions for cosmological large scale structure formation. Large scale non-random phase correlations and interesting dynamical features are analyzed using stochastic dynamics. We solve the stochastic evolution equations for the inflation field during the slow-roll period of chaotic inflation. We find exact analytic solutions for the quartic potential. Although the resulting statistics of the scalar field fluctuations are non-Gaussian, the current cosmic microwave constraint on the strength of the self-coupling for adiabatic fluctuations makes non-Gaussian effects negligibly small. Coarse-grained (long wavelength) scaler fields in stochastic dynamics become nonlinear stochastic variables whose stochastic random evolution is derived from generation and addition of short wave-length quantum noises. The interplay between the classical roll-down and quantum fluctuations makes the evolution of the scaler fields nonclassical. Only during the very late stage of inflation do the fields acquire their classical interpretation. The statistics of initial conditions for cosmological density fluctuations depend on the details of scalar field dynamics during inflation. We point out that initial conditions for large scale structure in inflationary scenarios with the simplest models are Gaussian to a high precision. However, as we consider more finely tuned models of inflation designed to yield special power spectra, Gaussian initial conditions should not be taken for granted, even on astrophysically interesting scales. We use stochastic dynamics to examine the probability of successful inflation from various initial conditions at the Planck epoch. The slow-roll stochastic framework is extended to nonslow-roll evolution. The well-known classical slow-roll attractors exist even when large quantum fluctuations are included. However, a significant fraction of the initial condition phase space which leads to a successful inflationary stage in the classical analysis fails to inflate. Dissert. Abstr.

(NASA-TM-106034; E-7017; NAS 1.15:106034) Avail: CASI HC A03/MF A01

This paper discusses the effects of variations in system parameters on the dynamic behavior of the Free-Piston Stirling Engine/Linear Alternator (FPSE/LA)-load system. The mathematical formulations incorporate both the mechanical and thermodynamic properties of the FPSE, as well as the electrical equations of the connected load. A state-space technique in the frequency domain is applied to the resulting system of equations to facilitate the evaluation of parametric impacts on the system dynamic stability. Also included is a discussion on the system transient stability as affected by sudden changes in some key operating conditions. Some representative results are correlated with experimental data to verify the model and analytic formulation accuracies. Guidelines are given for ranges of the system parameters which will ensure an overall stable operation. Author

A fully coupled mathematical model describing the interactions between a vibrating thin cylindrical shell and enclosed acoustic field is presented. Because the model will ultimately be used in control applications involving piezoceramic actuators, the loads and material contributions resulting from piezoceramic patches bonded to the shell are included in the discussion. Theoretical and computational issues lead to the consideration of a weak form of the modeling set of partial differential equations (PDE's) and through the use of a semigroup formulation, well-posedness results for the system model are obtained. MODELLING A SINGLE PHASE VOLTAGE CONTROLLED RECTIFIER USING LAPLACE TRANSFORMS
L. Alan Kraft (Valparaiso Univ., IN.) and M. David Kankam Sep. 1992 8 p Presented at the 5th International Conference on Harmonics in Power Systems, Atlanta, GA, 22-25 Sep. 1992; sponsored by IEEE
(RTOP 506-41-41)
(NASA-TM-106005; E-7552; NAS 1.15:106005) Avail: CASI HC A02/MF A01

The development of a 20 kHz, AC power system by NASA for large space projects has spurred a need to develop models for the equipment which will be used on these single phase systems. To date, models for the AC source (i.e., inverters) have been developed. It is the intent of this paper to develop a method to model the single phase voltage controlled rectifiers which will be attached to the AC power grid as an interface for connected loads. A modified version of EPRI's HARMFLO program is used as the shell for these models. The results obtained from the model developed in this paper are quite adequate for the analysis of problems such as voltage resonance. The unique technique presented in this paper uses the Laplace transforms to determine the harmonic content of the load current of the rectifier rather than a curve fitting technique. Laplace transforms yield the coefficient of the differential equations which model the line current to the rectifier directly. Author

REVIEW OF QUANTUM COMPUTATION
S. Lloyd 1992 7 p Presented at the International Symposium on Quantum Physics in the Universe, Tokyo, Japan, 19-23 Aug. 1992
(Contract W-7405-eng-36)
(DE93-003735; LA-UR-92-3339; CONF-9208189-1) Avail: CASI HC A02/MF A01

Digital computers are machines that can be programmed to perform logical and arithmetical operations. Contemporary digital computers are 'universal,' in the sense that a program that runs on one computer can, if properly compiled, run on any other computer that has access to enough memory space and time. Any one universal computer can simulate the operation of any other, and the set of tasks that any such machine can perform is common to all universal machines. Since Bennett's discovery that computation can be carried out in a non-dissipative fashion, a number of Hamiltonian quantum-mechanical systems have been proposed whose time-evolutions over discrete intervals are equivalent to those of specific universal computers. The first quantum-mechanical treatment of computers was given by Benioff, who exhibited a Hamiltonian system with a basis whose members corresponded to the logical states of a Turing machine. In order to make the Hamiltonian local, in the sense that its structure depended only on the part of the computation being performed at that time, Benioff found it necessary to make the Hamiltonian time-dependent. Feynman discovered a way to make the computational Hamiltonian both local and time-independent by incorporating the direction of computation in the initial condition. In Feynman's quantum computer, the program is a carefully prepared wave packet that propagates through different computational states. Deutsch presented a quantum computer that exploits the possibility of existing in a superposition of computational states to perform tasks that a classical computer cannot, such as generating purely random numbers, and carrying out superpositions of computations as a method of parallel processing. In this paper, we show that such computers, by virtue of their common function, possess a common form for their quantum dynamics. DOE

SOLUTION OF A CLASS OF STURM-LIOUVILLE PROBLEMS USING THE GALERKIN METHOD WITH GLOBAL BASIS FUNCTIONS
C. Bottcher, M. R. Strayer, and M. F. Werby (National Aeronautics and Space Administration. John C. Stennis Space Center, Bay Saint Louis, MS.) 1992 7 p Presented at the 7th International Conference on Boundary Element Technology, Albuquerque, NM, 3-5 Jun. 1992
(Contract DE-AC05-84OR-21400)
(DE93-005156; CONF-920664-4) Avail: CASI HC A02/MF A01

Many problems in physics and engineering can be reduced to the Sturm-Liouville (S-L) Problem. For some classes of the S-L problem we develop a method that can rapidly result in computational solutions. Let us assume that we can write the problem as follows: d(sup 2)U(sub i)r/dr(sup 2) + (K(r) - gamma(sub i))U(sub i)r = 0 where L is an eigenvalue and K(r) is some well behaved (i.e. positive definite) function of r. Now let k correspond to some average value of K(r) over the domain of K(r). The boundary conditions are general. Then we easily solve the following problem: d(sup 2)psi(sub i)(r)/dr(sup 2) + (k - gamma(sub i))psi(sub i)(r) = 0. This yields global basis functions. We determine an efficient method to obtain solutions of the form: U(sub i) = Sigma(sub i=1)(sup N)a(sub ij)psi(sub j) in which we determine the best expansion coefficients a(sub ij) as well as the eigenvalues L(sub i)'s in terms of the 1(sub i)'s and the a(sub ij)'s. We also develop several perturbation methods from the technique. The method is then applied to typical problems found in acoustics and quantum mechanics. DOE

REDUCED MASS PERSISTENT SWITCHES FOR LARGE SUPERCONDUCTING MAGNETS IN SPACE
M. A. Green Aug. 1992 4 p Presented at the Applied Superconductivity Conference, Chicago, IL, 23-28 Aug. 1992
(Contract DE-AC03-76SF-00098)
(DE93-004782; LBL-32979; CONF-920802-44) Avail: CASI HC A01/MF A01

Superconducting magnets in space must operate in the persistent mode. The characteristics of low mass niobium titanium persistent switches for low mass superconducting magnets which are designed to quench protect themselves through the quench back process are described. (The whole coil is driven normal shortly after the quench has started and the magnet stored energy is taken up by the coil and the persistent switch.) The concept of using a resistor and diode in parallel with the persistent switch to reduce the overall mass of the persistent switch system and the helium consumption during magnet charging is discussed. A 1.4 meter diameter free-flyer version of the 11.6 MJ stored energy ASTROMAG magnet and its persistent switch is presented as an example. DOE

STABILITY ANALYSIS AND MODELING OF ROTATING FLEXIBLE STRUCTURES Ph.D. Thesis
Clark Richard Dohrmann 1992 149 p
Avail: Univ. Microfilms Order No. DA9238162

Equations of motion are developed for undamped, rotating flexible structures free of applied forces and moments. The development is based upon the use of a floating reference frame which follows the overall rigid body motion of the structure. Within this frame, elastic deformations are expressed as functions of n generalized degrees of freedom. A nonlinear transformation of variables is devised which shows the equivalence of the equations of motion to a Hamiltonian system with n + 1 degrees of freedom. A method is developed for the stability analysis of flexible structures rotating about this axis of minimum moment of inertia. Central to the development is the equivalence established between the governing equations and a Hamiltonian system. It is shown that unstable motion can occur only if a certain characteristic frequency of the system is involved in a lower-order resonance relation. Stability criteria for systems satisfying a single resonance relation are developed in detail. General guidelines are also provided for assessing the stability of systems possessing multiple resonance relations. Examples are provided which demonstrate the application of the stability criteria. Results obtained from numerical integration of the equations of motion are shown to be consistent with the predictions of stability analyses. It also shows that motion which is stable in the linear approximation may be unstable when nonlinear terms are included. A new method for modeling the dynamics of rotating flexible structures is developed and investigated. The method is similar to conventional assumed displacement approaches with the addition that quadratic terms are retained in the kinematics of deformation. Retention of these terms is shown to account for the geometric stiffening effects which occur in rotating structures. Computational techniques are developed for the practical implementation of the new method. The techniques make use of finite element analysis results, and thus are applicable to a wide variety of structures. Motion studies of specific problems are provided to demonstrate the validity of the method. Excellent agreement is found both with results from the literature and ones obtained from a commercial finite element analysis code. The computational advantages of the method are demonstrated.

The detailed study of few-body systems provides one of the most precise tools for studying the dynamics of nuclei and nucleons. This research program consists of a careful theoretical study of few-body systems and methods for modeling these systems. During the past year several aspects of this program were completed. Brief summaries are given of work on the following topics: the relativistic three quark problem; the relativistic Balian-Brezin method; spin in light front quantum mechanical models; proton-deutron scattering and reactions; point form relativistic quantum mechanics of constituents; solutions of quantum mechanical anharmonic oscillators; and shift operators and the U(N) multiplicity problem. FESDIF: FINITE ELEMENT SCALAR DIFFRACTION THEORY CODE
H. G. Kraus Sep. 1992 242 p
(Contract DE-AC07-76ID-01570)
(DE93-007222; EGG-APO-10531) Avail: CASI HC A11/MF A03

This document describes the theory and use of a powerful scalar diffraction theory based computer code for calculation of intensity fields due to diffraction of optical waves by two-dimensional planar apertures and lenses. This code is called FESDIF (Finite Element Scalar Diffraction). It is based upon both Fraunhofer and Kirchhoff scalar diffraction theories. Simplified routines for circular apertures are included. However, the real power of the code comes from its basis in finite element methods. These methods allow the diffracting aperture to be virtually any geometric shape, including the various secondary aperture obstructions present in telescope systems. Aperture functions, with virtually any phase and amplitude variations, are allowed in the aperture openings. Step change aperture functions are accommodated. The incident waves are considered to be monochromatic. Plane waves, spherical waves, or Gaussian laser beams may be incident upon the apertures. Both area and line integral transformations were developed for the finite element based diffraction transformations. There is some loss of aperture function generality in the line integral transformations which are typically many times more computationally efficient than the area integral transformations when applicable to a particular problem.

ANTI-GRAVITY: THE KEY TO 21ST CENTURY PHYSICS
H. P. Noyes Jan. 1993 13 p Presented at the 14th Annual Meeting of the Alternative Natural Philosophy Association, Cambridge, England, 3-6 Sep. 1992
(Contract DE-AC03-76SF-00515)
(DE93-006929; SU-SLAC-PUB-5857; CONF-9209297-1) Avail: CASI HC A03/MF A01

The masses coupling constants and cosmological parameters obtained using our discrete and combinatorial physics based on discrimination between bit-strings indicate that we can achieve the unification of quantum mechanics with relativity which had become the goal of twentieth century physics. To broaden our case we show that limitations on measurement of the position and velocity of an individual massive particle observed in a colliding beam scattering experiment imply real, rational commutation relations between position and velocity. Prior to this limit being pushed down to quantum effects, the lower bound is set by the available technology, but is otherwise scale invariant. Replacing force by force per unit mass and force per unit charge allows us to take over the Feynman-Dyson proof of the Maxwell Equations and extend it to weak gravity. The crossing symmetry of the individual scattering processes when one or more particles are replaced by anti-particles predicts both Coulomb attraction (for charged particles) and a Newtonian repulsion between any particle and its anti-particle. Previous quantum results remain intact, and predict the expected relativistic fine structure and spin dependencies. Experimental confirmation of this anti-gravity prediction would inaugurate the physics of the twenty-first century. DOE

VIBRATION PATTERN IMAGER (VPI): A CONTROL AND DATA ACQUISITION SYSTEM FOR SCANNING LASER VIBROMETERS
Stephen A. Rizzi, Donald E. Brown (Lockheed Engineering and Sciences Co., Hampton, VA.), and Thomas A. Shaffer Jan. 1993 32 p
(RTOP 505-63-50-10)
(NASA-TM-107721; NAS 1.15:107721) Avail: CASI HC A03/MF A01

The Vibration Pattern Imager (VPI) system was designed to control and acquire data from scanning laser vibrometer sensors. The PC computer based system uses a digital signal processing (DSP) board and an analog I/O board to control the sensor and to process the data. The VPI system was originally developed for use with the Ometron VPI Sensor, but can be readily adapted to any commercially available sensor which provides an analog output signal and requires analog inputs for control of mirror positioning. The sensor itself is not part of the VPI system. A graphical interface program, which runs on a PC under the MS-DOS operating system, functions in an interactive mode and communicates with the DSP and I/O boards in a user-friendly fashion through the aid of pop-up menus. Two types of data may be acquired with the VPI system: single point or 'full field.' In the single point mode, time series data is sampled by the A/D converter on the I/O board (at a user-defined sampling rate for a selectable number of samples) and is stored by the PC. The position of the measuring point (adjusted by mirrors in the sensor) is controlled via a mouse input. The mouse input is translated to output voltages by the D/A converter on the I/O board to control the mirror servos. In the 'full field' mode, the measurement point is moved over a user-selectable rectangular area. The time series data is sampled by the A/D converter on the I/O board (at a user-defined sampling rate for a selectable number of samples) and converted to a root-mean-square (rms) value by the DSP board. The rms 'full field' velocity distribution is then uploaded for display and storage on the PC. Author

AEROACOUSTIC DIFFRACTION AND DISSIPATION BY A SHORT PROPELLER COWL IN SUBSONIC FLIGHT Final Report
Rudolph Martinez Apr. 1993 72 p
(Contract NAS3-26598; RTOP 535-03-10)
(NASA-CR-190801; E-7717; NAS 1.26:190801) Avail: CASI HC A04/MF A01

This report develops and applies an aeroacoustic diffraction theory for a duct, or cowl, placed around modelled sources of propeller noise. The regime of flight speed is high subsonic. The modelled cowl's inner wall contains a liner with axially variable properties. Its exterior is rigid. The analysis replaces both sides with an unsteady lifting surface coupled to a dynamic thickness problem. The resulting pair of aeroacoustic governing equations for a lined 'ring wing' is valid both for a passive and for an active liner. Their numerical solution yields the effective dipole and monopole distributions of the shrouding system and thereby determines the cowl-diffracted component of the total radiated field. The sample calculations here include a preliminary parametric search for that liner layout which maximizes the cowl's shielding effectiveness. The main conclusion of the study is that a short cowl, passively lined, should provide moderate reductions in propeller noise. Author (revised)

(Contract NAS9-17900; RTOP 537-03-21-01)
(NASA-CR-189715; NAS 1.26:189715) Avail: CASI HC A04/MF A01

A study was performed to determine the feasibility of establishing if a 'shaped' sonic boom signature, experimentally shown in wind tunnel models out to about 10 body lengths, will persist out to representative flight conditions of 200 to 300 body lengths. The study focuses on the use of a relatively large supersonic remotely-piloted and recoverable vehicle. Other simulation methods that may accomplish the objective are also addressed and include the use of nonrecoverable target drones, missiles, full-scale drones, very large wind tunnels, ballistic facilities, whirling-arm techniques, rocket sled tracks, and airplane nose probes. In addition, this report will also present a background on the origin of the feasibility study including a brief review of the equivalent body concept, a listing of the basic sonic boom signature characteristics and requirements, identification of candidate vehicles in terms of desirable features/availability, and vehicle characteristics including geometries, area distributions, and resulting sonic boom signatures. A program is developed that includes wind tunnel sonic boom and force models and tests for both a basic and modified vehicles and full-scale flight tests. Author (revised)

ZERO SOUND EXPERIMENTS IN SUPERFLUID He3 Ph.D. Thesis
Kiyoshi Torizuka 1991 51 p Sponsored by Koerber Foundation, Hamburg, Germany, and Academy of Finland
(ISBN-951-22-0841-5; ETN-93-93474) Avail: CASI HC A04/MF A01

Ultrasonic experiments in the superfluid phases of helium 3 were carried out in the rotating nuclear demagnetization cryostat ROTA2. The real squashing mode spectroscopy on rotating B phase helium 3 is described, and the behavior of sound attenuation in A phase helium 3 at low temperatures and pressure is examined. The rotation response of the sound attenuation in the A(sub 1) phase is also described. Two phonon absorption by the real squashing mode in B phase helium 3, which is the analog of two photon absorption in nonlinear optics, is discussed. The investigation of the phase diagram of rotating A phase helium 3 in low magnetic fields is presented. ESA

ACOUSTIC EMISSION OF STRUCTURAL MATERIALS EXPOSED TO OPEN FLAMES

William Grosshandler and Margaret Jackson Dec. 1992 27 p
(PB93-138980; NISTIR-4984) Avail: CASI HC A03/MF A01

The use of acoustic emission (AE) as an early indicator of a hidden structural fire has been investigated and found to be a viable, but undeveloped, concept. Piezoelectric transducers have been mounted directly on 0.5 m long, simply supported beams of different structural materials (aluminum, gypsum board, wood, and plastic), and have been used to record ultrasonic events resulting from a small flame placed under the beam. The number of AE events in a minute and the cumulative energy released during the heating cycle provide a good measure of the overheated state of some of these materials even before a temperature increase is indicated. The measured signals varied in energy and number with the type of material, the thickness of the specimen, and heat flux. Wood was particularly susceptible to acoustic emission, producing more than 1000 events per minute in a solid fir board and 30/min in a 13 mm thick plywood when the flame exceeded 1.0 kW. A gypsum board produced 16 events in a minute. An aluminum plate did not respond above the background level (0.3 events/minute) even though it reached the highest temperature. The differences in cumulative energy were equally striking, with the plywood being four times more energetic than the gypsum board even though the heating period for the wood was half as long, and 30 times more energetic than the aluminum. AN ASYMPTOTIC THEORY OF SUPERSONIC PROPELLER NOISE Final Report

Edmane Envia May 1992 20 p Presented at the 14th Aeroacoustics Conference, Aachen, Germany, 11-14 May 1992; sponsored by DGLR and AIAA Previously announced in IAA as A93-19169
(Contract NAS3-25266; RTOP 535-03-10)
(NASA-CR-191110; E-7723; NAS 1.26:191110) Avail: CASI HC A03/MF A01

A theory for predicting the noise field of supersonic propellers with realistic blade geometries is presented. The theory, which utilizes a large-blade-count approximation, provides an efficient formula for predicting the radiation of sound from all three sources of propeller noise. Comparisons with a full numerical integration indicate that the levels predicted by this formula are quite accurate. Calculations also show that, for high speed propellers, the noise radiated by the Lighthill quadrupole source is rather substantial when compared with the noise radiated by the blade thickness and loading sources. Results from a preliminary application of the theory indicate that the peak noise level generated by a supersonic propeller initially increases with increasing tip helical Mach number, but is eventually reaches a plateau and does not increase further. The predicted trend shows qualitative agreement with the experimental observations. Author

TILTROTOR AIRCRAFT NOISE: A SUMMARY OF THE PRESENTATIONS AND DISCUSSIONS AT THE 1991 FAA/GEORGIA TECH WORKSHOP Final Report

K. K. Ahuja Jan. 1992 55 p
(Contract DTFA01-87-C-0014)
(AD-A260072; A8924-1; DOT/FAA/RD-91/23) Avail: CASI HC A04/MF A01

Georgia Institute of Technology hosted a workshop in Atlanta on 28-29 Mar. 1991 on the noise problems associated with tiltrotors. The workshop had two major objectives: (1) to review the status of research and development in predicting and reducing tiltrotor noise; and (2) to identify key technical and operational issues and methods to address them. The second objective had both near term and far term implications. In the near term, the goal is to arrive at a level of technical credibility that can support decisions to develop urban and inner city markets. The long term goal is to target resources and actions which will lead to tiltrotor noise abatement and effective control. The opening session consisted of an overview and a discussion of the physics of tiltrotor noise mechanisms. A review of the available experiment data followed. A discourse on potential flight operational procedures to minimize noise impacts, and a general presentation of industry and government perspectives concluded the workshop. Subsequent sessions were available for participants to present observations on and experiences with the XV-15 and V-22. Operational experiences included flight tests, wind tunnel tests, and other simulations. Experiences with computational fluid dynamics codes, small-scale model testing, and other related research were shared. A summary of the presentations and discussions are provided. Author (revised)

THE ACOUSTICAL IMPEDANCE AT THE JUNCTION OF NON-COAXIAL CYLINDRICAL DUCTS

K. S. Peat Apr. 1992 15 p
(MATHS-Rept-A-157; ETN-93-93563) Avail: CASI HC A03/MF A01

An investigation of the situation where ducts at a sudden area change are not coaxial is presented. At low frequencies, only plane waves can continuously propagate along uniform ducts, but evanescent non planar waves arise from discontinuities in the duct cross section. The effect of these evanescent waves can be considered as an acoustical impedance to the propagation of plane waves. It is then possible to increase the accuracy of low frequency planewave analysis of duct systems with cross sectional discontinuities, by inclusion of these impedance corrections. ESA

LOW ALTITUDE ACOUSTIC PROPAGATION ANALYSIS BY USE OF A THREE-DIMENSIONAL PARABOLIC WAVE EQUATION Ph.D. Thesis - Ecole Centrale de Lyon, 1991 [ANALYSE DE LA PROPAGATION ACOUSTIQUE A BASSE ALTITUDE PAR L'EQUATION PARABOLIQUE TRIDIMENSIONNELLE]

Yves Delrieux 1992 156 p In FRENCH
(ONERA-P-1992-1; ETN-93-93521) Avail: CASI HC A08/MF A02

A numerical method based on parabolic approximation used in the investigation of long range sound propagation in the atmosphere near the ground, in order to predict noise levels of industrial plants, traffic or aircraft is discussed. It can be described by means of numerical resolution of the wave equation. The two Dimensional Parabolic Equation (2PDE) is generally applied to describe sound propagation from a point source in a media which is assumed to be cylindrically symmetric. The aim is to study the three dimensional effects in sound propagation by use of the 3DPE. A numerical method for solving the 3DPE is presented and an implicit finite difference scheme based on the alternating directions method is formulated. The validity of the 3DPE is shown by comparison with measurements carried out in an anechoic chamber where the diffraction behind a thin barrier of finite length is studied. The 3D effects of wind and topology are shown by experimentations carried out in a wind tunnel for different types of wedges and screens. ESA

AIRCRAFT OVERFLIGHT STUDY: EFFECT OF AIRCRAFT ALTITUDE UPON SOUND LEVELS AT THE GROUND

Grant S. Anderson and Richard D. Horonjeff Mar. 1992 80 p Sponsored by National Park Service, Denver, CO
(Contract NPS-DSC-CX-2000-0-0025)
(PB93-144194; HMMH-290940.02; NPOA-91-4) Avail: CASI HC A05/MF A01

The report summarizes that literature review, discussing sound divergence, atmospheric absorption, attenuation due to intervening hills and heavily wooded areas, soft-ground attenuation, and the acoustical descriptors that are of potential concern to the Park Service as the aircraft flies by the area. Finally, the report concludes with a summary of the effect of aircraft altitude upon sound levels on the ground, taking all these

factors into account. Included in the summary is a discussion of the potential acoustical effectiveness of using altitude as a mitigation measure for any adverse effects of aircraft sound within the National Park System. GRA

FIBER OPTIC MICROPHONE HAVING A PRESSURE SENSING REFLECTIVE MEMBRANE AND A VOLTAGE SOURCE FOR CALIBRATION PURPOSE Patent
Allan J. Zuckerwar, inventor (to NASA), Frank W. Cuomo, inventor (to NASA), and William E. Robbins, inventor (to NASA) 6 Apr. 1993 16 p Filed 3 Jun. 1992 Division of US-Patent-Appl-SN-586369, filed 21 Sep. 1990
(NASA-Case-LAR-14402-2-CU; US-Patent-5,200,610; US-Patent-Appl-SN-894504; US-Patent-Class-250-227.21; US-Patent-Class-250-231.19; US-Patent-Class-364-571.01; Int-Patent-Class-H01J-40/14) Avail: US Patent and Trademark Office

A fiber optic microphone is provided for measuring fluctuating pressures. An optical fiber probe having at least one transmitting fiber for transmitting light to a pressure-sensing membrane and at least one receiving fiber for receiving light reflected from a stretched membrane is provided. The pressure-sensing membrane may be stretched for high frequency response. Further, a reflecting surface of the pressure-sensing membrane may have dimensions which substantially correspond to dimensions of a cross section of the optical fiber probe. Further, the fiber optic microphone can be made of materials for use in high temperature environments, for example greater than 1000 F. A fiber optic probe is also provided with a back plate for damping membrane motion. The back plate further provides a means for on-line calibration of the microphone.

AIRCRAFT OVERFLIGHT STUDY RECOMMENDED PLAN: DETAILED SAMPLING, DATA COLLECTION AND DATA ANALYSIS PLANS FOR THE VISITOR SURVEY AND THE DOSE-RESPONSE SURVEY
Robert M. Baumgartner, Cary McDonald, Ronald Iachan, Grant S. Anderson, Richard D. Horonjeff, Christopher W. Menge, and Nicholas P. Miller Apr. 1992 145 p Sponsored by National Park Service Prepared in cooperation with HBRS, Inc., Madison, WI, and Research Triangle Inst., Research Triangle Park, NC
(Contract NPS-DSC-CX-2000-0-0025)
(PB93-144186; HMMH-290940.08; NPOA-91-6) Avail: CASI HC A07/MF A02

The report describes the recommended study design for an National Park Service (NPS) area visitor survey and a dose-response study to be conducted as part of the research for the NPS Aircraft Overflight Study. The NPS Aircraft Overflight Study is based upon the directives for research contained Public Law 100-91. That document states that the study should: (1) determine the proper minimum altitude for aircraft flying over park units; (2) identify any problems associated with aircraft overflights of park units; (3) provide information regarding the types of overflights which may impact park units; (4) distinguish between impacts caused by different types of aircraft activity; and (5) identify park system units and portions where the most serious impacts exist. ELECTRON IMPACT EXCITATION CROSS SECTION MEASUREMENTS OF HIGHLY CHARGED HELIUMLIKE AND LITHIUMLIKE IONS
K. L. Wong, P. Beiersdorfer, R. E. Marrs, K. J. Reed, and D. A. Vogel 15 Sep. 1992 4 p Presented at the 6th International Conference on Physics of Highly Charged Ions, Manhattan, KS, 28 Sep. - 2 Oct. 1992
(Contract W-7405-eng-48)
(DE93-003478; UCRL-JC-111467; CONF-920948-9) Avail: CASI HC A01/MF A01

The cross sections for electron impact excitation of the heliumlike forbidden line z, intercombination lines y and x, and the resonance line w, together with the associated lithiumlike satellites lines q, r, t, u, and v have been measured for Ti, V, Cr, Mn, and Fe on the Livermore electron beam ion trap. The measurements were made near the threshold for excitation of the heliumlike transitions where no other processes can contribute to the excitation of the lines. The uncertainties in the measurements are up to 15 percent for the heliumlike transitions and between 14 and 27 percent for the lithiumlike transitions. We find good agreement with results from a distorted-wave calculation. DOE

ELECTRON TRANSFER, IONIZATION, AND EXCITATION IN ATOMIC COLLISIONS
1992 4 p
(Contract DE-FG02-86ER-13549)
(DE93-005918; DOE/ER-13549/7) Avail: CASI HC A01/MF A01

Fundamental processes of electron transfer, ionization, and excitation in ion-atom and ion-ion collisions are studied. Attention is focussed on one- and two-electron systems and, more recently, quasi-one-electron systems whose electron-target-ion core can be accurately modeled by one-electron potentials. The basic computational approaches can then be taken with few, if any, approximations, and the underlying collisional mechanisms can be more clearly revealed. At intermediate collision energies (e.g., proton energies for p-He(+) collisions on the order of 100 kilo-electron volts), many electronic states are strongly coupled during the collision, a coupled-state approach, such as a coupled-Sturmian-pseudostate approach, is appropriate. At higher collision energies (million electron-volt energies) the coupling is weaker with, however, many more states being coupled together, so that high-order perturbation theory is essential. DOE

COLOR SEXTET QUARKS AND NEW HIGH-ENERGY INTERACTIONS
A. R. White and Kyungsik Kang (Brown Univ., Providence, RI.) 28 Oct. 1992 8 p Presented at the 7th International Symposium on Very High Energy Cosmic Ray Interactions, Ann Arbor, MI, 21-27 Jun. 1992
(Contract W-31-109-eng-38)
(DE93-004187; ANL-HEP-CP-92-90; BROWN-HET-883; CONF-9206284-2) Avail: CASI HC A02/MF A01

We review the implications of adding a flavor doublet of color sextet quarks to QCD. Theoretical attractions include--'minimal' dynamical symmetry breaking of the electroweak interaction, solution of the Strong CP problem via the 'heavy axion' eta(sub 6), and Critical Pomeron Scaling at asymptotic energies. Related experimental phenomena, which there may be evidence for, include--production of the eta(sub 6) at LEP, large cross-sections for W(sup +)W(sup -) and Z(sup 0)Z(sup 0) pairs and very high energy jets in hadron colliders, and a hadronic threshold above which high-energy 'exotic' diffractive processes appear in Cosmic Ray events. FROM SIMPLE TO COMPLEX REACTIONS: NUCLEAR COLLISIONS NEAR THE COULOMB BARRIER
K. E. Rehm 1992 15 p Presented at the 27th Zakopane School of Physics Conference, Zakopane, Poland, 31 Aug. - 3 Sep. 1992
(Contract W-31-109-eng-38)
(DE93-004197; ANL/PHY/CP-77920; CONF-9208190-1) Avail: CASI HC A03/MF A01

Collisions between two heavy nuclei produce a diverse spectrum of

reaction modes which is much wider than that observed in light ion studies. For the latter case, two processes are observed: direct reactions and compound nucleus formation. Heavy ion reaction studies on the other hand have identified additional processes such as deep-inelastic scattering, incomplete fusion, and quasi-fission reactions. While the boundaries between the various processes are usually not well defined, it is generally accepted that with increasing overlap of the two nuclei, the interaction evolves from distant collisions where only elastic scattering and Coulomb excitation processes occur, through grazing-type collisions associated with quasi-elastic reactions to deep-inelastic and fusion-fission processes requiring a substantial nuclear overlap. Varying the bombarding energy is a convenient way to change the overlap of the two nuclei. Measurements of excitation functions can thus probe the onset and the interplay of the various reaction modes. Experiments at bombarding energies in the vicinity of the Coulomb barrier are particularly suited for comparisons with theoretical predictions since the small number of degrees of freedom involved in the interaction greatly simplifies the calculations. In the first part of this contribution a short overview is given on the status of heavy ion reaction studies at energies in the vicinity of the Coulomb barrier. In the second part, two experiments, one involving simple and the other studying complex reactions, are discussed in more detail. DOE

DIRECT SEARCHES FOR NEUTRINO MASS
J. F. Wilkerson 1992 11 p Presented at the 15th International Conference on Neutrino Physics, Granada, Spain, 7-13 Jun. 1992
(Contract W-7405-eng-36)
(DE93-003867; LA-UR-92-3956; CONF-9206227-4) Avail: CASI HC A03/MF A01

At present there is no positive experimental evidence that neutrinos have mass. Nevertheless, searches for neutrino mass continue, largely because the consequences of neutrinos having mass would be quite profound. In particular, the discovery of a non-zero neutrino mass would be a clear indication of physics beyond the current particle-physics standard model. In addition, neutrinos, if they have mass, remain viable candidates for the non-baryonic dark matter known to permeate galaxies. The current status of the experimental efforts searching for neutrino mass will be reviewed. In particular, it will be shown that the most recent tritium beta decay searches for neutrino mass clearly rule out the non-zero neutrino mass result first reported in 1980 by the Institute for Theoretical and Experimental Physics (ITEP) in Moscow. However, a troubling feature of these same recent results is that they all have best fits to neutrino mass squared that are negative. The significance of these negative neutrino mass squared results will be explored. DOE

A MASSIVE NEUTRINO IN NUCLEAR BETA DECAY?
E. B. Norman, Yuen-Dat Chan, A. Garcia, K. T. Lesko, R. M. Larimer, R. G. Stokstad, B. Sur, I. Zlimen, and M. T. F. daCruz Aug. 1992 5 p Presented at the ICHEP-26: 26th International Union of Pure and Applied Physics (IUPAP) Conference on High Energy Physics, Dallas, TX, 6-12 Aug. 1992
(Contract DE-AC03-76SF-00098)
(DE93-004718; LBL-32953; CONF-920837-30) Avail: CASI HC A01/MF A01

We have continued our studies of the p-spectrum of C-14 using a germanium detector doped with C-14. There is a feature in the beta-spectrum 17 keV below the endpoint which could be explained by the hypothesis that there is a heavy neutrino emitted in the beta-decay of C-14 with a mass of 17 +/- 1 keV and an emission probability of 1.26 +/- 0.25 percent. However, we also have performed a high statistics measurement of the inner bremsstrahlung spectrum of Fe-55 and find no indication of the emission of a 17-keV neutrino. We conclude that the origin of the 'kink' that has been observed in some recent beta spectral measurements is not a neutrino. DOE

HIGH PRESSURE HETEROGENEOUS CATALYSIS IN A LOW PRESSURE ULTRAHIGH VACUUM ENVIRONMENT
S. T. Ceyer 1992 5 p
(Contract DE-FG02-89ER-14035)
(DE93-005917; DOE/ER-14035/T2) Avail: CASI HC A01/MF A01

An apparatus was developed which couples high resolution electron energy loss spectroscopy with molecular beam and scattering techniques. Exposure of Ni(111) to atomic H results in H embedded within the Ni lattice and a monolayer of H adsorbed on the surface. This surface-bound H was removed by an Xe atom beam. Subsequent exposure to CH4 results in dissociative adsorption, producing adsorbed CH3, and adsorbed H. Results document a new mechanism for a surface reaction, a reaction between an adsorbed and a bulk species, and demonstrate the importance of bulk H as a reactant in a heterogeneous catalytic reaction. DOE

EXCPACK: A PACKAGE OF CODES FOR ELECTRON IMPACT EXCITATION OF IONS BY A DISTORTED WAVE METHOD
J. B. Mann Dec. 1992 130 p
(Contract W-7405-eng-36)
(DE93-006095; LA-12394-MS) Avail: CASI HC A07/MF A02

EXCPACK is a package of codes and sample data decks for calculation of ion or atom excitation by electron impact. Programs RCN32 and ARRANGE produce the necessary orbital wavefunctions in form for the main program EXCITE. This program is for excitation between 'pure' LS-coupled basis functions. Two auxiliary programs, RCN2 and RCG2, calculate the mix, or composition, of LS basis functions in the actual configurations of interest. The RCG9 program also calculates various atomic energy levels, to provide any unknown excitation threshold energies. Program MIX uses the matrix elements from multiple EXCITE runs to include the effects of intermediate coupling and configuration interaction. The results from MIX are tabulated for level-to-level transitions as well as the average configuration-to-configuration transition. Auxiliary programs SORTAPE, COMBINE, UNITARY, and TAP3ED are described. Writeups of some of the programs are included here as appendixes. The package is available on a 3.5 in. PC-diskette from Group T-4 of this Laboratory. DOE

MESON FORM-FACTORS AND WAVE-FUNCTIONS WITH WILSON FERMIONS
Rajan Gupta, David Daniel, and Jeffrey Grandy 1992 4 p Presented at the LATTICE 1992: Lattice field theory, Amsterdam, Netherlands, 15-19 Sep. 1992
(Contract W-7405-eng-36)
(DE93-003859; LA-UR-92-3857; CONF-9209276-2) Avail: CASI HC A01/MF A01

Results for semi-leptonic form-factors for the process D-Klv and the Bethe-Sathe-Salpeter amplitudes (BSA) for pion and eho mesons are presented. The form-factor data is consistent with previous calculations.

We find that the long distance fall-off BSA for both pi and pho is very well fit by an exponential, but surprisingly the effective mass governing the fall-off is lighter than the pion's. Lastly, by studying the dependence of pho polarization on separation direction we show that there is a measureable I=2 state in addition to I=0 in the BSA for the pho. GRA

Experiment 791 at Fermilab's Tagged Photon Laboratory has just accumulated a high statistics charm sample by recording 20 billion events on 24000 8mm tapes. A 500 GeV/c pi(-) beam was used with a fixed target and a magnetic spectrometer which now includes 23 silicon microstrip planes for vertex reconstruction. A new data acquisition system read out 9000 events/sec during the part of the Tevatron cycle that delivered beam. Digitization and readout took 50 microS per event. Data was buffered in eight large FIFO memories to allow continuous event building and continuous tape writing to a wall of 42 Exabytes at 9.6 MB/sec. The 50 terabytes of data buffered to tape is now being filtered on RISC CPU's. Preliminary results show D(sup 0) yields K(-)pi(+) and D(+) yields K(-)pi(-)pi(+) decays. Rarer decays will be pursued. DOE

A STUDY OF FOUR-JET EVENTS AND SEARCH FOR DOUBLE PARTON INTERACTIONS AT SQUARE ROOT OF s = 1.8 TeV

L. J. Keeble (Texas A&M Univ., College Station.) Nov. 1992 5 p Presented at the Meeting of the Division of Particles and Fields of the American Physics Society, Batavia, IL, 10-14 Nov. 1992

(Contract DE-AC02-76CH-03000)

(DE93-005973; FNAL/C-92/339-E; CONF-921122-23) Avail: CASI HC A01/MF A01

Kinematic properties of four-jet events in bar-p p collisions at sqr. of s = 1.8 TeV are compared with the predictions of leading order quantum chromodynamics. We place an upper limit on the double parton scattering cross of sigma(sub DP) less than 120 nb (95 percent C.L.) for partons with transverse momenta greater than 18 GeV/c. Defining the effective cross section sigma(sub eff) through the equation of sigma(sub eff) = sigma(sub DP) = sigma(sub dijet)(exp 2)/sigma(sub eff)), where (sigma)(sub dijet) is the cross section for two-jets events, the limit sigma(sub eff) greater than 3.9 mb (95 percent C.L.) is also placed. Implications for physics at the SSC (sqr. of s = 40 TeV) are discussed. DOE

N93-22712# Massachusetts Inst. of Tech., Cambridge.

SPECTROSCOPIC AND DYNAMICAL STUDIES OF HIGHLY ENERGIZED SMALL POLYATOMIC MOLECULES

1992 12 p

(Contract DE-FG02-87ER-13671)

(DE93-006504; DOE/ER-13671/10) Avail: CASI HC A03/MF A01

Stimulated emission pumping (SEP) spectroscopy was used on acetylene and on formyl radical. An attempt was made for pattern recognition based on statistics; a method was invented that combined CNPI (complete nuclear permutation-inversion) group theory and SCC (spectral cross-correlation). But the direction away from statistical pattern recognition back to traditional spectroscopic pattern recognition was taken. Vibrational states and quantum numbers are discussed. For the formyl radical, the fluorescence excitation spectrum was recorded and a rotational analysis of the 0(sup 0)(sub 0) band performed. DOE

ADVANCED COMPUTATIONAL METHODS FOR NODAL DIFFUSION, MONTE CARLO, AND S(SUB N) PROBLEMS

W. R. Martin Jan. 1993 28 p

(Contract DE-FG02-92ER-75709)

(DE93-006816; DOE/ER-75709/1) Avail: CASI HC A03/MF A01

This document describes progress on five efforts for improving effectiveness of computational methods for particle diffusion and transport problems in nuclear engineering: (1) Multigrid methods for obtaining rapidly converging solutions of nodal diffusion problems. An alternative line relaxation scheme is being implemented into a nodal diffusion code. Simplified P2 has been implemented into this code. (2) Local Exponential Transform method for variance reduction in Monte Carlo neutron transport calculations. This work yielded predictions for both 1-D and 2-D x-y geometry better than conventional Monte Carlo with splitting and Russian Roulette. (3) Asymptotic Diffusion Synthetic Acceleration methods for obtaining accurate, rapidly converging solutions of multidimensional SN problems. New transport differencing schemes have been obtained that allow solution by the conjugate gradient method, and the convergence of this approach is rapid. (4) Quasidiffusion (QD) methods for obtaining accurate, rapidly converging solutions of multidimensional SN Problems on irregular spatial grids. A symmetrized QD method has been developed in a form that results in a system of two self-adjoint equations that are readily discretized and efficiently solved. (5) Response history method for speeding up the Monte Carlo calculation of electron transport problems. This method was implemented into the MCNP Monte Carlo code. In addition, we have developed and implemented a parallel time-dependent Monte Carlo code on two massively parallel processors. DOE

ELECTRON-ELECTRON INTERACTIONS IN FAST NEUTRAL-NEUTRAL COLLISIONS
R. D. DuBois and S. T. Manson (Georgia State Univ., Atlanta.) Nov. 1992 11 p Presented at the 12th International Conference on the Application of Accelerators in Research and Industry, Denton, TX, 2-5 Nov. 1992
(Contract DE-AC06-76RL-01830)
(DE93-004841; PNL-SA-21188; CONF-921116-20) Avail: CASI HC A03/MF A01

Differential electron emission is studied for 50-500 keV H(+) and H atom impact on helium. Using the first Born formulation, it is shown that projectile electron-target electron interactions are expected to dominate the differential cross sections for low energy target electron emission induced by fast neutral projectile impact on any target. Measurements of the 15 degrees electron emission were made in order to investigate this prediction. For low impact energies, a constant ratio between the hydrogen atom and proton impact cross sections was found for emitted electron velocities less than half the projectile velocity, V(sub p). But as the collision energy increased, for electron velocities less than 0.25 V(sub p), the cross section ratio increased as the emitted electron velocity decreased. This is interpreted as a signature of projectile electron-target electron interactions becoming dominant for distant collisions between neutral particles. DOE

RIGOROUS QCD PREDICTIONS FOR DECAYS OF P-WAVE QUARKONIA
G. T. Bodwin, E. Braaten (Northwestern Univ., Evanston, IL.), and G. P. Lepage (Cornell Univ., Ithaca, NY.) Nov. 1992 4 p Presented at the Meeting of the Division of Particles and Fields of the American Physics Society, Batavia, IL, 10-14 Nov. 1992
(Contracts W-31-109-eng-38; DE-FG02-91ER-40684)
(DE93-004853; ANL-HEP-CP-92-109; CONF-921122-8) Avail: CASI HC A01/MF A01

We present a new factorization theorem for the decay rates of P-wave states of heavy quarkonia. Infrared logarithms that had appeared in previous perturbative calculations of P-wave decays are absorbed into a quantity that is related to the amplitude for the heavy quark and antiquark to be in a relative color-octet S-wave state. We predict all of the light-hadronic and electromagnetic decay rates of the chi(sub c) and h(sub c) states in terms of two phenomenological parameters. DOE

PHYSICS FROM PHOTON AND LEPTON-PAIR SPECTRA
G. R. Young Oct. 1992 39 p Presented at the NATO Advanced Study Inst. on Particle Production in Highly Excited Matter, Cioco, Italy, 12-25 Jul. 1992
(Contract DE-AC05-84OR-21400)
(DE93-003083; CONF-920777-2) Avail: CASI HC A03/MF A01

A discussion is given of lepton-pair and direct photon spectra observed in hadron-hadron reactions at center-of-mass energies of 5-10 GeV and higher. Examples are taken from the high-energy p - A literature. The usefulness of lepton-pairs and photons for probing the space-time development of heavy-ion reactions is noted. A brief review of such measurements as they exist presently for heavy-ion reactions is also given, together with some notes for the interested experimentalist. DOE

HIGH RESOLUTION STUDIES OF ATOMS AND SMALL MOLECULES
B. A. Bushaw, R. G. Tonkyn, and R. J. Miller Oct. 1992 5 p Presented at the Advanced Laser Technology for Chemical Measurements, Santa Fe, NM, 19-21 Oct. 1992
(Contract DE-AC06-76RL-01830)
(DE93-004340; PNL-SA-21405; CONF-9210261-1) Avail: CASI HC A01/MF A01

High resolution, continuous wave lasers were utilized successfully in studies of small molecules. Examples of two-photon excitation schemes and of multiple resonance excitation sequences are discussed within the framework of the spectroscopy and dynamics of selected Rydberg states of nitric oxide. Initial results on the circular dichroism of angular distributions in photoelectron spectra of individual hyperfine states of cesium are also discussed, but no data given. DOE

ESTAR, PSTAR, AND ASTAR: COMPUTER PROGRAMS FOR CALCULATING STOPPING-POWER AND RANGE TABLES FOR ELECTRONS, PROTONS, AND HELIUM IONS
M. J. Berger Dec. 1992 31 p Sponsored by DOE
(PB93-146033; NISTIR-4999) Avail: CASI HC A03/MF A01

This report describes three computer codes, ESTAR, PSTAR and ASTAR, which calculate stopping-power and range tables for electrons, protons, or helium ions, according to methods described in ICRU Reports 37 and 49. The codes provide output for electrons in any stopping material, and for protons and helium ions in 74 materials. Executable programs are provided which can be run on IBM-compatible personal computers. FORTRAN source code is also provided for implementing the codes on other computers.

H(-) BEAM NEUTRALIZATION MEASUREMENTS IN A SOLENOIDAL BEAM TRANSPORT SYSTEM
J. Sherman, E. Pitcher, R. Stevens, and P. Allison 1992 8 p Presented at the Production and Neutralization of Negative Ions and Beams, Upton, NY, 9-13 Nov. 1992
(Contract W-7405-eng-36)
(DE93-005460; LA-UR-92-4366; CONF-921145-3) Avail: CASI HC A02/MF A01

H(-) beam space-charge neutralization is measured for 65-mA, 35-keV beams extracted from a circular-aperture Penning surface-plasma source, the small-angle source. The H(-) beam is transported to a RFQ matchpoint by a two-solenoid magnet system. Beam noise is typically +/- 4 percent. A four-grid analyzer is located in a magnetic-field-free region between the two solenoid magnets. H(-) potentials are deduced from kinetic energy measurements of particles (electrons and positive ions) ejected radially from the beam channel by using a griddled energy analyzer. Background neutral gas density is increased by the introduction of additional Xe and Ar gases, enabling the H(-) beam to become overneutralized. DOE

A MASSIVE NEUTRINO IN NUCLEAR BETA DECAY?
E. B. Norman, Yuen-Dat Chan, A. Garcia, K. T. Lesko, R. M. Larimer, Robert G. Stokstad, Igor Zlimen, M. T. F. daCruz, Bhaskar Sur, and M. M. Hindi Sep. 1992 10 p Presented at the International Symposium on Weak and Electromagnetic Interactions in Nuclei, Dubna, Russian Federation, 16-22 Jun. 1992
(Contracts DE-AC03-76SF-00098; DE-FG05-87ER-40314)
(DE93-004706; LBL-32913; CONF-920682-3) Avail: CASI HC A02/MF A01

We have continued our studies of the beta-spectrum of C-14 using a germanium detector doped with C-14. There is a feature in the beta-spectrum 17 keV below the endpoint which could be explained by the hypothesis that there is a heavy neutrino emitted in the beta-decay of C-14 with a mass of 17 +/- 1 keV and an emission probability of 1.26 +/- 0.25 percent. However, we also have performed a high statistics measurement of the inner bremsstrahlung spectrum of Fe-55 and find no indication of the emission of a (sup 17)-keV neutrino. We conclude that the origin of the 'kink' that has been observed in some recent beta spectral measurements is not a neutrino. DOE

SPECTROSCOPY OF HIGHLY-IONIZED ATOMS USING POSITION-SENSITIVE DETECTION
K. W. Kukla, A. E. Livingston, F. G. Serpa, A. S. Zacarias, H. G. Berry, R. W. Dunford, E. Kanter, S. Cheng, and J. Suleiman 1992 3 p Presented at the 6th International Conference on Physics of Highly Charged Ions, Manhattan, KS, 28 Sep. - 2 Oct. 1992
(Contracts W-31-109-eng-38; DE-FG02-92ER-14283; DE-FG05-88ER-13958)
(DE93-002914; ANL/PHY/CP-77423; CONF-920948-6) Avail: CASI HC A01/MF A01

New results of atomic structure and atomic lifetime measurements in highly-ionized few-electron atoms obtained using position-sensitive detection of extreme ultraviolet emission from excited fast ions are reported. Data are presented from experiments run at the Notre Dame Tandem Accelerator and at the Argonne ATLAS facility using beam foil spectroscopy with a photon-counting position-sensitive imaging detector. The results include excited state lifetimes in Si XI and Si XII involving both resonance transitions and Rydberg transitions, spectra of highly-ionized He-like, Li-like, and Be-like nickel including comparisons of electron capture and excitation processes for charge selected beams, and spectra and lifetimes in highly-charged bromine ions for both allowed and forbidden transitions. DOE

PHYSICS STUDIES WITH ICARUS AND A HYBRID IONIZATION AND SCINTILLATION FIBER DETECTOR
D. B. Cline 1992 23 p Presented at the International Conference on Liquid Radiation Detectors: Their Fundamental Properties and Applications, Tokyo, Japan, 7-10 Apr. 1992
(Contract DE-FG03-91ER-40662)
(DE93-003034; CONF-920480-2) Avail: CASI HC A03/MF A01

We discuss the physics possibilities for the ICARUS detector currently being tested at CERN. The physics potential goes from a massive proton decay detector to the study of solar neutrinos. In addition, the detection of nu(sub mu) yields nu(sub tau) and nu(sub e) yields nu(sub tau) will be possible with such a detector. One major topic involves the possibility of a complete determination of the MSW solar neutrino parameters with the ICARUS. The possibility of detecting WIMPS with a scintillating fiber liquid Argon (Ar) detector or fiber Xenon (Xe) detector doped with Ar is also described. Some comments on the measurement of the Ar-42 level from an experiment at the Gran Sasso will be made. DOE

N93-22992# California Univ., Los Angeles.
PARTICLE PHYSICS
B. M. K. Nefkens Nov. 1992 5 p
(Contract DE-FG03-88ER-40420)
(DE93-006894; DOE/ER-40420/T4) Avail: CASI HC A01/MF A01

Research in basic particle and nuclear physics by the UCLA Particle Physics Research Group is reported in the following areas: rare decays of (eta) and (mu) to test charge conjugation invariance, QCD, and the Standard Model; tests of charge symmetry and isospin invariance; studies of baryon resonances: (pi)N scattering, inverse pion photoproduction, eta-meson photoproduction, and the production of the eta meson in pi(-)p decays to eta(n); and exploratory investigations in support of new programs (feasibility study of tagged eta meson production in p(+) H-3 decays to He-4(+)(eta), the alternative eta production reaction (pi)(+) decays to p(+)p(+)eta, particle physics with PILAC, quark physics at a phi-meson factory). ULTRASENSITIVE DETECTION OF SINGLE MOLECULES IN FLOWING SAMPLE STREAMS BY LASER-INDUCED FLUORESCENCE
P. M. Goodwin, C. W. Wilkerson, Jr., W. P. Ambrose, and R. A. Keller 1992 12 p Presented at the International Society for Optical Engineering Conference, Los Angeles, CA, 18-22 Jan. 1993
(Contract W-7405-eng-36)
(DE93-005457; LA-UR-92-4408; CONF-930159-1) Avail: CASI HC A03/MF A01

We report on the detection and fluorescence lifetime measurement of single Rhodamine-110 molecules in a flowing, aqueous sample stream. Time-Correlated Photon Counting (TCPC) used in combination with pulsed excitation allows for the detection, in the presence of significant prompt Raman and Rayleigh background, of photon bursts due to single fluorescent molecules passing through a small detection volume (approximately 1 pL). The fluorescence lifetime of a detected molecule is estimated from the decay curve compiled from photon arrival times in the burst. DOE

THEORY OF THE DISSOCIATION DYNAMICS OF SMALL MOLECULES ON METAL SURFACES: FINITE TEMPERATURE STUDIES
B. E. Jackson Nov. 1992 7 p
(Contract DE-FG02-87ER-13744)
(DE93-005870; DOE/ER-13744/13) Avail: CASI HC A02/MF A01

The goal is to gain a better understanding of metal-catalyzed reactions by examining in detail the dynamics of molecule-metal interactions. Much effort has been focused on treating the molecule quantum mechanically when necessary, and including the effects of finite surface temperature. Recently developed time-dependent quantum techniques have been used to compute the dissociative sticking probability of H2, HD, and D2 on Cu and Ni surfaces. All molecular degrees of freedom can now be included either quantum mechanically or classically. The dependence upon translational and internal molecular energy, the angle and site of surface impact, and the details of the molecule-metal interaction potential were examined. Similar techniques were used to study the Eley-Rideal mechanism for the recombinative desorption of adsorbed H and D atoms with gas-phase H and D atoms. Several useful methods for coupling gas particles to the thermal vibrations of the solid were developed and used in studies of energy transfer and sticking. The trapping of H2 and other diatomics in weakly bound molecular precursors to dissociative adsorption is also of interest. DOE

EXPERIMENTAL STUDIES OF PION-NUCLEUS INTERACTIONS AT INTERMEDIATE ENERGIES
31 Dec. 1992 40 p
(Contract DE-FG04-88ER-40403)
(DE93-005872; DOE/ER-40403/T4) Avail: CASI HC A03/MF A01

This report summarizes investigations of various pion-nucleus interactions and nucleon-nucleus charge-exchange reactions. The work was carried out with the LAMPF accelerator at the Los Alamos National Laboratory and the cyclotrons at the Paul Scherrer Institute (PSI) near Zurich, Switzerland, and at Indiana University (IUCF), as a collaborative effort among several laboratories and universities. The experimental activity at LAMPF involved measurements of new data on pion double-charge-exchange scattering, some initial work on a new Neutral Meson Spectrometer system, a search for deeply-bound pionic atoms, measurements of elastic scattering, and studies of the (n,p) reaction on various nuclei. At PSI measurements of pion quasielastic scattering were carried out, with detection of the recoil proton. Work on the analysis of data from a previous experiment at PSI on pion absorption in nuclei was continued. This experiment involved using a detector system that covered nearly the full solid angle. DOE

COMPUTER SIMULATION OF ATOMIC COLLISION PROCESSES IN SOLIDS
M. T. Robinson Nov. 1992 14 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-005106; CONF-921101-15) Avail: CASI HC A03/MF A01

Computer simulation is a major tool for studying the interactions of swift ions with solids which underlie processes such as particle backscattering, ion implantation, radiation damage, and sputtering. Numerical models are classed as molecular dynamics or binary collision models, along with some intermediate types. Binary collision models are divided into those for crystalline targets and those for structureless ones. The foundations of such models are reviewed, including interatomic potentials, electron excitations, and relationships among the various types of codes. Some topics of current interest are summarized. DOE

HIGH SENSITIVITY TESTS OF THE STANDARD MODEL FOR *ELECTROWEAK INTERACTIONS Progress Report*
D. D. Koetke, R. W. Manweiler, and T. D. ShirvelStanislaus 1993 7 p
(Contract DE-FG02-88ER-40416)
(DE93-006186; DOE/ER-40416/5) Avail: CASI HC A02/MF A01

The work done on this project was focused on two LAMPF experiments. The MEGA experiment, a high-sensitivity search for the lepton-family-number-violating decay mu yields e(gamma) to a sensitivity which, measured in terms of the branching ratio, BR = (mu yields e(gamma))/(mu yields e v(sub mu) v(sub e)) approximately 10(sup -13), is over two orders of magnitude better than previously reported values. The second is a precision measurement of the Michel rho parameter from the positron energy spectrum of mu yields e v(sub mu) v(sub e) to test the V-A theory of weak interactions. The uncertainty in the measurement of the Michel rho parameter is expected to be a factor of three lower than the present reported value. DOE

N93-23977# Brookhaven National Lab., Upton, NY.
GALLEX: FIRST RESULTS AND IMPLICATIONS FOR NEUTRINO PHYSICS
F. X. Hartman 1992 16 p Presented at the Stanford Linear Accelerator Center (SLAC) Summer Institute on Particle Accelerators: Third Family and the Physics of Flavor, Stanford, CA, 13-24 Jul. 1992
(Contract DE-AC02-76CH-00016)
(DE93-004908; BNL-48251; CONF-9207140-3) Avail: CASI HC A03/MF A01

The GALLEX experiment, located in the Gran Sasso underground laboratory, completed its first measurements of the production rate of Ge-71 from Ga-71 due to solar neutrinos. The GALLEX detector is uniquely sensitive to the low energy neutrinos produced by proton-proton fusion in the center of the Sun. From these first measurements, which cover a period of exposure of 295 days, a rate of 83 plus/minus 19 (stat.) plus/minus 8 (syst.) (1 sigma) SNU (1 x 10'(-36)) captures/target atom - second) is reported. This initial result is two standard deviations below the solar model calculations. The implications of a neutrino deficit in terms of neutrino flavor oscillations is summarized. DOE

OVERVIEW OF SPIN PHYSICS
A. Yokosawa 23 Dec. 1992 36 p Presented at the 1992 Artificial Neural Networks in Engineering Conference, St. Louis, MO, 15-18 Nov. 1992
(Contract W-31-109-eng-38)
(DE93-006412; ANL-HEP-CP-93-01; CONF-921185-1) Avail: CASI HC A03/MF A01

Spin physics activities at medium and high energies became significantly active when polarized targets and polarized beams became accessible for hadron-hadron scattering experiments. My overview of spin physics will be inclined to the study of strong interaction using facilities at Argonne ZGS, Brookhaven AGS (including RHIC), CERN, Fermilab, LAMPF, an SATURNE. In 1960 accelerator physicists had already been convinced that the ZGS could be unique in accelerating a polarized beam; polarized beams were being accelerated through linear accelerators elsewhere at that time. However, there was much concern about going ahead with the construction of a polarized beam because (1) the source intensity was not high enough to accelerate in the accelerator, (2) the use of the accelerator would be limited to only polarized-beam physics, that is, proton-proton interaction, and (3) p-p elastic scattering was not the most popular topic in high-energy physics. In fact, within spin physics, (pi)-nucleon physics looked attractive, since the determination of spin and parity of possible (pi)p resonances attracted much attention. To proceed we needed more data beside total cross sections and elastic differential cross sections; measurements of polarization and other parameters were urgently needed. Polarization measurements had traditionally been performed by analyzing the spin of recoil protons. The drawbacks of this technique are: (1) it involves double scattering, resulting in poor accuracy of the data, and (2) a carbon analyzer can only be used for a limited region of energy. DOE

***THE LIQUID CRYSTAL POLARIMETER FOR SOLID-STATE IMAGING* OF SOLAR VECTOR MAGNETIC FIELDS Final Report, 1 Oct. 1988 - 30 Sep. 1992**
Laurence J. November and Lawrence M. Wilkins 28 Sep. 1992 20 p
(AD-A260029; PL-TR-92-2246; AD-E201359) Avail: CASI HC A03/MF A01

The Liquid Crystal Polarimeter (LCP) is a low-voltage complete Stokes polarimeter and spectral analyzer designed for measuring solar vector magnetic fields. The polarimeter consists of polarization and spectral analyzer sections each containing multiple commercially available nematic and ferro-electric liquid crystals that are modulated in phase at up to 31.5 kHz frequency. Used in conjunction with a Lyot birefringent filter and 2 CCD's, the system provides a complete polarization/spectral measurement for solid-state direct imaging of the vector magnetic flux, Doppler velocity, intensity, and line width in a spectral line. Simultaneous 2 CCD imaging gives reduced atmospheric seeing systematics, and automatic CCD gain and dark-current correction. The liquid-crystal design provides a considerable simplification to previous designs with greatly improved speed, sensitivity, reliability, and accuracy. The system is used with a universally tunable Lyot filter (of conventional rotating-element design) to provide sequential observations in a number of solar lines to permit calibration of field strength and measurements as a function of height in the solar atmosphere. An example vector magnetogram is shown as a proof of concept. GRA

A SIMPLE MODEL FOR THE DIELECTRIC BEHAVIOUR OF POLAR SOLVENTS IN THE MEAN SPHERICAL APPROXIMATION
Lesser Blum and W. R. Fawcett 15 Jan. 1993 17 p Prepared in cooperation with California Univ., Davis
(Contract N00014-90-J-1263)
(AD-A260283; TR-26) Avail: CASI HC A03/MF A01

A simple model based on the mean spherical approximation is described for the dielectric properties of polar solvents. The molecular properties required are the dipole moment, the molecular polarizability, and the molecular diameter. It is shown that inclusion of a stickiness parameter accounting for other electrostatic features and non-sphericity in the real system leads to a simple analytical result from which the dielectric constant may be calculated. The stickiness parameter is shown to be correlated to the magnitude of dipole-dipole interactions in the system. GRA

ATOM WAVE INTERFEROMETER Annual Report, 1 Dec. 1991 - 30 Nov. 1992
David E. Pritchard 21 Jan. 1993 4 p
(Contract N00014-89-J-1207)
(AD-A260082) Avail: CASI HC A01/MF A01

Between December 1992 and November 30, 1992, we refined our atom interferometer and started to perform experiments with spatially separated beams. The interferometer is now operating with smaller period gratings, providing greater beam separation. The experiments were performed with the aid of an interaction region that inserts a thin metal foil between the beams. This allowed us to manipulate the atomic wave function in only one arm of the interferometer. The key component of our interferometer is the set of three matched transmission diffraction gratings which we constructed at the National Nanofabrication Facility (NNF) at Cornell University. The process allows fabrication of precisely positioned openings in thin silicon nitride membranes mounted in silicon frames. The pattern created in the membrane is determined by an electron beam writer, making the process quite versatile. GRA

INVESTIGATIONS IN DYNAMICS OF GAUGE THEORIES IN THEORETICAL PARTICLE PHYSICS
1993 26 p
(Contract DE-FG05-92ER-40709)
(DE93-007260; DOE/ER-40709/1-Task-A) Avail: CASI HC A03/MF A01

The major theme of the theoretical physics research conducted under DOE support over the past several years has been within the rubric of the standard model, and concerned the interplay between symmetries and dynamics. The research was thus carried out mostly in the context of gauge field theories, and usually in the presence of chiral fermions. Dynamical symmetry breaking was examined both from the point of view of perturbation theory, as well as from non-perturbative techniques associated with certain characteristic features of specific theories. Among the topics of research were: the implications of abelian and non-abelian anomalies on the spectrum and possible dynamical symmetry breaking in any theory, topological and conformal properties of quantum fields in two and higher dimensions, the breaking of global chiral symmetries by vector-like gauge theories such as QCD, the phenomenological implications of a strongly interacting Higgs sector in the standard model, and the application of soliton ideas to the physics to be explored at the SSC. NEUTRON CROSS SECTION STANDARDS AND INSTRUMENTATION
1 Sep. 1992 18 p
(Contract DE-AI05-91ER-40610)
(DE93-007675; DOE/ER-40610/T1) Avail: CASI HC A03/MF A01

This report from the National Institute of Standards and Technology contains a summary of the accomplishments of the Neutron Cross Section Standards and Instrumentation Project during the second year of a three-year interagency agreement. This program includes a broad range of data measurements and evaluations. An emphasis has been focused on the (sup 10)B cross sections where serious discrepancies in the nuclear data base remain. In particular, there are important problems with the interpretation of the helium gas production associated with diagnostic measurements of interest in nuclear technology. The enhanced use of this isotope for medical treatment is also of significance. New measurements of neutron reaction cross sections for (sup 10)B are in progress in collaboration with scientists at the Oak Ridge National Laboratory. New experiments are in progress on the important dosimetry standards (sup 237)Np(n,f) and (sup 239)Pu(n,f) below 1 MeV neutron energy. In addition, new measurements of charged-particle production in basic biological elements for medical applications are underway. Further measurements are planned or in progress in collaborations which include fission fragment energy and angular distributions, and neutron energy spectra and angular distributions from neutron-induced fission. Also measurements of angular distributions of neutrons from scattering on protons, and determinations of capture cross section of gold are planned for a later time. Data evaluation will shift to include a unified international effort to motivate new measurements and evaluations. In response to the requests of the measurement community, NIST is beginning the formation of a national depository for fissionable isotope mass standards. This action will preserve for future measurements the valuable and irreplaceable critical samples whose masses and composition have been carefully determined and documented over the past 30 years of the nuclear program. DOE

LOW TEMPERATURE TRANSPORT THROUGH A QUANTUM DOT: THE ANDERSON MODEL OUT OF EQUILIBRIUM Technical Report, 1 Jan. - 31 Dec. 1992
Y. Meir, N. Wingreen, and P. Lee Mar. 1993 21 p
(Contract N00014-89-J-1530)
(AD-A260184; TR-42) Avail: CASI HC A03/MF A01

The infinite-U Anderson model is applied to non-equilibrium transport through a quantum dot containing two spin levels weakly coupled to two leads. At low temperatures, the Kondo peak in the equilibrium density of states is split upon the application of a voltage bias. The split peaks, one at the chemical potential of each lead, are suppressed by non-equilibrium dissipation. In a magnetic field, the Kondo peaks shift away from the chemical potentials by the Zeeman energy, leading to an observable peak in the differential conductance when the non-equilibrium bias equals the Zeeman energy. The experimental study of electroweak interactions at Virginia Tech is multifaceted and consists of three parts. The first consists of analysis of

the final states of matter produced in electron-positron annihilations at center-of-mass energies (radical)s = 60 GeV at the TRISTAN collider in Japan (AMY). The second is a sensitive search for rare electroweak processes through a study of mu(+) yields e(+) gamma at the LAMPF facility at Los Alamos (MEGA). It also includes a precise measurement of the Michel (rho) parameter (RHO). The third activity is a R & D detector development and is a precursor to anticipated experiments at proposed B(sup o) meson factories in this country and/or abroad. The physics goals are the study of CP violation in the B(sup 0) system and the determination of the values for Kobayashi-Maskawa matrix. DOE

(Contract W-7405-eng-48)
(DE93-007392; UCRL-ID-112186) Avail: CASI HC A03/MF A01

Passage of ions through the interface between a non-reactive film and substrate can dramatically enhance the adhesion of the film to the substrate. When essentially all the energy deposited by the ions at the interface can be accounted for by electronic excitation, the enhancement process has been termed stitching. We have used this phenomenon to enhance the adhesion of 240-nm thick beryllium films to polished, vitreous carbon substrates using 200-keV carbon ions. The adhesion of the as-deposited films was below that necessary to pass the Scotch-tape-test. Carbon ion fluences greater than about 1 x 10(exp 14) C/cm(exp 2) were sufficient to enhance the adhesion enough to ensure passage of the tape test without affecting the optical properties of the films. In addition, the films remained adherent after exposure to a pulse of soft x rays. DOE

THEORETICAL MODELS OF NEUTRON EMISSION IN FISSION
D. G. Madland 1992 10 p Presented at the Symposium on Nuclear Data Evaluation Methodology, Upton, NY, 12-16 Oct. 1992
(Contract W-7405-eng-36)
(DE93-005482; LA-UR-92-4170; CONF-921046-15) Avail: CASI HC A02/MF A01

A brief survey of theoretical representations of two of the observables in neutron emission in fission is given, namely, the prompt fission neutron spectrum N(E) and the average prompt neutron multiplicity (bar v)(sub p). Early representations of the two observables are presented and their deficiencies are discussed. This is followed by summaries and examples of recent theoretical models for the calculation of these quantities. Emphasis is placed upon the predictability and accuracy of the new models. In particular, the dependencies of N(E) and (bar v)(sub p) upon the fissioning nucleus and its excitation energy are treated. Recent work in the calculation of the prompt fission neutron spectrum matrix N(E,E(sub n)), where E(sub n) is the energy of the neutron inducing fission, is then discussed. Concluding remarks address the current status of our ability to calculate these observables with confidence, the direction of future theoretical efforts, and limitations to current and future calculations. Finally, recommendations are presented as to which model should be used currently and which model should be pursued in future efforts. DOE

HIGH ENERGY PHYSICS PROGRAM AT TEXAS A AND M UNIVERSITY
Nov. 1992 183 p
(Contract DE-FG05-91ER-40633)
(DE93-005112; DOE/ER-40633/2) Avail: CASI HC A09/MF A02

The high energy physics program has continued its experimental activities over the past year. In CDF, the Texas A&M group has led an effort to design an upgrade for the silicon vertex detector, and is currently working with the rest of the collaboration on the next major data taking run. In MACRO, work was done on the development of the final version of the wave form digitizing system being implemented for the entire scintillator system. This work is nearing completion, and the system is expected to be up and running on the detector by summer 1993. Work was done within the SDC group to develop gas microstrip chambers for use in precision tracking at the SSC, and in the GEM group, toward the development of a suitable forward calorimeter design. The theoretical high energy physics program has continued the study of a very successful string-derived model that unifies all known interactions: flipped SU(5), which is the leading candidate for a TOE. Work has also continued on some generalizations of the symmetries of string theory, known as W algebras. These are expected to have applications in two-dimensional conformal field theory, two-dimensional extensions of gravity and topological gravity and W-string theory. DOE

OBSERVATION OF A CHARGE LIMIT FOR PHOTOCATHODE ELECTRON GUNS
M. Woods, J. Clendenin, J. Frisch, A. Kulikov, P. Saez, D. Schultz, J. Turner, K. Witte, and M. Zolotorev Dec. 1992 6 p Presented at the Workshop on Polarized Electron Sources and Electron Spin Polarimeters, Nagoya, Japan, 7-14 Nov. 1992
(Contract DE-AC03-76SF-00515)
(DE93-006948; SU-SLAC-PUB-6019; CONF-9211182-2) Avail: CASI HC A02/MF A01

The Photocathode Electron Gun (PEG) at SLAC is required to produce bunch intensities of up to 10(exp 11) electrons within 2 ns (8 Amps). Operation of PEG has demonstrated a 'Charge Limit' phenomenon, whereby the charge that can be extracted from the gun with an intense laser beam saturates at significantly less than 10(exp 11) electrons (the expected 'Space Charge Limited' charge) when the photocathode Quantum Efficiency is low. We report studies of this Charge Limit phenomenon observed with a GaAs photocathode. DOE

A method for visualizing off-surface flows is provided. The method consists of releasing a gas with infrared absorbing and emitting characteristics into a fluid flow and imaging the flow with an infrared imaging system. This method allows for visualization of off-surface fluid flow in-flight. The novelty of this method is found in providing an apparatus for flow visualization which is contained within the aircraft so as not to disrupt the airflow around the aircraft, is effective at various speeds and altitudes, and is longer-lasting than previous methods of flow visualization.

TRANSVERSELY POLARIZED SOURCE CLADDING FOR AN OPTICAL FIBER Patent Application
Claudio O. Egalon, inventor (to NASA) (AS&M, Inc., Hampton, VA.) and Robert S. Rogowski, inventor (to NASA) 25 Feb. 1993 16 p
(NASA-Case-LAR-14652-1-SB; NAS 1.71:LAR-14652-1-SB;
US-Patent-Appl-SN-022582) Avail: CASI HC A03/MF A01

An optical fiber comprising a fiber core having a longitudinal symmetry axis is provided. An active cladding surrounds a portion of the fiber core and comprises light-producing sources which emit light in response to chemical or light excitation. The cladding sources are oriented transversely with respect to the longitudinal axis of the fiber core. This polarization results in a superior power efficiency compared to active cladding sources that are randomly polarized or longitudinally polarized parallel with the longitudinal symmetry axis. THE PNL HIGH-TRANSMISSION THREE-STAGE MASS SPECTROMETER
J. J. Stoffels, D. R. Ells, L. A. Bond, P. A. Freedman, B. N. Tattersall (VG Isotech, Middlewich, England.), and C. R. Lagergren (Westinghouse Hanford Co., Richland, WA.) Dec. 1992 36 p
(Contract DE-AC06-76RL-01830)
(DE93-006143; PNL-8456) Avail: CASI HC A03/MF A01

We have constructed a three-stage isotope-ratio mass spectrometer of unique ion-optical design that achieves high ion transmission efficiency and high abundance sensitivity. The spectrometer has tandem 90 deg deflection magnets with boundaries 18 deg off normal. The magnet drift lengths are 1.48 times the 27-cm radius of deflection. This extended geometry gives a mass dispersion equivalent to a 40-cm-radius magnet with normal boundaries. The first magnet renders the ion beam parallel in the vertical plane and provides a focus in the horizontal plane of mass dispersion. The second magnet brings the beam to a stigmatic focus. This novel ion-optical design gives 100 percent transmission without the need for intermediate focusing lenses. It also provides a 16 percent increase in mass resolution over the traditional tandem geometry with normal magnet boundaries. Complete transmission of ions is maintained through a third-stage cylindrical electric sector of 38-cm radius, which provides increased isotope-abundance sensitivity. The isotope-abundance sensitivity of the new mass spectrometer is an order of magnitude better than similar instruments with normal magnet boundaries. This is because the vertical focusing of the ion beam prevents ion scattering from the top and bottom of the flight tube. The measured values of the isotope-abundance sensitivity one-half mass unit away from the rhenium ion peaks at masses 185 and 187 are M - 1/2 = (6.5 +/- 0.5)(10)(exp -10) and M + 1/2 = (3.1 +/- 0.8)(10)(exp -10). By extrapolation, the uranium isotope-abundance sensitivity is M - 1 = 1(10)(exp -10). Construction of the instrument was facilitated by using standard commercial mass spectrometer components. DOE

(DE93-005761; CONF-9210232-5) Avail: CASI HC A01/MF A01

ORNL is developing a new group of fiber-optic sensors for characterizing physical aspects such as ambient temperature. These sensors exploit the inherent property of thermographic materials that the lifetime and/or intensity of the emitted fluorescence decreases with increasing temperature. Unlike current fluorescent temperature sensors that use a light source for excitation, these sensors are totally passive (self-powered) and use either an embedded or external radiation source. A proof-of-principle temperature sensor was developed, based on this concept, using a well-known thermographic material, magnesium fluorogermanate. Experimental results showed that the radiation-induced fluorescence resulted in an intensity change but no significant decay rate change with increasing temperature. DOE

THE EFFECT OF UV LIGHT ON Ir ABSORPTION IN CHEMICALLY VAPOR DEPOSITED a-SIN(x):H FILMS
C. H. Seager and J. Kanicki (International Business Machines Corp., Yorktown Heights, NY.) 1992 5 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC04-76DP-00789)
(DE93-004502; SAND-92-1520C; CONF-921101-18) Avail: CASI HC A01/MF A01

The optical absorption properties of Plasma Enhanced Chemically Vapor Deposited (PECVD) films of hydrogenated amorphous silicon nitride (a-SiN(x):H) over the energy range from 0.54 to 2 eV using Photothermal Deflection Spectroscopy (PDS) were measured. The near-infrared absorption properties of these films measure the H bonded to Si or N as well as density of electronic gap states due to species like Si dangling bonds. Typical PDS spectra obtained on as-deposited films show a broad absorption tail with a large number of narrow absorption peaks. Nitride-related absorption was separated from that arising from the fused quartz substrates. In addition to the broad, featureless band tail, whose magnitude is quite sensitive to optical excitation with light above approximately 3.9 eV, a number of narrow absorption peaks are observed which are identified as overtones of localized vibrational modes. Specifically, peaks at 0.82 and 1.20 eVare seen which are identified as the first and second harmonics of N-H stretching vibrations, and several other peaks whose origins remain undetermined. Prolonged UV excitation produces no detectable change in these vibrational modes, although large changes are seen in the underlying absorption tail. This reinforces previous suggestions that photoinduced changes in these films do not arise from rearrangement of the bonded hydrogen. DOE

LUTE PRIMARY MIRROR MATERIALS AND DESIGN STUDY REPORT
Greg Ruthven Feb. 1993 100 p
(NASA Order H-11994-D)
(NASA-CR-192487; NAS 1.26:192487; PR-D15-0013A) Avail: CASI HC A05/MF A02

The major objective of the Lunar Ultraviolet Telescope Experiment (LUTE) Primary Mirror Materials and Design Study is to investigate the feasibility of the LUTE telescope primary mirror. A systematic approach to accomplish this key goal was taken by first understanding the optical, thermal, and structural requirements and then deriving the critical primary mirror-level requirements for ground testing, launch, and lunar operations. After summarizing the results in those requirements which drove the selection of material and the design for the primary mirror are discussed. Most important of these are the optical design which was assumed to be the MSFC baseline (i.e. 3 mirror optical system), telescope wavefront error (WFE) allocations, the telescope weight budget, and the LUTE operational temperature ranges. Mechanical load levels, reflectance and microroughness issues, and options for the LUTE metering structure were discussed and an outline for the LUTE telescope sub-system design specification was initiated. The primary mirror analysis and results are presented. The six material substrate candidates are discussed and four distinct mirror geometries which are considered are shown. With these materials and configurations together with varying the location of the mirror support points, a total of 42 possible primary mirror designs resulted. The polishability of each substrate candidate was investigated and a usage history of 0.5 meter and larger precision cryogenic mirrors (the operational low end LUTE temperature of 60 K is the reason we feel a survey of cryogenic mirrors is appropriate) that were flown or tested are presented. Derived from text

A VECTOR SIGNAL PROCESSING APPROACH TO COLOR M.S. Thesis
Kah-Kay Sung Jan. 1992 146 p
(Contracts N00014-89-J-3139; N00014-91-J-4038; NSF MIP-88-14612)
(AD-A259499; AI-M-1349) Avail: CASI HC A07/MF A02

Color is a useful visual cue for obtaining surface material information in a scene. Unfortunately, the surface color of an object can sometimes be different from its recorded color in an image because of optical effects like highlight and inter-body reflection. These effects often confuse traditional color algorithms that assume all surfaces in a scene to be perfectly lambertian. This thesis adopts a signal processing approach to color vision. It represents surface color as a vector signal in a 3-dimensional color space, from which we extract region and boundary information. We immediately face two problems with this approach. The first, which is the same problem that traditional color algorithms face, is that highlight and inter-body reflection effects make image color different from surface color. We use a simple but effective method based on the theory of polarizing filters and electromagnetic wave reflection to correct for these effects on dielectric material surfaces in the scene. The second problem is to augment traditional scalar signal processing tools for 3-dimensional color vector signals. We linearize color by defining a notion of color similarity and difference, and use these measures in place of their traditional scalar counterparts in our vector signal processing algorithms. The main contribution of this thesis is the systematic approach we propose that allows us to extend scalar signal processing tools and concepts into a multi-dimensional vector domain. We also discuss some ways of integrating surface color information with grey level intensity information. GRA

OPTIMAL THREE-DIMENSIONAL MATCHED FILTER PROCESSING FOR DETECTION OF POINT-LIKE MOVING OBJECTS IN CLUTTER
John N. Sanders 30 Sep. 1992 59 p
(Contract F19628-90-C-0002)
(AD-A259727; TR-946; ESD-TR-91-244) Avail: CASI HC A04/MF A01

A simple model of a time sequence of star images containing a moving point object (satellite) is developed. Optimal signal enhancement and detection processing theory is applied to this model and a three-dimensional Fourier matched filter implementation is derived to compute clutter-to-noise ratio (CNR) suppression, signal-to-noise ratio (SNR) enhancement, and probability of detection (Pd) and false alarm (Pfa) rate estimates as a function of input single pixel SNR. Using this theory allows one to compute the Fourier domain matched filters directly, thereby eliminating the enormous storage cost associated with large banks of three-dimensional matched filters. The model and theory are tested using computer-generated simulated data sets having known noise and clutter characteristics. The theory is then applied to real data sets collected using a Lincoln Laboratory CCD camera. Initial results indicate good agreement with matched filter theory. Detection of objects with an initial single pixel SNR approximately equal to 1 is demonstrated. GRA

N93-23499 Open Univ., Oxford (England).
SPHERICAL WAVE REFLECTION AND TRANSMISSION Ph.D. Thesis
Yu Chen 1992 208 p
Avail: Univ. Microfilms Order No. BRDX97161

This study is concerned with the reflection and transmission of spherical waves at a plane interface between two different media. The phenomenon of the reflection and transmission of spherical waves have been studied by means of analytical methods, numerical computation, and experimental tests. A new integral representation for a spherical wave is obtained by transforming Lamb/Sommerfeld's integral representation. The new integral has no singularity so it allows more accurate numerical integration. A new proof of Lamb/Sommerfeld's integral representation for a spherical wave is presented based on the new integral. By using the new form of solutions for reflected waves and existing solutions for transmitted waves, numerical studies have been carried out to examine the phenomenon of reflection and transmission of spherical waves at plane surfaces of discontinuity in material properties. It is shown that the effective critical angle for the total reflection of a spherical wave is greater than that of a plane wave at a hard boundary, and that when the source height increases the effective critical angle for the total reflection of a spherical wave tends to that of a plane wave. It is shown that recent predictions of spherical wave reflection and transmission coefficients greater than 1 at normal incidence under certain conditions are probably due to numerical integration error. It also has been found that for spherical wave reflection and transmission, the time average energy flux, normal to a plane parallel to the plane of discontinuity, may locally be in the direction opposite to that of the direction of energy transmission over the plane as a whole. This so-called 'backward wave' occurs in an interference between the direct and reflected waves, as well as in a transmitted wave. An indirect test on the theory has been performed to check the pressure field, above a rigid boundary, predicted by the spherical wave theory. Theoretical and experimental results were in good agreement. Dissert. Abstr.

ACTIVE MICROPARTICLE MEDIA Final Report, 25 Sep. 1987 - 13 Jan. 1991
T. P. Shen Sep. 1992 152 p
(Contract F29601-87-C-0050)
(AD-A259722; AD-E201268; PL-TR-91-1020) Avail: CASI HC A08/MF A02

The theoretical and experimental research on the active nonlinear optical processes in the microparticle composites and conjugated polymers were investigated. The experimental studies focused on the transient effects in the phase conjugation and coherent beam combination using picosecond pulses. The theoretical studies emphasized the physical mechanisms of the nonlinear properties of the metallic microparticle composites and the conjugated polymers. Solid-state nonlocal continuum for the nonlinear electrodynamics of the microparticle composites was developed. A semiclassical lattice-dynamic theory was derived to predict the large nonresonant optical nonlinearity below the bandgap for one-dimensional

conjugated polymers. This effort concentrated on the electronic nonlinearity of the microparticle composites and the conjugated polymers. The electronic nonlinearity is the most significant contribution for the picosecond pulse applications, which are useful in the high bit-rate transmission and communication. GRA

MULTIDIMENSIONAL SIGNAL CODING IN THE VISUAL SYSTEM Annual Report No. 2, 1 Nov. 1991 - 31 Oct. 1992
Gershon Buchsbaum 23 Nov. 1992 8 p
(Grant AF-AFOSR-0082-91)
(AD-A259836; AFOSR-92-1004TR) Avail: CASI HC A02/MF A01

The aims of this research are (1) To study the multidimensional spatio-temporo-chromatic signal processing capabilities of visual receptive fields. (2) To identify the key attributes of multidimensional image signals which are sensitive to receptive field filters and how these attributes are transformed for encoding beyond the receptive fields. By using digitized sequences of natural images, formulating a representation for natural images, and incorporating properties of specialized visual receptive fields and neural pathways we (1) Propose a model of how the early visual system efficiently codes natural time varying images, first by tracking part of the image, then by matching the spatiotemporal properties of the neural pathway to those of the tracked image. We also propose that retinal architecture which varies with eccentricity also matches the properties of the tracked image. (2) Develop a new model for signal propagation through multiple cell layers in the retina which can incorporate the different cell densities in retinal cell layers. (3) Propose that visual color receptive fields are matched to the spatio-chromatic structure of natural color images. GRA

OPTICAL ANALYSIS OF LENSLET ARRAYS Final Report, 22 Dec. 1988 - 31 Oct. 1991
John P. Kurmer, Wolf P. Altman, John S. Laudo, Daniel R. Grieser, and Jane F. OLoughlin Dec. 1992 85 p
(Contract DAAK60-89-C-0010)
(AD-A260126; NATICK-TR-93/011) Avail: CASI HC A05/MF A01

Designs were developed of arrays of small-diameter (2-4 mm) unity-power telescopes to be used with nonlinear optical materials in the protection of the eyes against tunable lasers. A ray-tracing program (Super-Oslo(TM)) was used to design lenslets and predict the performance of four-lens telescopes (quads). Lens types adjudged most promising were aspheres, curved graded-index (GRIM) and kinoform (diffractive) combined with spherical. Variables included lenslet diameter, f-number, quad length, and optical gain. Packing configurations utilized square, round, and hexagonal quads. Properties evaluated included resolution, field of view, aberrations, tolerances, and overall usefulness as components in compact, lightweight goggle elements. Commercial arrays of lenslets were evaluated and found unacceptable. Bi-aspheric lenslets were designed and injection-molded. Lenses from the first supplier were unacceptable, but high-quality lenses were obtained from a second source. An array of 76 lenslet elements, constructed for evaluation of visual characteristics, showed fair optical quality. GRA

TOWARDS INFRARED IMAGE UNDERSTANDING Ph.D. Thesis
Peter Foulkes 1991 242 p
Avail: Univ. Microfilms Order No. BRD-97292

An extensive literature survey has revealed that the majority of previous work in infrared image processing ha ignored the processes leading to the formation of infrared images. Processing has normally either been restricted to simple low-level image enhancement convolutions or has consisted of algorithms copied from computer vision without regard for the inherent differences between infrared and visible images. In this thesis, we address the problem of infrared image formation and derive an irradiance equation for simple infrared scenes. We consider the complications caused by mutual illumination of one or more bodies and indicate how the infrared irradiance equation can also be specified for more complex scenes. The infrared irradiance equation we derive is solved in closed form for some simple geometries for both Lambertian and non-Lambertian surfaces. An infrared imager has been built and is described. Images taken with the imager of a variety of scene geometries show that the experimental results compare favorably with the theoretically derived equations, indicating the validity of the theoretical analysis. We describe how a knowledge of the formation of infrared images can be used to predict the image irradiance pattern of a particular object. We also show how, with a knowledge of the radiance properties and surface geometry of the object, it is possible to detect instances of that object in a scene. Examples are given of successful object detection based on an understanding of the image irradiance. We present a brief history of infrared imagers and a description of the principles on which modern infrared imagers are based. In addition to the survey of the literature published on infrared image processing, a brief summary of some techniques from the computer vision literature and their suitability to infrared image processing is given. A selection of vision techniques are applied to both infrared and visible images to verify conclusions reached in the thesis. Dissert. Abstr.

APPARENT OPACITY AFFECTS PERCEPTION OF STRUCTURE FROM MOTION
Daniel Kersten and Heirich Buhlthoff Jan. 1992 7 p
(Contracts DACA76-85-C-0010; N00014-85-K-0124)
(AD-A260099; AI-M-1285; CBIP-34) Avail: CASI HC A02/MF A01

It is well known that the human visual system can reconstruct depth from simple random-dot displays given motion information. This fact has lent support to the notion that structure from stereo and motion systems rely on low-level primitives or tokens, such as edges, derived from image intensities. In contrast, the judgment of surface attributes such as transparency or opacity is often considered to be a higher-level visual process that would make use of low-level stereo or motion information, and perhaps attention or later recognition to tease apart the transparent from the opaque parts. This is exemplified by the lack of computational studies dealing with transparency, compared with the at least limited success of a number of algorithms to solve structure from motion or stereo. In this study, we describe a new illusion and some results that question the above view by showing that depth from transparency and opacity can override the rigidity bias in perceiving depth from motion. This provides

support for the idea that the brain's computation of the surface material attribute of transparency may have to be done either before, or in parallel with the computation of structure from motion. GRA

FIBER OPTIC INTERFEROMETER CONFIGURATION WITH PUMP-INDUCED PHASE CARRIER Patent Application
Alan D. Kersey, inventor (to Navy) and Carl A. Villarruel, inventor (to Navy) 1 May 1992 21 p
(AD-D015617; US-Patent-Appl-SN-693496; Navy-Case-74137) Avail: CASI HC A03/MF A01

An interferometric fiber optic sensor and method are provided for controlling the optical phase of a fiber interferometer by an optically induced change in the refractive index for one arm of the fiber interferometer and providing a passive all-optical phase shift interrogation in response to this dependency on the optically induced change in the refractive index. The interferometric fiber optic sensor includes a laser source for generating light at a first predetermined wavelength, a fiber interferometer coupled to the laser source and having first and second fiber arms with a predetermined optical path difference between the fiber arms, a predetermined one of the first and second fiber arms being doped with an element for introducing an optically adjustable absorption spectrum, and a pump laser coupled to the predetermined fiber arm for generating light at a second predetermined wavelength so that an effective index for a guided mode in the predetermined fiber arm and a phase delay of the light passing through the fiber interferometer are changed. As a result, the interferometric fiber optic sensor and method allows the phase interrogation of the fiber interferometer by using a passive all-optical approach based on a pump induced refractive index change in the doped fiber arm so that balanced all fiber interferometer elements are used as sensors for eliminating laser induced phase noise. THE OPTICAL DESIGN OF THE SPECTROCORONAGRAPH: AN ULTRAVIOLET CORONAGRAPH PAYLOAD FOR A SOUNDING ROCKET PLATFORM Ph.D. Thesis
Clarence Marinus Korendyke 1992 206 p
Avail: Univ. Microfilms Order No. DA9234596

The spectrocoronagraph was specifically designed to observe the solar corona utilizing the relatively unexplored near-UV emission lines present above the solar limb. These lines were first observed by the Naval Research Laboratory Skylab spectrograph and are relatively bright with respect to the solar disk. They contain a number of useful plasma temperature and density diagnostics. The instrument allows a large number of high spatial resolution (less than 1 arc-second), narrow band-width (approximately 0.1 A), two dimensional coronal images in these emission lines to be obtained during a single sounding rocket flight. These observations will yield valuable information on the dominant physical processes present in the inner corona. The spectrocoronagraph consists of a low stray light telescope followed by an imaging spectrograph. The telescope and spectrograph designs incorporate new features to enhance their performance. The coronagraph telescope design includes a Lyot stop and an occulter to reduce instrument stray light levels. The nontraditional choice of a mirror objective allows a compact design with superb solar rejection, no chromatic aberration and excellent imaging properties. The focal plane package utilizes a Fabry-Perot (FP) interferometer in series with a grating spectrograph to produce a channelled spectrum consisting of a series of two dimensional, narrow bandwidth images at the instrument focal plane. All significant optical performance issues have been examined and resolved. The optical performance of near-UV FP interferometer coatings was investigated and found to be sufficient for this application. Measurements of visible and near-UV scattered light from two super-polished mirrors were obtained. The visible measurements showed that the near specular scattered light from these mirrors was equivalent to or better than scattered light from coronagraph quality lenses and mirrors described in the literature. The scattered disk radiation originating at the mirror objective was predicted from the near-UV measurements and compared favorably with coronal intensities at the focal plane. Dissert. Abstr.

LOW-DAMAGE MULTILAYER MIRROR FOR THE SOFT X RAY REGION Patent Application
John F. Seely, inventor (to Navy) 30 Sep. 1992 33 p
(AD-D015621; US-Patent-Appl-SN-953697; Navy-Case-73911) Avail: CASI HC A03/MF A01

A mirror for reflecting radiation at a desired wavelength in the soft x-ray region, comprises a substrate and a coating on the substrate. The coating contains a first section and a second section. The first section comprises at least one layer made up of at least a spacer sublayer and a nodal sublayer. The optical thickness of each spacer sublayer is selected so that, upon application of the radiation of desired wavelength, the mirror generates a standing wave having a node in the middle of each nodal sublayer. The second section is disposed between the first section and the substrate, and comprises a plurality of optically absorptive layers. GRA

We have attacked the problem of designing efficient time-frequency computational tools by the following methods: developing selection procedures which shape an analyzing signal from a priori and precomputed front-end computations on input data based on the Zak transform and ambiguity function; and implementing and comparing code for computing Gabor coefficients. This code uses fast FFT algorithms developed under a DARPA contract. We have determined that the algorithm based on a deconvolution formula produces the fastest code and have applied this code using the one-sided exponential window to transient signal detection. Additionally, we developed a new algorithm for computing classical Gabor coefficients based on the concept of a generalized biorthogonal. This algorithm delays the effects of zero theorem and provides for numerically stable computation of Gabor coefficients locally around known Gabor coefficients. Finally, we developed the proper form of finite discrete Gabor transform by periodizing and sampling. We have applied these results to Gabor representational schemes for submicron filtering, image reconstruction, and image transfer for application to submicron lithography and to designing and constructing optical devices to implement time-frequency representations and to carry out processing on such representations including transient signal detection. NONLINEAR OPTICS AND TURBULENCE Final Report, 1 Dec. 1989 - 30 Nov. 1992
Alan C. Newell Oct. 1992 26 p
(Grant AF-AFOSR-0021-90)
(AD-A259950; AFOSR-93-0013TR) Avail: CASI HC A03/MF A01

The ongoing and primary goal of the research is the pursuit of understanding of nonlinear processes in natural phenomena arising in optics and fluids. A considerable share of our attention is devoted to nonlinear optics, a relatively young subject, extremely rich in scientific and technological potential. While the studies focus on scientific questions connected with laser diode arrays, beam instabilities and the behavior of light beams at interfaces between nonlinear dielectrics, the technological ramifications and future opportunities are in many cases obvious. Optics also serves as a useful paradigm for gaining an increased understanding in other fields. For example, turbulence in optics, the study of the complex space-time filaments, patterns and defects which appear in feedback cavities and

counterpropagating beams may be more analytically tractable than in other branches of continuous mechanics. There is little doubt that nonlinear optics is a subject in which interest is increasing. GRA

The main focus of this project was on high-speed fiber-optic local and metropolitan area networks (LAN's/MAN's) which cover larger distances than traditional LAN's, are implemented in fiber, and operated at high data rates (100 Mbps - 1 Gbps range). Considerable progress was made on the investigation of new medium access control techniques which can not only provide good delay and throughput characteristics, but also provide fairness, support scalability, and accommodate integrated services. Research on the next generation of local networks (referred to as local lightwave networks) was also initiated, with the goal being to exploit the huge electro-optic bandwidth mismatch by employing innovative parallelism and concurrency mechanisms, viz. wavelength division multiplexing (WDM). Progress was made on the development of new architectures and protocols suitable for lightwave technology. GRA

Researchers developed techniques required for a more thorough analysis of nonlinear optics in droplets and developed models for some nonlinear processes. Techniques for modeling the resonances of perturbed spheres, based primarily on perturbation methods, were continuing to be developed. Falling droplets deviate from perfect sphericity, and laser beams can induce inhomogeneities in the droplets. The techniques developed for perturbed spheres now allow us to model dispersive and absorptive optical bistability in droplets. Linear time-dependent internal fields in droplets illuminated with laser pulses were modeled as a prelude to analyzing the nonlinear optical effects usually observed with pulsed laser illumination. Techniques for computing the internal and scattered fields of droplets illuminated with Gaussian beams were developed. Since droplets are often illuminated with Gaussian beams which may be focused on or outside the droplets, this capability is needed for a thorough modeling of nonlinear optics in droplets. GRA

DETERMINATION OF THE OPTICAL PROPERTIES OF PARTICLES FOR SOLAR HEATED FLUIDIZED BEDS Ph.D. Thesis - Karlsruhe Univ. [BESTIMMUNG DER OPTISCHEN EIGENSCHAFTEN VON PARTIKELN FUR SOLARBEHEIZTE WIRBELSCHICHTEN]
Christian Sasse May 1992 122 p In GERMAN
(DLR-FB-92-15; ETN-93-93574) Avail: CASI HC A06/MF A02; DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

The optical properties of irregularly shaped particles of size ranges from 10 to 300 micrometers are determined in order to calculate the absorptance of a solar heated fludized bed. An experimental numeric procedure is developed in order to predict the radiative transfer in a fludized bed without prior knowledge of the complex refractive index. The absorptance and scattering in solar heated circulating fluidized beds is calculated with the one dimensional radiative transfer equation, assuming a azimuthal symmetry. The input parameters of the radiative transfer equation are the albedo and the phase function of the single particle. These parameters are determined through two individual measurement techniques in combination with a simplified radiative transfer model, the two flux model. The procedure is used to determine the absorptance of gas particle mixtures, for example air with SiC, C, and oil shale. ESA

THE DETECTION AND AMPLIFICATION PROCESSES IN LOW LIGHT LEVEL CAMERAS WITH CCD AND IMAGE INTENSIFIER
Johannes Soelhusvik 11 Jun. 1992 88 p In NORWEGIAN
(FFI-92/7017; ETN-93-93569) Avail: CASI HC A05/MF A01

The various physical and electronic processes that take place inside a 2nd or 3rd generation Intensified Charge Coupled Device (ICCD) camera were studied mathematically, thus providing a means of simulating the output from the camera. The ICCD camera is used in low light level imaging and is based on combining the high sensitivity of proximity focussed image intensifiers with the versatile CCD sensor for converting the output from the image intensifier into an electronic video signal. Starting with typical scene illumination levels, and the collection of radiation (photons) by the lens, all the detection, amplification, and noise mechanisms that take place inside the image intensifier and the CCD were modeled. SALIENT ISSUES OF EDGE PHYSICS PERTAINING TO LOSS OF CONFINEMENT: A RESISTIVE MHD ANALYSIS
D. R. Thayer 23 Apr. 1992 4 p
(Contract DE-FG03-90ER-54071)
(DE93-006123; DOE/ER-54071/T3) Avail: CASI HC A01/MF A01

Contributions were made towards the ultimate goal of creating a complete theory of edge turbulence and transport in magnetic fusion devices. The main focus was to utilize a resistive magnetohydrodynamic (MHD) model. This analysis includes: (1) 'rippling' type models in which the current fluctuations are decoupled and the resistivity fluctuations are fundamental, and (2) 'drift' type models in which the ambient current can be small (no resistivity fluctuations needed) and the current fluctuations are fundamental. In these turbulence frameworks, the important atomic physics based edge sources were included (impurity radiation, ionization, and charge exchange effects). DOE

THERMALLY DRIVEN TURBULENCE AND TRANSPORT IN A SHEARED SYSTEM
D. R. Thayer and P. H. Diamond (California Univ., San Diego.) 1992
18 p
(Contracts DE-FG03-90ER-54071; DE-FG03-88ER-53275)
(DE93-006125; DOE/ER-54071/T5) Avail: CASI HC A03/MF A01

Results from a theory of radiatively enhanced tokamak edge turbulent transport are presented. A serious restriction on the impurity radiation drive is identified. In particular, due to a lack of pressure balance near a rational surface, the condensation effect does not survive. Consequently, the thermal instability drive is the only impurity radiation instability which remains. Our analysis consists of a theoretical calculation for the thermally driven drift-rippling mode model (phi, eta, Tau, nu(sub parallel)). Calculations of the edge fluctuations and the resultant transport coefficients versus radius are presented. DOE

SIMULATION OF A PARTICLE-LADEN COMBUSTION FLOW IN AN MHD SECOND STAGE COMBUSTOR
S. L. Chang and S. A. Lottes 1992 19 p Presented at the Winter Annual Meeting of the ASME, Anaheim, CA, 8-13 Nov. 1992
(Contract W-31-109-eng-38)
(DE93-004244; ANL/CP-75323; CONF-921110-41) Avail: CASI HC A03/MF A01

An Argonne two-phase combustion flow computer code is used to simulate reacting flows to aid the development of an advanced combustor for magnetohydrodynamic power generation. The combustion code is a general hydrodynamics computer code for two-phase two-dimensional, steady state, turbulent, and reacting flows, based on mass, momentum, and energy conservation laws for multiple gas species. The combustion code includes turbulence, integral combustion, and particle evaporation submodels. The newly developed integral combustion submodel makes calculations more efficient and more stable while still preserving major physical effects of the complex combustion processes. The combustor under investigation is a magnetohydrodynamic second stage combustor in which opposed jets of oxidizer are injected into a confined cross-stream of hot coal gas flow following a first stage swirl combustor. The simulation is intended to enhance the understanding of seed particle evolution in the combustor and evaluate the effects of combustor operation conditions on seed particle evolution and vapor dispersion, which directly affect overall magnetohydrodynamic power generation. Simulation results show that oxidizer jet angle and particle size have great effect on the particle evolution and vapor dispersion. At a jet angle of about 130 deg, the particle evaporation rate is the highest because of the highest average gas temperature. For particles having a smaller mean diameter, particle evaporation is more complete and vapor dispersion is more uniform. DOE

EXPLOSIVE PULSE POWER FOR FUSION APPLICATIONS
R. E. Reinovsky, I. R. Lindemuth, S. P. Marsh, and E. A. Lopez 1992
22 p Presented at the 6th International Conference on Megagauss Magnetic Field Generation and Related Topics, Albuquerque, NM, 9-12 Nov. 1992
(Contract W-7405-eng-36)
(DE93-003828; LA-UR-92-3759; CONF-921133-5) Avail: CASI HC A03/MF A01

Explosive pulse power systems, powered by flux compression generators and including a variety of high current power conditioning components, such as high current opening switches, are attractive for powering fusion physics experiments which require 10's MJ of electrical energy. Such systems are economical when compared to other high energy sources and require little capital investment to enable initial experiments. They are flexible and readily reconfigurable to accommodate changing experimental requirements and can be designed, assembled, and fielded in relatively short periods of time. Several configurations of very high energy flux compressors have been explored at Los Alamos and recently Russian researchers at the All Russian Institute of Experimental Physics (VNIIEF) have reported notable results from modular systems based on disk concepts. A phenomenological model of disk flux compressors is described. The performance predicted by these models is in sufficiently good agreement with the results reported by VNIIEF researchers to allow the model to be applied, in the future, to the design of power conditions systems for use in conjunction with these high performance generators. DOE

SIMPLE OPTICS DESCRIPTION OF THE PLASMA SHEATH AND PLASMA ELECTRODE REGION
C. L. Fink and B. P. Curry 1992 11 p Presented at the Production and Neutralization of Negative Ions and Beams, Upton, NY, 9-13 Nov. 1992
(Contract W-31-109-eng-38)
(DE93-004851; ANL/EP/CP-78014; CONF-921145-2) Avail: CASI HC A03/MF A01

A simple model of the optics of an ion source was developed and compared with the exact Poisson solution calculated by computer code SNOW. The model replaces the Poisson potential by a Laplacian potential that is calculated by replacing the plasma and plasma sheath by a planar plate. This Laplacian potential is then used with and without a linear space-charge correction to calculate particle trajectories. In this model the only free parameter is the distance between the planar plate and the plasma electrode. In general, there is good agreement between emittance curves calculated by the model and the SNOW results even when no space-charge correction is used. This implies for the geometry studied, that the effects of the plasma sheath and non-linear space-charge forces are small compared to aberrations introduced by the plasma aperture. DOE

EXPERIMENTAL STUDIES OF INSTABILITIES IN RADIALLY IMPLODING PLASMAS
H. Oona, R. L. Bowers, D. L. Peterson, C. Findley, J. C. Cohrane, and J. S. Ladish 1992 15 p Presented at the 6th International Conference on Megagauss Magnetic Field Generation and Related Topics, Albuquerque, NM, 9-12 Nov. 1992
(Contract W-7405-eng-36)
(DE93-003831; LA-UR-92-3765; CONF-921133-4) Avail: CASI HC A03/MF A01

In this paper we present experimental data from two experiments that show the initiation and growth of instabilities and compare them to a two dimensional radiational magnetohydrodynamic (RMHD) computation. High-speed cameras (Imacons) were used to observe the implosion as the plasma converges and stagnates on axis. Computer-image enhancement was used to determine the periodicity and amplitude of the initial perturbations. In the two experimental cases, the 5-cm-radius implosion foils had mass of 4.2 and 12.6 milligrams. The data show that the larger mass evolves into a more uniform implosion. Also, we determine the implosion velocity and the growth rate of a selected perturbation. DOE

NONLINEAR INTERACTION OF MAGNETOHYDRODYNAMIC INSTABILITIES IN RADIALLY IMPLODED PLASMAS
R. L. Bowers, J. H. Brownell, A. E. Greene, H. Kruse, H. Oona, and D. L. Peterson 1992 8 p Presented at the 6th International Conference on Megagauss Magnetic Field Generation and Related Topics, Albuquerque, NM, 9-12 Nov. 1992
(Contract W-7405-eng-36)
(DE93-003834; LA-UR-92-3774; CONF-921133-1) Avail: CASI HC A02/MF A01

The magnetic implosion of cylindrical, conducting loads has been used in pulsed power experiments for decades as a source of soft x-rays. In the Los Alamos foil implosion project we have designed and fielded experiments with thin aluminum foils which have been driven in direct drive mode, or which have employed a fast opening switch in the final pulse tailoring stage. In this paper we discuss computational modeling and the results of several experiments in which 4.24 and 12.7 mg aluminum loads were imploded in direct drive mode. In these experiments the load was at an initial radius of 5.0 cm, and the bank delivered about 3 MA to it during the implosion. One-dimensional (1-D) model of these implosions generally predict efficient conversion of magnetic energy into x-ray output and radiation pulsewidths that are very short. DOE

A NONEQUILIBRIUM MODEL FOR A MODERATE PRESSURE HYDROGEN MICROWAVE DISCHARGE PLASMA
Carl D. Scott Apr. 1993 34 p Sponsored by NASA. Johnson Space Center
(NASA-TM-104765; S-715; NAS 1.15:104765) Avail: CASI HC A03/MF A01

This document describes a simple nonequilibrium energy exchange and chemical reaction model to be used in a computational fluid dynamics calculation for a hydrogen plasma excited by microwaves. The model takes into account the exchange between the electrons and excited states of molecular and atomic hydrogen. Specifically, electron-translation, electron-vibration, translation-vibration, ionization, and dissociation are included. The model assumes three temperatures, translational/rotational, vibrational, and electron, each describing a Boltzmann distribution for its respective energy mode. The energy from the microwave source is coupled to the energy equation via a source term that depends on an effective electric field which must be calculated outside the present model. This electric field must be found by coupling the results of the fluid dynamics and kinetics solution with a solution to Maxwell's equations that includes the effects of the plasma permittivity. The solution to Maxwell's equations is not within the scope of this present paper. Author

INFLUENCE OF ALPHA PARTICLE ABSORPTION ON FUNDAMENTAL DEUTERIUM HEATING IN A FUSION PLASMA
N. T. Lam, J. E. Scharer, and R. S. Sund Jan. 1993 15 p
(Contracts DE-FG02-86ER-53218; DE-FG02-93ER-54196)
(DE93-006824; UW-CPTC-93-1) Avail: CASI HC A03/MF A01

Fast wave absorption by fast alpha particles at small concentrations in ITER-like fusion plasmas is examined for the minority deuterium heating scheme. Numerical results are obtained using a full-wave code for slab geometry which solves coupled second order differential equations for the wave fields. The fast alpha particle velocity distribution is approximated by a Maxwellian chosen such that the number of resonant particles in the absorption region matches that of a slowing down distribution. For the cases considered, the fast alpha particle thermal gyroradius satisfies the condition k(perpendicular)(rho)(sub alpha(f))(exp 2) is much less than 1. Substantial absorption can occur when the Doppler-broadened alpha particle resonance extends beyond the D/T two ion hybrid resonance (on the high field side) where the left-hand circularly polarized component of the electric field peaks. HIGH BETA EFFECTS AND NONLINEAR EVOLUTION OF THE TAE INSTABILITY
D. A. Spong 1992 37 p Presented at the United States/Japan Workshop on Theory of High Beta Plasmas, San Diego, CA, 11-13 Nov. 1992
(Contract DE-AC05-84OR-21400)
(DE93-004170; CONF-9211140-1-Vugraphs) Avail: CASI HC A03/MF A01

The toroidal Alfven eigenmode has recently been observed experimentally on DIII-D and TFTR when neutral beams are injected near the Alfven velocity. This instability is also of concern for future high beta D-T devices where fusion by-product alpha populations will generally be super-Alfvenic. We have developed a gyrofluid model (with Landau closure) of the TAE mode which can include most of the relevant damping mechanisms (continuum damping, ion and electron damping, ion FLR and collisional trapped electron damping) as well as reproducing analytically predicted undamped growth rates relatively accurately. An important consideration in predicting future unstable TAE regimes is the effect of finite beta in the background plasma. Due to the Shafranov shift and distortion of the flux surfaces, the location of the stable TAE root and the continuum will shift with increasing beta. The net effect of this is to generally enhance continuum damping and stabilize the TAF instability. Also, as the pressure gradient drive from the background becomes increasingly important, coupling between TAE and background driven modes can alter the TAE mode. A further application of our gyrofluid model which will be discussed is the nonlinear evolution of the TAE instability. Gyrofluid models offer a convenient reduced description which is more amenable to computational nonlinear modeling than full kinetic particle models. Our results demonstrate the rise and crash phases of TAE activity similar to experimental observations. The saturation is caused by generation of m=0 n=0 components through nonlinear beatings of the n greater than 1 modes; these cause modifications to the original equilibrium profiles in such a direction as to decrease the instability drive. This is the gyrofluid analog of direct particle losses. The peak magnetic fluctuation level increases with increasing energetic species beta, resulting in non-resonant stochastization of magnetic field lines. DOE

DEVELOPMENT OF A 100 kW CLASS PLASMA TORCH FOR ASH-MELTING PLASMA FURNACES
M. Shibuya, T. Amakawa, K. Adachi, S. Yasui, M. Iwata, T. Yamazaki (Tokyo Electric Power Co., Inc., Japan.), and K. Kinoshita (Kawasaki Steel Corp., Tokyo, Japan.) Aug. 1991 18 p In JAPANESE
(DE93-754079; CRIE-W-0384) Avail: CASI HC A03/MF A01

Wastes processing technologies are demanded in recent years for wastes increasing especially in urban areas to be turned harmless, reduced in volume, and reutilized as resources. This paper reports development of a 100 kW class plasma torch applicable to ash-melting plasma furnaces and summarizes the results of a performance verification test on the torch trially used in a 300 kW class model plasma furnace. The developed torch is of a low-flow nitrogen gas blowing type using compact and solid tungsten electrodes for the reasons of long-term durability and processing expense reduction. The trial use in the model plasma furnace proved assurance in reducing heat loss, NO(x) contained in the waste gas, and plasma gas cost, as well as the durability as a result of 100-hour continuous operation. The incineration furnace has a melting capacity of 50 kg/100kw h, which could be increased up to 100 kg with practical usefulness if an improvement is given to reduce the size. A prospect was obtained that the ash volume could be reduced by (2/3) by melting and solidifying it. The melting point temperature is about 1200 C, though depending on types of ashes. DOE

DESIGN OF A LARGE-SCALE PLASMA SOURCE ION IMPLANTATION EXPERIMENT
B. P. Wood, J. T. Scheuer, M. A. Nastasi, R. H. Olsher, W. A. Reass, and D. J. Rej 1992 7 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract W-7405-eng-36)
(DE93-005438; LA-UR-92-4141; CONF-921101-33) Avail: CASI HC A02/MF A01

In Plasma Source Ion Implantation (PSII), a target to be implanted is immersed in a weakly ionized plasma and pulsed to a high negative voltage. Ions in the plasma are accelerated toward the target and implanted in its surface, thereby modifying the properties of the surface. Experimental results reported in the literature have generally been for small targets. We present here the design of a large-scale PSII experiment under construction at Los Alamos National Laboratory, in which we plan to implant targets with surface areas of 1-2 sq m to doses of up to 5 x 10(exp 17) cm(exp -2). In presenting this design, we use Monte Carlo and particle-in-cell simulations to examine sheath expansion, implant current and dose, secondary electron emission, target sputtering, implant depth, and x-ray emission resulting from secondary electrons hitting the vacuum chamber wall. Plasmas can sustain many normal modes of oscillation (waves), including both electromagnetic and electrostatic modes. These waves can interact by a wide variety of linear and nonlinear mechanisms, including mode coupling, mixing, and instabilities. Furthermore, such mechanisms compete so that a given wave might be absorbed, might mode convert, or might decay by one of several instabilities, depending upon the specific circumstances in which it is produced. Moreover, such waves are important in many applications, including for example laser fusion, x-ray lasers, plasma accelerators, and ionospheric heating. Laser-produced plasmas can provide an effective medium for the studies of such waves and the related mechanisms. New opportunities will be made possible by the advent of comparatively inexpensive nanosecond, kilojoule lasers. One can now contemplate affordable experiments, not limited by programmatic constraints, that could study such the basic physics of the waves in such plasmas with unprecedented precision and in unprecedented detail. GENERATION OF ULTRA-HIGH MAGNETIC FIELDS BY A DEGENERATE, SNOW-PLOW PINCH
C. W. Hartman, J. L. Eddleman, M. Gee, J. A. Harte, and G. B. Zimmerman 16 Dec. 1992 11 p Presented at the 6th International Conference on Megagauss Magnetic Field Generation and Related Topics, Albuquerque, NM, 9-12 Nov. 1992
(Contract W-7405-eng-48)
(DE93-005831; UCRL-JC-111529; CONF-921133-13) Avail: CASI HC A03/MF A01

We discuss 1-D and 2-D LASNEX calculations of a snow-plow pinch in Xenon. The pinch is driven by inductively stored energy, switched by a compact-torus, fast-opening switch, with performance characteristics calculated by the TRACII, 2-D, MHD code. The 10-cm initial radius, 1 cm long Xe pinch, is driven by 50 MA current thatis switched on in 100 ns. The pinch uniquely undergoes radiative collapse during the snow-plow phase, conforming to the original description of the 'snow-plow', to form a high-density, high-kinetic energy Xe shell which dynamically converges to a pinch equilibrium with degenerate electron pressure, high-density high-magnetic field. The described pinch configuration, calculated in 1-D, is expected to be unstable to R-T, sausage, and kink instabilities. A small initial B(sub zo) field (approximately 100 G) is calculated to be compressed to B(sub z) approximately = B (sub theta) at the final, degenerate, pinch equilibrium, thus stabilizing sausage instability. A larger initial B(sub z) field (approximately 10 kG) is calculated to be compressed by the radiatively collapsing plasma in the snow-plow to B(sub z) approximately = B (sub theta) to stabilize R-T instability during the snow-plow phase. Finally, the kink instability (if it occurs) is expected, as observed, to leave intact the tightly pinched plasma column. DOE

RADIATION MAGNETOHYDRODYNAMIC MODELING OF X RAY OUTPUT FROM PERTURBED PLASMA IMPLOSIONS
D. L. Peterson, R. L. Bowers, J. H. Brownell, A. E. Greene, H. W. Kruse, H. Lee, and W. Matuska 1992 9 p Presented at the 6th International Conference on Megagauss Magnetic Field Generation and Related Topics, Albuquerque, NM, 9-12 Nov. 1992
(Contract W-7405-eng-36)
(DE93-005454; LA-UR-92-3992; CONF-921133-11) Avail: CASI HC A02/MF A01

A goal of the Los Alamos foil implosion project, TRAILMASTER, is the development of a laboratory source of soft x-rays from the magnetically driven implosion of a plasma shell from a thin cylindrical foil. One problem which arises in such implosions is the potential degradation of radiation output due to magnetohydrodynamic instabilities which may exist in the imploding plasma. The result of the instability growth is a thickened plasma shell and the arrival of material and magnetic field on-axis ahead of the plasma shell. This in turn broadens the radiation pulse and lowers the peak temperature which can be obtained from the implosion. Experiments have been performed on the Pegasus 1.5 MJ capacitor bank facility to examine the development of MHD instability growth, the subsequent effect on the radiation pulse, and to provide information which can be used to benchmark our 1-D and 2-D simulations of such implosions. In a fusion reactor, any unanticipated loss of alpha power could result in serious wall damage, impurity influx, major operational control problems, and even a failure to sustain ignition. Neutral beam injection (NBI) experiments in large tokamaks have indicated that toroidicity-induced Alfven eigenmode (TAE) can be strongly unstable and cause the loss of about half of the fast beam ions. This level of loss would be unacceptable in fusion reactors. Recent experiments in TFTR indicate that TAE modes can also be excited by energetic particles heated by ICRF. Stability of TAE modes in the presence of alpha particles had previously been studied by employing a global kinetic-MHD stability code (NOVA-K). The alpha transport due to a single toroidal mode number TAE mode had also been studied by using a Hamiltonian guiding center orbit code, ORBIT. In section 1, we present the properties of the TAE mode, the effects of alpha particles on TAE instabilities for TFTR D-T and ITER experiments. The alpha transport due to multiple toroidal mode number TAE modes and a stochastic transport theory are presented. DOE

A HIGH PERFORMANCE SPECTRAL CODE FOR NONLINEAR MHD STABILITY
M. Taylor Sep. 1992 75 p
(Contract DE-FG02-86ER-53223)
(DE93-004541; DOE/ER-53223/193) Avail: CASI HC A04/MF A01

A new spectral code, NSTAB, was developed to do nonlinear stability and equilibrium calculations for the magnetohydrodynamic (MHD) equations in three dimensional toroidal geometries. The code has the resolution to test nonlinear stability by calculating bifurcated equilibria directly. These equilibria consist of weak solutions with current sheets near rational surfaces and other less localized modes. Bifurcated equilibria with a pronounced current sheet where the rotational transform crosses unity are calculated for the International Thermonuclear Experimental Reactor (ITER). Bifurcated solutions with broader resonances are found for the LHD stellarator currently being built in Japan and an optimized configuration like the Wendelstein V2-X proposed for construction in Germany. The code is able to handle the many harmonics required to capture the high mode number of these instabilities. NSTAB builds on the highly successful BETAS code, which applies the spectral method to a flux coordinate formulation of the variational principle associated with the MHD equilibrium equations. However, a new residue condition for the location of the magnetic axis was developed and implemented. This condition is based on the weak formulation of the equations and imposes no constraints on the inner flux surfaces. DOE

ELECTRON CYCLOTRON EMISSION MEASUREMENTS ON THE TEXAS EXPERIMENTAL TOKAMAK Ph.D. Thesis
Max Eugene Austin, Jr. 1992 133 p
Avail: Univ. Microfilms Order No. DA9237176

A ten-channel grating polychromator was designed, constructed, and installed on the Texas Experimental Tokamak to monitor the second harmonic electron cyclotron emission. Electron temperature profiles were derived from measurements of the optically thick radiation for a variety of plasma confinement experiments. The radial and temporal evolution of T(sub e) has been characterized for electron cyclotron heated discharges with 150 kW of 60 GHz power. Comparisons were made of the heating efficiency of two type of ECH launchers. A focussed launcher was shown to have slightly better heating efficiency than an unfocussed launcher; however, the focussed antenna did not yield significantly higher electron

temperatures as expected. A study of the time evolution of the electron temperature indicated that increased sawtooth activity limited the effectiveness of the focussed launcher. A focussing hog-horn antenna was fabricated and installed on the inboard side of the tokamak to measure emission directed towards the high-field side during ECH. Comparison of the radiation temperature profiles from low-field side and high-field side antennas indicates the creation of a nonthermal electron distribution by the heating. The results of the experiment compare favorably with theoretical predictions from a quasi-linear Fokker-Planck code of a 6 keV nonthermal population with a density about 1 percent of the thermal density.

SELECTION OF AN APPROPRIATE TOKAMAK OPERATING REGIME USING MAGNETOHYDRODYNAMIC AND CURRENT DRIVE CONSTRAINTS Ph.D. Thesis
Marc Louis Klasky 1992 333 p
Avail: Univ. Microfilms Order No. DA9236230

Ideal and resistive MHD stability theories are employed to examine tokamak operating regimes. A constraint on the level of non-inductive current drive, consistent with the previous stability theories, is also considered. These three operational requirements are examined with the ideal energy principle of Bernstein, the resistive principle of Chu, and RF current drive analysis. In this thesis we have found that operation at high aspect ratio (greater than 4) in conjunction with both high axis safety factor (approximately 2) and edge safety factor (approximately 8) satisfies the constraints of being free from both ideal and resistive tearing modes while simultaneously operating at an acceptable level of driven toroidal current due to appearance of the bootstrap current. It has also been found that in order to extend the resistive energy principle of Chu to systems with finite plasma pressure it was necessary to develop a method to treat the singularities that arise in these systems. The Generalized Green's Function method provides such a method to eliminate the numerical singularities. Thus, the formulism to treat the resistive tearing mode stability of finite pressure tokamaks has not been established. Dissert. Abstr.

MULTIPLY CHARGED IONS FROM LASER DRIVEN PLASMA SOURCES Ph.D. Thesis
Myonggwon Park 1992 176 p
Avail: Univ. Microfilms Order No. DA9236158

The temporal and spatial characteristics of plasma ion current produced from the laser irradiation (10(exp 9) - 10(exp 11) W/sq cm at 1.06 microns) on solid targets have been studied experimentally and compared to a simple theoretical model. The data collection and acquisition system includes a Faraday cup coupled with preamplifier circuit, a high speed waveform digitizer, and a computer system interfaced via CAMAC and a GPIB bus. The data obtained with this system proved to be highly reproducible, resulting in reliable and quantitative data analysis. A self-similar hydrodynamic expansion model has been adopted to analyze the laser plasma expansion into the vacuum. The plasma density, expansion velocity, temperature, and pressure in conjunction with the laser beam absorption and dissipation processes are considered as the governing parameters to describe the asymptotic behavior of the laser excited plasma. The numerical calculations demonstrate that the model well represents experimental observations. The results indicate that a substantial fraction of the input laser energy is transported to energetic ions expanding into the vacuum. The fast ions have keV kinetic energies and these energies tend to increase as the irradiation power density increases. At a laser intensity of approximately 10(exp 11) W/sq cm, the ion current distribution begins to show strong directionality along a line normal to the target plane, while at an input beam intensity below 3 x 10(exp 9) W/sq cm, the plasma ion currents show more spherically uniform distributions. Dissert. Abstr.

Avail: CASI HC A01/MF A01

The main emphasis in the evaluation of FIR scattering data was on the evolution of fluctuation spectra at the L-H transition with high temporal resolution and a comparison with other diagnostics recorded simultaneously in a fast multichannel data acquisition system. For FIR frequency shifting, the possibility of using a rotating grating in a multi-diffraction set up where the FIR beam is Doppler shifted several times at the same grating was investigated. Elliptical mirrors were designed to compensate for the distortion of the beam profile. Results for a set-up using 8 diffractions are given. For the numerical calculation of corrugated mirrors, Maxwell's equations were solved by using finite difference equations to obtain the near and far field distributions. The case of perpendicular incidence on corrugated surfaces was treated to obtain the phase shift between the transverse electric (TE) and transverse magnetic (TM) modes in polarization twisters and mode converters. An important aspect for high power applications is the maximum electric field strength in the metallic surface because of the danger of electrical breakdown. Therefore the spatial distribution of the modulus of the electric field was calculated for different groove contours. As an example, the phase shift for polarization twisters is shown for rectangular grooves.

PLASMA FOCUS
H. Herold, R. Aliaga, C. Dumitrescu-Zoita, D. Franz, H. J. Kaeppeler, H. Schmidt, and D. Schulz *In its* Activities Report of the Institute of Plasma Research 1992 p 24-26 (For primary document see N93-23258 08-75)
Avail: CASI HC A01/MF A01

Fast valve for gas puffing in the Poseidon plasma focus experiment is reported. An electromagnetic gas value was built, tested, and applied for first experiments. Linear compression using 'bubbles' is concluded to be a difficult approach for the production of very high density plasmas. DPF-78 experiments are reported. In particular, the following are described: micropinch formation; x-ray spectroscopic measurements; micropinch dynamics; and micropinch emission. ESA

X RAY ABSORPTION SPECTROSCOPY OF DENSE, SHOCK COMPRESSED, LASER PLASMA Ph.D. Thesis
D. A. Goodman 1992 228 p
Avail: Univ. Microfilms Order No. BRD-97222

The central theme of this work involves the diagnosis of shock compressed highly correlated laser plasmas, by observation of the Extended X-ray Absorption Fine Structure (EXAFS) in the absorption spectrum. Measurements have been made using a plane crystal mini-spectrometer and a spectrometer purpose built for EXAFS measurement which employed an elliptically curved x-ray dispersing crystal. Chapter 1 serves as a very brief introduction to the plasma state, and describes how the strongly coupled plasmas which are of interest to this work are created, through laser interaction, and theoretically modelled. Chapters 2, 3 and 4 concern the development and the testing of the elliptical spectrometer. Chapter 2 introduces the theoretical models and concepts which have been developed to predict the behavior of the spectrometer, and demonstrate how these predictions have influenced the spectrometer design. Chapter 3 charts the development of the EXAFS spectrometer from the early plane crystal geometry to the successful elliptical crystal arrangement. Also described is the process by which the x-ray dispersing crystals are bent to the correct elliptical contour. Chapter 4 describes the testing of the elliptical spectrometer prior to EXAFS measurement, in order to assess the viability of the spectrometer alignment procedure and the general viability of the spectrometer as a diagnostic device. Chapter 5 is concerned with the experimental details of the plasma EXAFS studies. The use of both planar and elliptical crystal spectrometers, in the VULCAN glass laser environment is described. Chapter 6 is concerned with the analysis of the experimental results. The models by which the density, temperature and ion correlation are calculated are introduced, and applied to EXAFS measurements from both spectrometers. The results are presented in tabular and graphical form and discussed at length. Chapter 7 assesses the feasibility of replacing x-ray film with a commercially available solid state detector in order to measure the x-ray emission from laser produced plasma. The two types of detector and their relative merits are described, and the results of an experiment designed to compare and contrast their performance is presented. Chapter 8 is a summary of the work presented in this thesis, and suggests some possible avenues for future research. Dissert. Abstr.

EXPERIMENTAL DETERMINATION OF THE HYDRODYNAMIC INSTABILITY GROWTH RATES IN INDIRECT AND DIRECT DRIVE ICF
J. D. Kilkenny, D. H. Munro, S. W. Haan, S. G. Glendining, B. A. Remington, S. V. Weber, R. J. Wallace, H. T. Powell, S. Dixit, and J. P. Knauer et al 1 Sep. 1992 18 p Presented at the 14th International Conference on Plasma Physics and Controlled Nuclear Fusion Research, Wurzburg (Germany), 30 Sep. - 7 Oct. 1992
(Contract W-7405-eng-48)
(DE93-006278; UCRL-JC-110277; CONF-9209290-5; IAEA-CN-56/B-3-2)
Avail: CASI HC A03/MF A01

A comprehensive set of measurements of the growth of ablatively stabilized Rayleigh Taylor instabilities in laser driven direct drive and indirectly drive planar foils is presented. For both cases, imposed single Fourier modes are seen to grow as a planar foil is accelerated. Harmonics of the imposed wavelength are observed as the sinusoidal perturbation becomes a classic bubble and spike. Independent measurements of the foil acceleration are made by sidelighting the foils. For small amplitude initial perturbations, a shaped indirect drive has been used to achieve growth rates as large as 80. Two dimensional simulations of the foils demonstrate excellent agreement with the measured growth rates and non-linear saturation. For both direct and indirect drive, the small amplitude growth rates are seen to be in agreement with simple dispersion relations gamma = alpha (radical)kg - beta kv(sub a) albeit with different values of the constants for the two cases. Further experiments with radiatively accelerated planar foils with two imposed modes of wavenumber k1 and k2 show mode coupling with sum and difference modes, again in agreement with theory. Experiments have also been performed measuring the modulations in areal density of unperturbed foils. The early time non-uniformity of the laser beam can be varied by changing the bandwidth of the SSD smoothing scheme. As the smoothing of the laser drive beam is increased, the degree of non-uniformity of the accelerated foil decreases. For indirect drive there is no measurable non-uniformity of an initially smooth accelerated foil. Indirect drive experiments need a rough foil with a 4 micron surface finish to see any growth of Rayleigh Taylor non-uniformity. DOE

RECENT D3-D RESULTS
T. C. Simonen Oct. 1992 16 p Presented at the 14th International Conference on Plasma Physics and Controlled Nuclear Fusion Research, Wuerzburg, Germany, 30 Sep. - 7 Oct. 1992
(Contracts DE-AC03-89ER-51114; W-7405-eng-48; DE-FG03-89ER-51121; DE-AC05-84OR-21400)
(DE93-004468; GA-A-21089; CONF-920913-25) Avail: CASI HC A03/MF A01

Recent experimental results from the DIII-D tokamak point in directions that could lead to a commercially attractive tokamak demonstration reactor concept, with enhanced confinement, stability, current drive, and divertor performance. These recent results include electric-field and plasma current profile control, noninductive current drive, and divertor power and particle control. Edge radial electric field shear suppresses edge turbulence and improves confinement in H-mode discharges. The electric field extends deeper into VH-mode plasmas and may explain the improved confinement. In VH-mode plasmas the fusion triple product has increased to n(sub D)(0) tau(sub E) T(sub i)(0) = 2 x 10(exp 20) m(sup -3) s keV and the central

electron temperature to 7 keV. Experiments with current profile control have shown improved confinement and stability, access to second stability, and the suppression of TAE modes. Low power fast wave current drive experiments at the 1 MW power level have driven currents at the 0.1 MA level. Divertor experiments indicate that the modeling codes overestimate peak divertor power fluxes. With deuterium gas injection into the divertor, the peak diverter power flux has been reduced by a factor of 5. Edge localized modes (ELMs) are shown to purge helium from the core plasma to the divertor chamber where, in a reactor, the alpha ash could be pumped away. DOE

EQUILIBRIA AND STABILITY OF NON-ADIABATIC VLASOV-MAXWELLIAN PLASMAS Ph.D. Thesis
Brett Alverson Spivey 1992 90 p
Avail: Univ. Microfilms Order No. DA9233698

Adiabatic plasma physics, whereby particles gyrate tightly around magnetic field lines, constitutes a well studied area of plasma physics. On the other hand, plasmas in which a significant number of particles have orbits comparable to the confinement scale have many interesting properties which are not yet well understood. In particular, high energy particles appear to ignore turbulence, and do not behave like fluids. MHD equations cannot generally be adapted to modeling of non-adiabatic plasma; for example, the field reversed configuration is predicted in the MHD model to have a tilt mode instability which is not experimentally observed. We consider in this dissertation the general case of arbitrary orbit size. Specifically, the solutions which we consider are drifted Maxwellian distributions which satisfy the Vlasov equation, and we call these Vlasov-Maxwellian (or V-M) solutions. The Maxwellian form for the distribution function is chosen for its immunity to ion-ion collisional diffusion, which becomes more significant as Larmor radius is increased. We impose the condition that all Maxwellian ion species have common temperature and drift velocity so that the ion-ion collision operator collapses to zero. In section 2 we derive self-consistent equilibria for V-M plasmas. First we show that all V-M plasmas must be rigid rotors. Next we derive the V-M equilibrium equation for a single ion species. Finally we numerically evaluate several solutions in finite geometry. Solutions are found which are field reversed and have high density contrast. In section 3 an electrostatic linear stability analysis is carried out for a restricted class of V-M plasmas. The cases considered involve cylindrical geometry and are finite in the radial direction. A dispersion relation is obtained which is sufficiently simple that a complete investigation of finite orbit stability can be carried out. Both analytic and numerical stability analyses are presented. Dissert. Abstr.

THREE-DIMENSIONAL ISOTHERMAL FLOW SIMULATIONS OF AN MHD SECONDARY COMBUSTOR
J. J. Lee 1993 9 p Presented at the 31st American Institute of Astronautics and Aeronautics Aerospace Sciences Meeting, Reno, NV, 11-14 Jan. 1993
(Contract DE-AC02-79ET-10815)
(DE93-006631; DOE/ET-10815/204; CONF-930108-4; AIAA Paper 93-0816) Avail: CASI HC A02/MF A01

This paper describes numerical prediction of the three-dimensional turbulent nonreacting flow inside an MHD secondary combustor. The Navier-Stokes equations have been solved, using the LEE-3 computer code. The effect of varying jet-to-crossflow velocity ratio and jet angle upon the interaction of the jets and the mainstream has been predicted. The calculated velocity vectors are compared with experimental data based on the same inlet Reynolds numbers. It is observed that the general features of the flow are well predicted, but there are appreciable discrepancies between measured and calculated values. The major disagreements may be due to result from the inlet boundary conditions. DOE

OPTICAL DIAGNOSTICS IN SUPERSONIC PLASMA FLOWS: PURGING FLUID EFFECTS
C. W. Bouchillon, O. P. Norton, and R. L. Cook 1993 10 p Presented at the 31st American Institute of Astronautics and Aeronautics Aerospace Sciences Meeting, Reno, NV, 11-14 Jan. 1993
(Contract DE-AC02-80ET-15601)
(DE93-006243; AIAA Paper 93-0821; CONF-930108-3) Avail: CASI HC A02/MF A01

Magnetohydrodynamic topping cycles are being planned for electrical power production in conjunction with conventional fossil fueled power plants. In order to develop proper designs and to provide for better control and safety, it is desirable to make measurements in the plasma flows which are used in the MHD process. Noninvasive optically based instruments are well suited to this purpose. In order to use these optically based instruments, optically transparent viewports are required to allow observations of the plasma flow conditions. A purge/impulse fluid flow system has been devised to provide continuous optical access to the flow by DIAL. The presence of the purge flows in the supersonic section of the MHD system may have an effect on the flow characteristics and consequently, the effectiveness of the electrical energy generation or on the long-term reliability of the power train. A numerical evaluation of the resulting flow field in a supersonic duct with purge flow viewports has been made and results are presented which illustrate the predicted effects of the purge flow under steady state conditions. The only significant effect on the plasma flow was in the temperature distribution near the wall downstream and in the plane of the viewpoints. DOE

NONLINEAR ANALYSIS OF RELATIVISTIC HARMONIC GENERATION BY INTENSE LASERS IN PLASMAS Interim Report
Eric Esarey, Antonio Ting, Phillip Sprangle, Donald Umstadtert, and X. Liut 8 Jan. 1993 32 p
(AD-A260092; NRL/MR/6790-93-7158) Avail: CASI HC A03/MF A01

A linearly polarized, ultra-intense laser field induces transverse plasma currents which are highly relativistic and nonlinear, resulting in the generation of coherent harmonic radiation in the forward direction (i.e., co-propagating with the incident laser field). A nonlinear cold fluid model, valid for ultrahigh intensities, is formulated and used to analyze relativistic harmonic generation. The plasma density response is included self-consistency and is shown to significantly reduce the current driving the harmonic radiation. Phase detuning severely limits the growth of the harmonic radiation. The effects of diffraction are considered in the mildly relativistic limit. No third harmonic signal will emerge from a uniform plasma of near infinite extent. A finite third harmonic signal requires the use of a semi-infinite or finite slab plasma. For an initially uniform plasma, no second harmonic radiation is generated. Generation of even harmonics requires transverse gradients in the initial plasma density profile. GRA

SPACE CHARGE LAYERS IN A DOUBLE PLASMA MACHINE Ph.D. Thesis
G. Hassall 1991 240 p
Avail: Univ. Microfilms Order No. BRD-97312

The formation of space charge layers in a gas discharge system is responsible for many varied phenomena with perhaps the most common example being the wall-sheath. Increasing the number of layers can further complicate the self-consistent potential structure of this region which may, in turn, modify the behavior of the overall system. This thesis describes both experimental and numerical studies in which structures such as these were investigated. In the experimental phase of this work, a Triple Plasma Machine (TPM) was used in a Double Plasma Machine (DPM) configuration. Extensive preliminary evaluation experiments were conducted in which the characteristics of both the multidipole plasma source and the experimental chamber were studied. From this it was possible to estimate the form of the particle distribution injected into the target chamber which produces these space charge structures adjacent to the emitting surface represented by the plasma source in much the same way that a sheath forms adjacent to hot electron emitting cathode in a conventional discharge tube experiment. Studies of their evolution as functions of various machine parameters produced distinct correlations between their detailed potential structure and properties such as the device current-voltage characteristics. As an aid to interpreting some of the experimental results a simple one-dimensional steady state Vlasov-Poisson model was constructed which helped evaluate the influence of each of the electron and ion populations suggested by results of the experimental work. Although of limited use because of its time independence it could show that anomalies observed in the sheath structures noted in this work and elsewhere could be reproduced using a realistic combination of the particle populations indicated in the experimental stages of this thesis. Dissert. Abstr.

ANALYSIS OF NON-THERMAL ELECTRON CYCLOTRON EMISSION DURING ELECTRON CYCLOTRON CURRENT DRIVE EXPERIMENTS ON THE D3-D TOKAMAK Ph.D. Thesis
Scott J. Janz 1992 165 p
Avail: Univ. Microfilms Order No. DA9234586

Non-thermal electron distributions are diagnosed employing a fast scanning Michelson Interferometer which is capable of viewing the plasma vertically (constant B(sub toroidal)) along a chord at r/a approx. = .6 terminated by a highly absorptive Macor viewing dump, and horizontally at the midplane. Extraordinary (X) mode and Ordinary (O) mode polarizations of Electron Cyclotron Emission (ECE) in the second to the tenth harmonic of the fundamental electron cyclotron frequency have been collected under a variety of plasma conditions, during high power microwave injection at 60 GHz in the DIII-D Tokamak. Plasma refraction limits the data analysis to frequencies above the fifth harmonic where the data is characterized by a smooth, exponentially decreasing intensity, due to the high degree of harmonic overlap in this frequency range. Analysis of this data has shown the extreme sensitivity of this diagnostic to emission from high pitch angle particles. Results of delta function distribution calculations and distribution function fitting show that for a low density target plasma (central line averaged n(sub e) = 0.5 x 10(exp 13) cm(exp -3)), the emission is dominated by electrons near the trapping boundary at our viewing location, with average energies 400 keV less than (E) less than 500 keV during ECH. Under higher plasma target density conditions (central line averaged n(sub e) = 1.0 x 10(exp 13) cm(exp -3)) the population of electrons during ECH contributing to the emission increases in average energy to (E) approx. = 1.2 MeV as a result of the residual electric field induced by the primary transformer. Non-thermal electron densities (n(sub hot)) of approx. 1 x 10(exp 10) cm(exp -3) are estimated during the ECH phase while the post-ECH phase is characterized by a very diffuse (n(sub hot) approx. 5 x 10(exp 7) cm(exp -3)), energetic ((E) approx. 1.5 MeV), population in the trapped region of momentum space. Dissert. Abstr.

N93-24294 California Univ., Davis.
POLOIDAL MAGNETIC FIELD PROFILE MEASUREMENTS ON THE MICROWAVE TOKAMAK EXPERIMENT USING FAR-INFRARED POLARIMETRY Ph.D. Thesis
Bradley Woodward Rice 1992 251 p
Avail. Univ. Microfilms Order No. DA9302621

The measurement of plasma poloidal magnetic field (B(theta)) profiles on tokamaks with good temporal and spatial resolution has proven to be a difficult but important measurement. A large range of toroidal confinement phenomena is expected to depend sensitively on the radial variation of B(theta) (or equivalently the current density J or safety factor q) including the tearing instability, sawtooth oscillations, disruptions, and transport. Experimental confirmation of theoretical models describing these phenomena has been hampered by the lack of detailed B(theta) measurements. A fifteen chord far-infrared (FIR) polarimeter has been developed to measure B(theta) in the Microwave Tokamak Experiment (MTX). Polarimetry utilizes the well-known Faraday rotation effect, which causes a rotation of the polarization of an FIR beam propagating in the poloidal plane. The rotation angle is proportional to the component of B(theta) parallel to the beam. A new technique for determining the Faraday rotation angle is introduced, based on phase measurements of a rotating polarization ellipse. This technique simplifies the implementation of large multi-chord systems, and minimizes the effect of amplitude variations caused by refraction. This instrument has been used successfully to measure B(theta) profiles for a wide range of experiments on MTX. For ohmic discharges, measurements of the safety factor on axis give q(0) approximately 0.75 during sawteeth and q(0) greater than 1 without sawteeth. Large perturbations to the polarimeter signals correlated with the sawtooth crash are observed during some discharges. Measurements in discharges with electron cyclotron heating (ECH) show a transition from a hollow to peaked J profile that is triggered by the ECH pulse. Heavy-metal impurity radiation is believed to be the cause of the initially hollow profile. Current-ramp experiments were done to perturb the J profile from the nominal Spitzer conductivity profile. Profiles for initial current ramps and ramps starting from a stable equilibrium have been measured and are compared with cylindrical diffusion model. Finally, the tearing model stability equation is solved using measured J profiles. Stability predictions are in good agreement with the existence of oscillations observed on the magnetic loops. Dissert. Abstr.

(Contract DE-FG02-84ER-53174)
(DE93-007617; DOE/ER-53174/T1) Avail: CASI HC A02/MF A01

Three principal topics are covered in this final report: Stabilization of low frequency modes of an axisymmetric compact torus plasma confinement system, such as, spheromaks and FRC'S, by a population of large orbit axis encircling energetic ions. Employing an extension of the 'energy principle' which utilizes a Vlasov description for the energetic 'ion component, it has been demonstrated that short wavelength MHD type modes are stabilized while the long wavelength tilt and precessional modes are marginally stable. The deformation of the equilibrium configuration by the energetic ions results in the stabilization of the tilt mode for spheromaks. Formation of Ion Rings and their coalescence with spheromaks. A two dimensional electromagnetic PIC codes has been developed for the study of ion ring formation and its propagation, deformation and slowing down in a cold plasma. It has been shown that a ring moving at a speed less than the Alfven velocity can merge with a stationary spheromak. Anomalous transport from drift waves in a Tokamak. The Direct Interaction Approximation in used to obtain incremental transport coefficients for particles and heat for drift waves in a Tokamak. It is shown that the transport matrix does not obey Onsager's principle. DOE

TRITIUM PERMEATION MODEL FOR PLASMA FACING COMPONENTS
G. R. Longhurst Dec. 1992 45 p
(Contract DE-AC07-76ID-01570)
(DE93-007044; EGG-FSP-10609) Avail: CASI HC A03/MF A01

This report documents the development of a simplified one-dimensional tritium permeation and retention model. The model makes use of the same physical mechanisms as more sophisticated, time-transient codes such as implantation, recombination, diffusion, trapping and thermal gradient effects. It takes advantage of a number of simplifications and approximations to solve the steady-state problem and then provides interpolating functions to make estimates of intermediate states based on the steady-state solution. The model is developed for solution using commercial spread-sheet software such as Lotus 123. Comparison calculations are provided with the verified and validated TMAP4 transient code with good agreement. Results of calculations for the ITER CDA diverter are also included. DOE

EFFECT OF A POLOIDAL ELECTRIC FIELD ON NEOCLASSICAL TRANSPORT IN A MULTISPECIES TOKAMAK PLASMA
K. Indireshkumar and W. M. Stacey Dec. 1992 57 p
(PB93-146215; GTFR-106) Avail: CASI HC A04/MF A01

The effects of a poloidal potential variation of order epsilon, which is likely to be produced during high power cyclotron wave heating or neutral beam injection, upon neoclassical particle transport and plasma current are studied theoretically for a realistic tokamak plasma with significant impurity content. Using an approximate collision operator, an analytic procedure is employed to calculate the transport coefficients in the low collisionality regime for a large aspect ratio tokamak. In the presence of carbon impurity, the ion diffusion coefficients are generally found to increase by a factor of about 2. Inclusion of the effects of a poloidal electric field is found to result in an increase in the bootstrap current if the potential on the outside of the tokamak is greater than that on the inside (as during ICRH or NBI) and the density profiles are more peaked than roughly the square root of the temperature profiles. OSCILLATORY INTERLAYER MAGNETIC COUPLING OF SPUTTERED Fe/Nb SUPERLATTICES
J. E. Mattson, E. E. Fullerton, C. H. Sowers, Y. Y. Huang, G. P. Felcher, and S. D. Bader Sep. 1992 13 p Presented at the Conference on Magnetism and Magnetic Materials, Houston, TX, 1-4 Dec. 1992
(Contract W-31-109-eng-38)
(DE93-004191; ANL/CP-76458; CONF-921201-11) Avail: CASI HC A03/MF A01

The saturation field of sputtered Fe/Nb superlattices oscillates as a function of the Nb thickness with a periodicity of approximately 9 A. In contrast to the case of Fe/Cr superlattices, the concurrent magnetoresistance oscillations were found to be very weak. Yet polarized neutron reflection measurements confirm that the Fe/Nb superlattices with high saturation field possess a magnetic ground state of the + - + - type. Neutron and x-ray measurements indicate that, while the crystalline and antiferromagnetic order is well developed along the thickness of the film, the average lateral size of the crystallites (as well as of the magnetic domains) is quite small. This effect (thought to be related to the gross mismatch of the iron and the niobium crystal lattices) may be the cause of the high overall resistance of the material, and its weak dependence on the magnetization. MAGNETIC DECOUPLING IN SPUTTERED Fe/Si SUPERLATTICES AND MULTILAYERS
E. E. Fullerton, J. E. Mattson, S. R. Lee, C. H. Sowers, Y. Y. Huang, G. Felcher, S. D. Bader, and F. T. Parker Sep. 1992 14 p Presented at the Conference on Magnetism and Magnetic Materials, Houston, TX, 1-4 Dec. 1992

(Contract W-31-109-eng-38)
(DE93-004204; ANL/CP-76457; CONF-921201-10) Avail: CASI HC A03/MF A01

A series of sputtered Fe/Si superlattices was grown to study the magnetic coupling between ferromagnetic Fe layers (30 A thick) for Si spacer-layer thicknesses (t(sub Si)) between 10 and 40 A. The material is ferromagnetically coupled for t(sub Si) less than 13 A and antiferromagneticly coupled for 13 A less than t(sub Si) less than 17 A. For t(sub Si) greater than 17 A, the magnetic Fe layers are uncoupled. The x-ray analysis indicates that the system is well layered, but that the crystal structure remains coherent only for t(sub Si) less than 17 A. These results, along with our Moessbauer investigation, strongly suggest that the Si layer is crystalline for t(sub Si) less than 17 A, and is iron silicide in nature. For thicker spacers, Si becomes amorphous. We propose a model of the layering that is consistent with the known properties of Fe-silicide. DOE

PROCESSING AND MICROSTRUCTURAL DEVELOPMENT OF Ag-CLAD Bi-Sr-Ca-Cu-O TAPES
R. B. Poeppel, K. C. Goretta, U. Balachandran, A. C. Biondo, S. E. Dorris, S. C. Hathcox, D. Y. Kaufman, M. T. Lanagan, B. C. Prorok, and C. T. Wu et al Oct. 1992 5 p Presented at the 5th US/Japan Workshop on High Tc Superconductors, Tsukuba, Japan, 9-10 Nov. 1992
(Contract W-31-109-eng-38)
(DE93-004201; ANL/MCT/CP-76909; CONF-9211144-1) Avail: CASI HC A01/MF A01

Ag-clad Bi2Sr2CaCu2O(x)(2212) and (Bi,Pb)2Sr2Ca2Cu3O(x)(2223) tapes were fabricated by drawing and rolling. Highly textured microstructures and high critical current density values were obtained for each system. However, the heat treatments and phase evolutions for 2212 and 2223 were different. For 2212, nearly phase-pure powder was used, and the heat treatments consisted of partial melting followed by solid-state sintering. For 2223, several compositions, initial phases, and sintering schedules were used. Results are discussed in terms of microstructural evolution as observed by X-ray diffraction and scanning and transmission electron microscopy. DOE

CHEMICALLY PREPARED Pb(Zr,Ti)O3 THIN FILMS: THE EFFECTS OF ORIENTATION AND STRESS
B. A. Tuttle, J. A. Voigt, D. C. Goodnow, R. W. Schwartz, D. L. Lamppa, T. J. Headley, M. O. Eatough, and T. J. Garino 1992 18 p Presented at the 8th IEEE International Symposium on Applications of Ferroelectronics, Greenville, SC, 30 Aug. - 2 Sep. 1992
(Contract DE-AC04-76DP-00789)
(DE93-004501; SAND-92-2111C; CONF-9208197-1) Avail: CASI HC A03/MF A01

The effects that orientation and stress have on chemically prepared Pb(Zr,Ti)0(3)(PZT) film properties are determined. Systematic modification of the underlying substrate technology has permitted us to fabricate suites of films that have various degrees of orientation at a constant stress level, and to also fabricate films that are in different states of stress, but have similar orientation. Highly oriented films of the following compositions were fabricated: PZT 60/40, PZT 40/60, and PZT 20/80. Remanent polarizations (approximately 60 microC/sq cm) greater than the best bulk polycrystalline ferroelectrics were obtained for PZT 40/60 films that were under compression and highly (001) oriented. While it was shown that systematically varying orientation influences ferroelectric properties, film stress also has a considerable effect. Perhaps the most important concept is that the sign of the film stress at the Curie point controls the type of ferroelectric behavior exhibited by PZT thin films. Further, the stress measurements as a function of thermal history indicate that the coefficient of thermal expansion of the paraelectric state is critical in determining the type of film ferroelectric behavior. POLYCRYSTALLINE THIN FILMS Project Report, FY 1992
K. Zweibel, ed. Jan. 1993 20 p
(Contract DE-AC02-83CH-10093)
(DE93-000070; NREL/TP-413-5270) Avail: CASI HC A03/MF A01

This report summarizes the activities and results of the Polycrystalline Thin Film Project during FY 1992. The purpose of the DOE/NREL PV (photovoltaic) Program is to facilitate the development of PV that can be used on a large enough scale to produce a significant amount of energy in the US and worldwide. The PV technologies under the Polycrystalline Thin Film Project are among the most exciting 'next-generation' options for achieving this goal. Over the last 15 years, cell-level progress has been steady, with laboratory cell efficiencies reaching levels of 15 to 16 percent. This progress, combined with potentially inexpensive manufacturing methods, has attracted significant commercial interest from US and international companies. The NREL/DOE program is designed to support the efforts of US companies through cost-shared subcontracts (called government/industry partnerships) that we manage and fund and through collaborative technology development work among industry, universities, and our laboratory. EVOLUTION AND DYNAMICS OF EXCIMER LASER VAPORIZED YBa2Cu3O(7-DELTA) PLUMES
R. C. Dye, R. Brainard, S. R. Foltyn, R. E. Muenchausen, Xin-Di Wu, and N. S. Nogar 1992 13 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract W-7405-eng-36)
(DE93-005474; LA-UR-92-4260; CONF-921101-49) Avail: CASI HC A03/MF A01

Pulsed laser deposition of thin films is a technology whose fundamental processes are often poorly understood. Because of the difficulty of monitoring in real time either the ablation process itself (the laser-solid interaction), or thin film growth (plume-substrate interaction), studies have largely relied on diagnostic studies of the ablated plume and the resulting film to infer details about other steps in the process. Information gained from this approach has helped improve the production of high-temperature superconducting thin films. We have studied plume dynamics during the in-situ pulsed laser deposition of YBa2Cu3O(7-delta) thin films. The 248 and 308 nm lines of an excimer laser were used to generate a plume from a bulk YBa2Cu3O(7-delta) target. Both fast intensified CCD imaging and spectral diagnostics were used to monitor plume dynamics. Variations in the plume distribution as a function of processing gas, pressure, fluence, energy, and spot size were monitored by film composition and spectral- and time-resolved imaging. DOE

IMPLICATIONS OF DEFECT CLUSTERS FORMED IN CASCADES ON FREE DEFECT GENERATION AND MICROSTRUCTURAL DEVELOPMENT
H. Wiedersich Dec. 1992 28 p Presented at the 3rd Conference on Evolution of Microstructure in Metals During Irradiation, Chalk River, Ontario, 29 Sep. - 2 Oct. 1992
(Contract W-31-109-eng-38)
(DE93-005551; ANL/MSD/CP-78287; CONF-920970-6) Avail: CASI HC A03/MF A01

A large fraction of the defects produced by irradiation with energetic neutrons or heavy ions originates in cascades. Not only increased recombination of vacancy and interstitial defects but also significant clustering of like defects occur. Both processes reduce the number of point defects available for long range migration. Consequences of defect clustering in cascades will be discussed in a semi-quantitative form with the aid of calculations using a very simplified model: Quasi-steady-state distributions of immobile vacancy and/or interstitial clusters develop which, in turn, can become significant sinks for mobile defects, and, therefore, reduce their lifetime. Although cluster sinks will cause segregation and, potentially, precipitation of second phases due to local changes of composition, the finite lifetime of clusters will not lead to lasting, local compositional changes. A transition from highly dense interstitial and vacancy cluster distributions to the void swelling regime occurs when the thermal evaporation of vacancies from small vacancy clusters becomes significant at higher temperatures. Unequal clustering of vacancies and interstitials leads to an imbalance of their fluxes of in the matrix and, hence, to unequal contributions to atom transport by interstitials and by vacancies even in the quasi-steady state approximation. METALLIZATION AND INSULIZATION DURING IMPACT

J. J. Gilman Oct. 1992 12 p Presented at the Hypervelocity Impact Symposium, Austin, TX, 17-20 Nov. 1992
(Contract DE-AC03-76SF-00098)
(DE93-004708; LBL-33020; CONF-921162-15) Avail: CASI HC A03/MF A01

It is pointed out that the large strains produced by hypervelocity impacts can be expected to produce dramatic changes in the chemical bonding (electronic structures) of materials. This will change the mechanical behavior towards increased ductility when a semiconductor is compressed until it becomes metallic; and towards increased brittleness when a transition metal is expanded so as to localize its d-band electrons. Both isotropic compression (expansion) and shear strains can cause these transformations. Critical deformation criteria are given based on the observed cubic to tetragonal transformations in compressed semiconductors. DOE

LOCAL VIBRONIC AND ELECTRONIC EXCITATIONS OF DOPING-INDUCED STATES IN THE COPPER OXIDES
K. Yonemitsu, A. R. Bishop, and J. Lorenzana (International School for Advanced Studies, Trieste, Italy.) 1992 11 p Presented at the 2nd Cinvestav Superconductivity Symposium, Tequisquiapan, Mexico, 2-6 Nov. 1992
(Contract W-7405-eng-36)
(DE93-003844; LA-UR-92-3808; CONF-9211133-1) Avail: CASI HC A03/MF A01

Doping states in the copper oxides are investigated in a two-dimensional, three-band Peierls-Hubbard model. We consider displacements of planar O atoms along the Cu-O bonds, and focus on intersite electron-phonon interactions modifying the hopping integral between the Cu and O orbitals. Hartree-Fock configurations of polaronic states in the antiferromagnetic background are sensitively affected by weak electron-phonon interaction. Vibronic and optical excitation spectra, obtained with the random phase approximation, contain doping-induced structures caused by excitation modes localized around the polarons. A dimensionless strength of the electron-phonon interaction is deduced from a comparison with recent generalized inhomogeneous LDA calculations. The nature of doping states is quite different from that described within purely electronic, Hubbard, and t-J models. DOE

ELECTRONIC STRUCTURE STUDIES OF YBa2Cu3O(x)(6.2 LESS THAN EQUAL TO X LESS THAN OR EQUAL TO 6.9) USING ANGLE RESOLVED PHOTOEMISSION
B. W. Veal, Rong Liu, A. P. Paulikas, D. D. Koelling, J. W. Downey, Hao Shi (Missouri Univ., Kansas City.), and C. G. Olson (Ames Lab., IA.) Nov. 1992 49 p Presented at the 10th International Summer Institute in Surface Science (ISISS) Meeting, Milwaukee, WI, 29 Jun. - 2 Jul. 1992
(Contracts W-31-109-eng-38; W-7405-eng-82)
(DE93-004811; ANL/MSD/CP-77995; CONF-9206332-1) Avail: CASI HC A03/MF A01

Using high resolution angle resolved photoemission, the electronic structure of YBa2Cu3O(x) is examined when oxygen stoichiometries are varied in the range 6.2 less than or equal to x less than or equal to 6.9. Detailed measurements of the Fermi surface for YBa2Cu3O(6.9) are presented and are compared with predictions of band theory. In the metallic region of the phase diagram, changes in the Fermi surfaces are measured as a function of oxygen stoichiometry. The electronic structure is monitored as the oxide changes from a metal to a semiconductor with additional oxygen depletion. For intermediate stoichiometries, effects of oxygen vacancy ordering are considered. Unusual resonant effects observed at several photon energies are examined as oxygen content is varied. DOE

ADVANCED DIELECTRICS FOR PASSIVATION OF InSb
J. C. Barbour, S. A. Casalnuovo, and S. R. Kurtz 1992 6 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC04-76DP-00789)
(DE93-005353; SAND-92-1593C; CONF-921101-47) Avail: CASI HC A02/MF A01

A combination of Electron Cyclotron Resonance (ECR) plasma, electrochemical, and chemical growth process were examined to synthesize dielectric surface passivation layers on InSb. The material properties of ECR-grown SiO(x)N(y) on InSb at temperatures from 30 C to 250 C were investigated. Composition analysis was done using Rutherford backscattering spectrometry (RBS) and elastic recoil detection (ERD). The electrical quality of the passivation layer was characterized with capacitance-voltage (CV) measurements on metal-insulator-semiconductor structures over the frequency range from 1 kHz to 1 MHz. Sulfided layers, Si3ON2 on InSb, and sulfided layers capped with Si3ON2 all exhibited good C-V properties consistent with interface state densities on the order of 10(exp 11)/cm(exp 2)-eV, and flatband voltages of magnitude less than 1 V. The difference in adhesion of Si3N4 on InSb and the adhesion of Si3ON2 on InSb was described in terms of the strength of the bonding at the dielectric-InSb interface. This work is the first to demonstrate passivation of an InSb surface with high-quality ECR silicon oxynitrides grown at room temperature. DOE

THE NUCLEATION AND GROWTH OF URANIUM ON THE BASAL PLANE OF GRAPHITE STUDIED BY SCANNING TUNNELING MICROSCOPY Ph.D. Thesis
R. J. Tench Nov. 1992 62 p
(Contract W-7405-eng-48)
(DE93-006279; UCRL-LR-112417) Avail: CASI HC A04/MF A01

For the first time, nanometer scale uranium clusters were created on the basal plane of highly oriented pyrolytic graphite by laser ablation under ultra-high vacuum conditions. The physical and chemical properties of these clusters were investigated by scanning tunneling microscopy (STM) as well

as standard surface science techniques. Auger electron and X-ray photoelectron spectroscopies found the uranium deposit to be free of contamination and showed that no carbide had formed with the underlying graphite. Clusters with sizes ranging from 42 to 630 sq A were observed upon initial room temperature deposition. Surface diffusion of uranium was observed after annealing the substrate above 800 K, as evidenced by the decreased number density and the increased size of the clusters. Preferential depletion of clusters on terraces near step edges as a result of annealing was observed. The activation energy for diffusion deduced from these measurements was found to be 15 Kcal/mole. Novel formation of ordered uranium thin films was observed for coverages greater than two monolayers after annealing above 900 K. These ordered films displayed islands with hexagonally faceted edges rising in uniform step heights characteristic of the unit cell of the P-phase of uranium. In addition, atomic resolution STM images of these ordered films indicated the formation of the (beta)-phase of uranium. The chemical properties of these surfaces were investigated and it was shown that these uranium films had a reduced oxidation rate in air as compared to bulk metal and that STM imaging in air induced a polarity-dependent enhancement of the oxidation rate. DOE

MAGNETIC COUPLING OF Fe/Mo/Fe AND Co/Cu/Co SANDWICHES ACROSS WEDGED SPACER LAYERS
Z. Q. Qiu, J. Pearson, and S. D. Bader Sep. 1992 25 p Presented at the Conference on Magnetism and Magnetic Materials, Houston, TX, 1-4 Dec. 1992
(Contract W-31-109-eng-38)
(DE93-004203; ANL/CP-76470; CONF-921201-12) Avail: CASI HC A03/MF A01

Fe/Mo/Fe and Co/Cu/Co sandwiches were grown by molecular beam epitaxy onto Mo(100) and Cu(100) single crystals, respectively, and characterized by high- and low-energy electron diffraction and in-situ surface magneto-optic Kerr-effect measurements. The spacer layer in both case was fabricated to have a wedged shape in order to create a continuous change of the spacer-layer thickness. Oscillatory behavior between ferromagnetic and antiferromagnetic coupling was found; and is shown to originate at the interface between the magnetic layer and the spacer layer. For Fe/Mo/Fe, short-period oscillations are observed with a periodicity of approximately 3ML of Mo. Hysteresis loops for antiferromagnetically coupled cases are calculated from a simple model; results reproduce the general characteristics observed experimentally. DOE

INVESTIGATION OF THE KINETICS OF SURFACE-LIMITED THIN FILM GROWTH OF SiGe ALLOYS
J. W. Sharp (Tennessee Univ., Knoxville.) and G. Eres Nov. 1992 6 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-005419; CONF-921101-36) Avail: CASI HC A02/MF A01

The kinetics of surface-limited thin film growth of SiGe alloys was investigated by time-resolved surface differential reflectometry. The source gas, mixtures of disilane and digermane in ratios from 1:1 to 6:1 in helium carrier gas, was delivered to a heated substrate by a fast-acting pulsed molecular jet valve. The adsorption and desorption kinetics were determined from the surface differential reflectance signal obtained using a polarized, high-stability HeNe probe laser. Thin film growth was studied in the temperature range of 400-600 C on Si(001) substrates. Preferential incorporation of digermane into the film produces an alloy composition that depends upon but does not mirror the gas composition. For all gas mixtures, there is a strong temperature dependence of the rate at which the adsorption layer decomposes into film plus by-product. The kinetic data and the alloy compositions provide a basis for deducing some of the characteristics of the reaction sequence that leads to SiGe alloy thin film growth. DOE

METALLO-ORGANIC SOLUTION DEPOSITION OF FERROELECTRIC PZT FILMS
Russell A. Lipeles, Martin S. Leung, and Dianne J. Coleman 9 Sep. 1992 30 p
(Contract F04701-88-C-0089)
(AD-A260127; TR-0090(5945-02)-1; SMC-TR-92-42) Avail: CASI HC A03/MF A01

The metallo-organic solution deposition ((MOSD) or sol-gel) technique can be used for preparing lead zirconate titanate (PZT) ceramics with a wide range of compositions and crystal structures for electro-optical applications. Film morphology is affected by stoichiometry of the film, hydrolysis and polymerization of the sol-gel solution, and thermal treatment of the deposited material. The lattice parameter decreases with the amount of titanium in PZT in agreement with ceramic data. A slight initial excess of lead in the coating solution is found to improve film morphology. Unlike traditional powder ceramic processing techniques, MOSD permits the growth of small uniform grains that are conducive to achieving consistent electronic and optical properties. Our results show that the properties of films prepared by the MOSD process can be tailored to meet the needs of device applications. GRA

GROWTH OF PRECIPITATES IN Bi2Sr2CaCu2O8
M. Xu, J. Polonka, A. I. Goldman, D. K. Finnemore, and S. McKernan 1992 8 p Presented at the 3rd International Conference and Exhibition of the World Congress on Superconductivity, Munich, Germany, 14-19 Sep. 1992
(Contract W-7405-eng-82)
(DE93-004443; IS-M-729; CONF-920916-3) Avail: CASI HC A02/MF A01

In the formation of Bi2Sr2CaCu2O8 from a Ca and Cu rich melt, the partial pressure of oxygen is a central factor controlling the phases that form as precipitates in the host superconductor. At a high oxygen pressure, a sample with a stoichiometry of Bi2Sr2Ca2Cu3O10 will form (Sr,Ca)2CuO3 as the dominant precipitate coexisting with the liquid from which Bi2Sr2CaCu2O8 forms. During the crystallization of Bi2Sr 2CaCu2O8 from this liquid, part of the (Sr,Ca)2CuO3 phase is consumed. By contrast, at low oxygen partial pressure a sample with the same stoichiometry will form CaO as the dominant precipitate coexisting with the liquid from which Bi2Sr2CaCu2O8 forms. In this case, some of the CaO is consumed and a Ca rich (Sr,Ca)2CuO3 phase forms during the Bi2Sr 2CaCu2O8 crystallization. Oxygen partial pressure is a key factor controlling the sequence of precipitates that form in the host superconductor. The precipitate can serve as pinning sites for magnetic flux. DOE

PHASE DIAGRAM EFFECTS IN RAPID THERMAL PROCESSING OF REBa2Cu3O(7-DELTA)
R. W. McCallum, M. J. Kramer, and S. T. Weir (California Univ., Livermore. Lawrence Livermore Lab.) 24 Aug. 1992 4 p Presented at the Applied Superconductivity Conference, Chicago, IL, 23-28 Aug. 1992
(Contract W-7405-eng-82)
(DE93-004445; IS-M-733; CONF-920802-41) Avail: CASI HC A01/MF A01

Recent investigations of rapid thermal processing of REBa2Cu3O(7-delta) by drop tube melting, laser surface treatment and shock compaction have shown that the microstructure resulting from these processes is a complex mixture of non-equilibrium phases. While it is tempting to ascribe the variations in microstructure to variations in quench rates between the processes, we will demonstrate that with the exception of extremely rapid solidification from above the liquidus, the microstructure and phase distribution results from the heating rather than the cooling part of the curve. Since all of the above processes induce non-uniform heating, different parts of the sample reach different maximum temperatures. The maximum temperature reached, and the time spent near that maximum, uniquely determine the starting state of the quench. If the entire sample is not above the liquidus the sluggishness of the peritectic reactions results in similar microstructure regardless of the quench rate. Upon annealing the final microstructure is much more dependent on the number of nucleation sites than on the type of site resulting in a uniform REBa2Cu3O(7-delta) microstructure over a broad range of processing parameters. DOE

CRITICAL CURRENT ENHANCEMENT BY NEUTRON IRRADIATION OF RAPIDLY TEXTURED BiSr2CaCu2O8
M. J. Kramer, S. R. Arrasmith, R. W. McCallum, and J. W. Farmer 24 Aug. 1992 4 p Presented at the Applied Superconductivity Conference, Chicago, IL, 23-28 Aug. 1992
(Contracts W-7405-eng-82; DE-FG02-90ER-45427)
(DE93-004453; IS-M-731; CONF-920802-39) Avail: CASI HC A01/MF A01

We have investigated the effect of fast neutron irradiation on c-axis aligned Bi2Sr2CaCu2O8 (Bi2212) produced using a new technique. Amorphous Bi2212 was crystallized under 20 MPa uniaxial stress at 870 C for 6 hrs. DC SQUID shows a transition onset of 90K. Material was cut into 2 x 2 x 0.150 mm slabs, sealed in quartz ampules, and irradiated at fluences of 10(exp 16), 5 x 10(exp 16), 2.5 x l0(exp 17), and 7.2 x 10(exp 17) n/sq cm. DC SQUID results show that J(sub c) is increased by a factor of 2.5 at 10K for fluences of 7.2 x 10(exp 17) for H parallel to c-axis for fields less than 3 T. The higher the fluence, the lower the dependency of J(sub c) on applied field and temperature. T(sub c) decreased by 1 K for a fluence of 2.5 x 10(exp 17) n/sq cm with an additional 2 K drop for 7.2 x 10(exp 17) n/sq cm. The increase in the width of the high field hysteresis loops for increasing fluence is more pronounced for samples measured normal to the c-axis. DOE

A COMPARISON OF TWIN BOUNDARY PINNING IN NEARLY FULLY STOICHIOMETRIC AND OXYGEN DEFICIENT YBa2C((LC)U3O(7-DELTA)
S. Fleshler, W. K. Kwok, U. Welp, J. Downey, and G. W. Crabtree Nov. 1992 4 p Presented at the Applied Superconductivity Conference, Chicago, IL, 23-28 Aug. 1992
(Contract W-31-109-eng-38)
(DE93-004854; ANL/MSD/CP-78124; CONF-920802-46) Avail: CASI HC A01/MF A01

The angular dependence of the magnetoresistance was measured on the same single crystal of a YBa2Cu3O(7-delta) prepared initially with a superconducting transition temperature of 93.0K and then annealed to obtain a transition temperature of 56.9K. A second oxygen deficient sample was produced with a transition temperature 57.0K and nearly identical transport characteristics. Twin boundary pinning superimposed on flux flow behavior was observed in both the 56.9K and 93.0K states for magnetic field rotation in ab plane. For magnetic field rotations off the c axis we observe twin boundary pinning only for the nearly stoichiometric state. We find the broadening of the resistive transition in magnetic field (H parallel c) to occur over a much larger interval of reduced temperature in the deoxygenated state. The enhanced broadening of the resistive transition in magnetic field and absence of twin boundary pinning may indicate that the vortex system is two dimensional and in general, defects are rendered ineffective in pinning due to the absence of three dimensional collective elastic effects. A STRUCTURAL STUDY OF CHARGE-DENSITY-WAVE PERTURBATIONS IN MIXED-HALIDE MX SOLIDS
Brian Scott, Sabina R. Johnson, and Basil I. Swanson 1992 7 p Presented at the 1992 International Conference on Science and Technology of Synthetic Metals (ICSM), Goeteborg, Sweden, 12-18 Aug. 1992
(Contract W-7405-eng-36)
(DE93-005449; LA-UR-92-4030; CONF-9208132-9) Avail: CASI HC A02/MF A01

Mixed-halide crystals have been formed by co-crystallizing pure (Pt(en)2Cl2)(Pt(en)2)(ClO4)4(PtCl) and (Pt(en)2I2)(Pt(en)2)(ClO4)4(PtI), where en = 1,2 diaminoethane. Single crystal x-ray diffraction reveals that these crystals are of high quality. The pure PtI and PtCl contain chains of alternating Pt and halogen atoms that have undergone a Peierls distortion and commensurate charge disproportionation, resulting in alternating valence states on the platinum atoms: X-Pt(IV)-X---Pt(II)---X. The Peierls distortion results in a charge-density-wave (CDW), the strength of which is measured as the ratio, rho, of the short Pt(IV)-X bond distance to the long Pt(II)---X bond distance. PtCl is a strong CDW system with rho = 0.750 and PtI is a weak CDW system with rho = 0.919. The mixed-halide systems have the stoichiometry PtCl(1-x)I(x), with x = 0.1, 0.15, 0.2, 0.3, 0.7, 0.8, 0.85, and 0.90. A Chain lattice constant versus composition study strongly suggests distorted PtI and PtCl chains in these solids. A single crystal diffraction study on PtCl(0.85)I(0.15) shows significant perturbations in the PtCl and PtI chain CDW strengths, with the PtI segment showing no Peierls distortion (rho = 1). This control of the CDW strength, which is strongly tied to electron-electron and electron-phonon interactions in these solids, potentially allows tuning of electronic and optical properties on a nanometer scale. FAR-INFRARED AND RESONANCE RAMAN SPECTROSCOPY AND ISOTOPIC SUBSTITUTION STUDIES OF HALOGEN-BRIDGED PLATINUM CHAIN SOLIDS
S. P. Love, L. A. Worl, R. J. Donohoe, S. C. Huckett, S. R. Johnson, and B. I. Swanson 1992 5 p Presented at the 1992 International Conference on Science and Technology of Synthetic Metals, Goeteborg, Sweden, 12-18 Aug. 1992
(Contract W-7405-eng-36)
(DE93-005450; LA-UR-92-4029; CONF-9208132-12) Avail: CASI HC A01/MF A01

Here we review our most recent results on the vibrational spectroscopy of the MX chain solids (Pt(en)2)(Pt(en)2X2)(ClO4)4, (X = Cl, Br or I, and en = C2H8N2), referred to as PtX. Isotopic substitutions are used to clarify the nature of various vibrational modes. For Raman spectroscopy, fundamental phonon frequencies are determined, when possible, by excitation far below the band edge using a Ti:Sapphire laser, thus avoiding defect production, while photo-induced defects are studied specifically after intentional production. DOE

ELECTRON-PHONON DRIVEN SPIN FRUSTRATION IN MULTI-BAND HUBBARD MODELS: MX CHAINS AND OXIDE SUPERCONDUCTORS
J. T. Gammel (Naval Command, Control and Ocean Surveillance Center, San Diego, CA.), K. Yonemitsu, A. Saxena, A. R. Bishop, and H. Roeder (Bayreuth Univ., Germany.) 1992 7 p Presented at the 1992 International Conference on Science and Technology of Synthetic Metals (ICSM), Goeteborg, Sweden, 12-18 Aug. 1992
(Contract W-7405-eng-36)
(DE93-003697; LA-UR-92-3242; CONF-9208132-7) Avail: CASI HC A02/MF A01

The consequences of both electron-phonon and electron-electron couplings in 1-D and 2-D multi-band (Peierls-Hubbard) models are discussed. After a brief discussion of various analytic limits, focus is on (Hartree-Fock and exact) numerical studies in the intermediate regime for both couplings, where unusual spin-Peierls as well as long-period, frustrated ground states are found. Doping into such phases or near the phase boundaries can

lead to further interesting phenomena such as separation of spin and charge, a dopant-induced phase transition of the global (parent) phase, or real-space ('bipolaronic') pairing. Possible experimentally observable consequences of this rich phase diagram for halogen-bridged, transition metal, linear chain complexes (MX chains) in 1-D and the oxide superconductors in 2-D are discussed. DOE

GROWTH AND CHARACTERIZATION OF LASER-DEPOSITED SUPERCONDUCTING Bi-Sr-Ca-Cu-O THIN FILMS
P. J. Kung and R. E. Muenchausen 1992 23 p Presented at the 39th National Symposium of the American Vacuum Society, Chicago, IL, 9-13 Nov. 1992
(Contract W-7405-eng-36)
(DE93-003792; LA-UR-92-3526; CONF-921129-4) Avail: CASI HC A03/MF A01

Superconducting Bi-Sr-Ca-Cu-O thin films with thickness 400-3,500 A have been deposited on (100) MgO and (100) LaAlO3 by a pulsed excimer XeCl laser (gamma = 308 nm, tau = 20 ns, and energy density = 4-5 J/sq cm). Oxygen pressure during deposition and substrate temperature are 0.1-100 mTorr and 350-750 C, respectively. The as-deposited films were annealed either inside (in situ) or outside (ex situ) the deposition chamber to improve the crystallinity and the superconducting transition of the films. Formation of 2212 and 2223 phases was controlled by tailoring the deposition and annealing parameters. Corresponding (T(sub c))'s of these phases in the ex situ films measured by zero-field cooled diamagnetic transition at 10 Oe are 80 and 110 K; however, the in situ mirror-like shiny films with 2223 phase only exhibit (T(sub c)) = 81 K (or 98 K in an a.c. field of 0.1 Oe at 125 Hz). These films were also characterized by SEM, TEM, SQUID magnetometer, and AC susceptometer to study their morphology, microstructure, and magnetic properties. The critical magnetization current density (J(sub c)) of the ex situ films is of the order of 10(exp 7)-10(exp 8) A/sq cm and 10(exp 5)-10(exp 6) A/sq cm for H (perpendicular) c-axis and H (parallel) c-axis, respectively, at 7 K up to 5 T. The J(sub c) of the in situ films is two orders of magnitude lower than that of the ex situ films, and further enhancement of J(sub c) appears promising if better crystallinity of the in situ films can be achieved. A qualitative phase diagram with respect to the development of 2212 and 2223 phases are discussed. DOE

(DE93-006498; DOE/ER-45254/T1) Avail: CASI HC A02/MF A01

X-ray scattering was used to study thin films of C(60) on mica. Sodium intercalation into C(60) yields Na(x)C(60), with Na(6)C(60) retaining the fcc structure of undoped C(60). The fcc domain was extended up to x = 10. Metallic and superconducting donor-type intercalation compounds of C(60) are now well established; C(60)I(4) was obtained with no superconductivity above 4 K. Isothermal compressibility of K(3)C(60) and Rb(3)C(60) was measured and used to establish a universal first-order relation between (Tc) and lattice parameter a. Inelastic neutron scattering of inter- and intrachain dynamics of polyacetylene, polyaniline, and poly-parapheylene-vinylene reveal differences in the dominant thermal excitations. DOE

IN-SITU CHARACTERIZATION OF GROWTH AND INTERFACES IN a-Si:H DEVICES
R. W. Collins, C. R. Wronski, I. An, and Y. Li Dec. 1992 58 p Prepared for Midwest Research Inst., Golden, CO
(Contract DE-AC02-83CH-10093)
(DE93-000051; NREL/TP-451-5265) Avail: CASI HC A04/MF A01

This report describes the in-situ characterization of growth and interfaces in amorphous silicon (a-Si:H) devices. The growth of a-Si:H by plasma-enhanced chemical vapor deposition (PECVD) is complex and involves many gas-phase and solid-surface chemical and physical processes, which are influenced by charged particle bombardment, ultraviolet light exposure, etc. The research consisted of two broad components. The first involved preparing a-Si:H by 'optimum' PECVD and exposing the film to atomic hydrogen in-situ at the growth temperature. The processes of H-diffusion and incorporation in the exposed film were studied by spectroscopic ellipsometry, giving a picture of the processes by which the chemical potential in the film equilibrates with that in the gas phase. The properties of thin films were then prepared by alternating 'optimum' PECVD growth and hydrogen exposure. Film properties were then studied again. The second component of the research is discussed only briefly in this report, as it is an outgrowth of previous work on single-wavelength ellipsometry. With the new spectroscopic capability developed at Penn State, it is now possible to quantify the nucleation and growth process of a-Si:H films. DOE

COMPUTER SIMULATION OF THE ANOMALOUS ELASTIC BEHAVIOR OF THIN FILMS AND SUPERLATTICES
D. Wolf Oct. 1992 11 p Presented at the 2nd International Conference and Exhibition on Computer Applications to Materials and Molecular Science and Engineering, Yokohama, Japan, 22-25 Sep. 1992
(Contract W-31-109-eng-38)
(DE93-004154; ANL/MSD/CP-77907; CONF-920927-1) Avail: CASI HC A03/MF A01

Atomistic simulations are reviewed that elucidate the causes of the anomalous elastic behavior of thin films and superlattices (the so-called supermodulus effect). The investigation of free-standing thin films and of superlattices of grain boundaries shows that the supermodulus effect is not an electronic but a structural interface effect intricately connected with the local atomic disorder at the interfaces. The consequent predictions that (1) coherent strained-layer superlattices should show the smallest elastic anomalies and (2) the introduction of incoherency at the interfaces should enhance all anomalies are validated by simulations of dissimilar-material superlattices. DOE

SUBSTRATE SURFACE STRUCTURE EFFECTS ON MICROSTRUCTURE OF EPITAXIAL FILMS
J. Guo, H. L. M. Chang, H. Zhang, and D. J. Lam Dec. 1992 5 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract W-31-109-eng-38)
(DE93-005562; ANL/MSD/CP-76433; CONF-921101-56) Avail: CASI HC A01/MF A01

Microstructure of epitaxial thin films grown on sapphire substrates using the metal organic chemical vapor deposition technique were found to depend on the substrates surface structure. Epitaxial TiO2 films grown on the sapphire (0001) substrates were highly-oriented polycrystal and the films on the (1120) substrates were single crystal. First-principles total energy calculations were carried out to gain atomistic understandings of sapphire surface structures and their effects on microstructure of epitaxial films. The surface terminating atom planes were found to be Al atoms for the (0001) surface and O atoms for the (1120). Minimum step heights were one sixth of the lattice constant c for the (0001) and one half of the lattice constant a for the (1120). Steps of minimum height or its odd multiples on sapphire (0001) surface double the number of variants in the deposited films. The symmetry and step of the substrate surface and symmetry of the epitaxial growth plane controlled the microstructure of the epitaxial films. DOE

ION AND ELECTRON BEAM PROCESSING OF CONDENSED MOLECULAR SOLIDS TO FORM THIN FILMS
M. W. Ruckman, M. Strongin, J. K. Mowlem, J. F. Moore, and D. R. Strongin (State Univ. of New York, Stony Brook.) 1992 7 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC02-76CH-00016)
(DE93-007273; BNL-48419; CONF-921101-65) Avail: CASI HC A02/MF A01

Electron and ion beams can be used to deposit thin films and etch surfaces using gas phase precursors, However, the generation of undesirable

gas phase products and the diffusion of the reactive species beyond the region irradiated by the electron or ion beam can limit selectivity. In this paper, the feasibility of processing condensed precursors such as diborane, tri-methyl aluminum, ammonia and water at 78 K with low energy (100-1000 eV) electron and ion beams (Ar(+), N2(+) and H2(+)) ranging in current density from 50 nA to several micron a per cm(exp 2) is examined. It was found that boron, boron nitride and stoichiometric aluminum oxide films could be deposited from the condensed volatile; species using charged particle beams and some of the physical and chemical aspects and limitations of this new technique are discussed. DOE

The objective is to obtain a comprehensive understanding of structure and electronic properties of a-Si:H as they apply to solar cells. First observations were of light enhancement and field suppression of H diffusion in a-Si:H. Theoretical studies were made of hydrogen density of states distribution and its relation to defect metastability. Reduced density of light induced defect is observed in a-Si:H deposited in a remote hydrogen plasma reactor at 400 C. Kinetics of metastable defect creation using forward bias in a p-i-n diode to induce defects were studied and compared to light-induced defect creation in the same devices. Studies were made of transport at high electric field and low temperature. Detailed studies were made of the kinetics of dopant metastability in n-type and p-type a-Si:H. DOE

GROWTH AND OPTICAL CHARACTERIZATION OF ZnMnTe GROWN BY MOLECULAR BEAM EPITAXY
J. L. Reno, E. D. Jones, and E. L. Venturini 1992 7 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC04-76DP-00789)
(DE93-005350; SAND-92-2542C; CONF-921101-53) Avail: CASI HC A02/MF A01

We have successfully grown ZnMnTe alloys by molecular beam epitaxy using GaAs as a substrate. Bulk MnTe has the wurtzite crystal structure but the structural phase of the material was confirmed to be a zinc-blend by standard theta-2(theta) x-ray diffraction techniques. The composition was also determined using x-ray diffraction techniques. Manganese concentration was also estimated from magnetization measurements taken as a function of temperature. Magnetoluminescence studies were performed at 1.4K on the acceptor-bound exciton in the semimagnetic semiconductor ZnMnTe alloys. As expected, the photoluminescence peak energy decreased with increasing magnetic field. DOE

EPITAXIAL ZnS, ZnSe AND ZnS-ZnSe SUPERLATTICES GROWN ON (001)GaAs BY PULSED-LASER ABLATION
J. W. McCamy (Tennessee Univ., Knoxville.), D. H. Lowndes, J. D. Budai, G. E. Jellison, Jr., I. P. Herman, and S. Kim (Columbia Univ., New York, NY.) Nov. 1992 6 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-005420; CONF-921101-37) Avail: CASI HC A02/MF A01

Pulsed KrF (248 nm) laser ablation of polycrystalline ZnS and ZnSe targets was used to grow high quality, fully epitaxial ZnS and ZnSe thin films on (001) GaAs. Photoluminescence measurements of the ZnS thin films show strong edge emission, while ZnSe thin films show free excitonic as well as donor and acceptor peaks. By alternately ablating each target, strained layer superlattices of the form (ZnSe)(m)-(ZnS)(n) were grown with as many as 65 periods of compositional modulation. A ZnS(x)Se(1-x) structure also was fabricated which simultaneously incorporated both continuously graded and abrupt compositional changes. DOE

HIGH-TEMPERATURE Au IMPLANTATION INTO Ni-Be AND Ni-Si ALLOYS
M. R. James, N. Q. Lam, L. E. Rehn, P. M. Baldo, L. Funk, and J. F. Stubbins Dec. 1992 7 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract W-31-109-eng-38)
(DE93-005555; ANL/MSD/CP-76614; CONF-921101-40) Avail: CASI HC A02/MF A01

Effects of implantation temperature and target composition on depth distribution of implanted species were investigated. Au+ ions were implanted at 300 keV into polycrystalline Ni-Be and Ni-Si alloys between 25 and 700C to a dose of 10(exp 16) cm(exp -2). Depth distributions of Au were analyzed with RBS using He+ at both 1.7 and 3.0 MeV, and those of the other alloying elements by SIMS. Theoretical modeling of compositional redistribution during implantation at elevated temperatures was also carried out with the aid of a comprehensive kinetic model. The analysis indicated that below approximately 250C, the primary controlling processes were preferential sputtering and displacement mixing, while between 250 and 600C radiation-induced segregation was dominant. Above 600C, thermal-diffusion effects were most important. Fitting of model calculations to experimental measurements provided values for various defect migration and formation parameters. DOE

FABRICATION AND PROPERTIES OF Si3N4 WITH RARE EARTH APATITE GRAIN BOUNDARY PHASES
T. N. Tiegs, S. D. Nunn, K. L. Ploetz, P. A. Menchoffer, and C. A. Walls 1992 7 p Presented at the Materials Research Society Symposium, Boston, MA, 2-6 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-005752; CONF-921206-7) Avail: CASI HC A02/MF A01

The rare earth-oxide and nitride apatites were examined as grain boundary phases in silicon nitride to assess their potential for developing high toughness materials using gas-pressure-sintering. Densification was dependent on the quantity of additives used with high densities achieved at equivalent oxygen contents of approximately 8 percent. Fracture toughnesses (K(sub Ic)) up to 8-10 MPA sqr.m were obtained for some compositions. Ambient temperature flexural strengths were in the range of 400-720 MPa; however, the strengths at elevated temperatures (1200 C) were reduced from these values. DOE

SUPERCONDUCTIVITY AND FLUX PINNING IN Nd(1+x)Ba(2-x)Cu(3)O(7+DELTA)
S. I. Yoo, M. J. Kramer, and R. W. McCallum 24 Aug. 1992 4 p Presented at the Applied Superconductivity Conference, Chicago, IL, 23-28 Aug. 1992
(Contract W-7405-eng-82)
(DE93-004444; IS-M-732; CONF-920802-42) Avail: CASI HC A01/MF A01

The substitution of Nd(+3) for Ba(+2) in Nd(1+x)Ba-(2-x)Cu(3)O(7+(delta)) (Nd123ss) increases the occupation of O(5) sites. For x greater than 0.1 there is a significant depression of T(sub c) and for x less than 0.1 there is no substantial decrease T(sub c) within experimental error. T(sub c) vs x is characterized by two plateaus analogous T(sub c) vs delta in YBa(2)Cu(3)O(7-delta)(Y123). Analysis of oxygen contents of Nd123ss suggests the analogy with Y123 is valid. The transition width and Meissner fraction for all Nd123ss samples are strongly dependent on the sintering temperatures. While T(sub c) is not affected over the range 0 is less than x is less than 0.1, the oxygens surrounding the substituted Ba sites are expected to locally suppress the superconducting order parameter. Hysteresis measurements exhibited a small increase in the magnetic J(sub c), but flux creep measurements showed no apparent effects of the substitution on the flux pinning energy. DOE

MAGNETOTRANSPORT AND MAGNETOMETER STUDIES OF MAGNETIC THIN, SANDWICH AND MULTILAYER FILMS Ph.D. Thesis
Youjun Chen 1992 63 p
Avail: Univ. Microfilms Order No. DA9233975

Magnetotransport and magnetometer studies performed on single crystal thin Fe films grown on GaAs substrates by Molecular-Beam-Epitaxy method are described. In particular, the direct exchange interaction between the antiferromagnetic (AF) iron oxide on top of the Fe films and the underlying ferromagnetic (F) Fe is studied in detail. From the coupling strength, the iron oxide was identified as FeO. In addition to the epitaxial iron, an AF-F direct exchange interaction between Co and CoO was utilized to control the angle between the two Co layer magnetizations in Co/Cu/Co/CoO sputtered multilayer films. These samples were used to study the effect of antiparallel Co layer magnetizations on the anisotropic magnetoresistance (AMR). In addition to these samples, the effect of the antiparallel coupling between the Co layers on the AMR was also studied in Co/Cu coupled multilayer films. In both the few layers and multilayers, the phenomenon known as the giant magnetoresistance (GMR) was present. It is found that the GMR phenomenon has little effect on the AMR. This is apparently contrary to one class of the GMR models which utilizes the assumption of a near infinite spin flip scattering rate. An alternative two current explanation which doesn't require the near infinite spin flip scattering is presented.

TRANSPORT IN AMORPHOUS SEMICONDUCTORS Ph.D. Thesis
Mathieu Kemp 1992 113 p
Avail: Univ. Microfilms Order No. DA9234982

Four problems of the physics of amorphous semiconductor are analyzed: (1) The potential fluctuations induced by a dilute density of charges are shown to produce exponential band tailing. The effect of screening is analyzed and shown to also produce exponential tailing. The logarithmic slope of the exponential tail is derived and shown to be a function of lattice spacing, permittivity and screening length, but to be charge density independent. This mechanism is suggested to be at the origin of the exponential tails observed in amorphous semiconductors. Experiments are suggested to test this. (2) A model coupling band conduction with hopping is used to compute the drift mobility. A low temperature transition from band conduction to hopping is predicted. In a DOE constant near the band edge and exponential below (cutoff DOS), the mobility either saturates or rises at the transition; with values appropriate to a-Si:H, the model predicts a mobility saturation rather than a rise. In an exponential DOS, the drift mobility does not show this behavior. Comparison with drift mobility measurements in a-Si:H suggests the cutoff DOS to be a more appropriate density of states than the exponential. Further experiments are suggested to test this. (3) The effect of the coulombic pair interaction on low temperature geminate recombination is shown to introduce two kinds of recombination dynamics depending on the width of the DOS. When the width is small, diffusion is anisotropically biased toward the hole; when the width is large, isotropy is recovered. (4) The assumption that low temperature geminate recombination is reaction limited is shown to breakdown when the localization length is small. The resulting diffusion limited process is shown to (1) induce two peaks in the lifetime distribution; and (2) to be sensitive to the DOS. The excitation density is shown to induce a transition to non-geminate recombination and a lifetime reduction. Comparison with a-Si:H data gives support to recombination being a diffusion limited process and to the DOS being non-exponential.

PHYSICAL PROPERTIES OF ULTRATHIN FILMS OF HIGH-TEMPERATURE SUPERCONDUCTORS Ph.D. Thesis
Tiefei Wang 1992 133 p
Avail: Univ. Microfilms Order No. DA9239163

Electrical transport measurements were carried out on ultrathin films of high temperature superconductor at extremely low temperatures and in high magnetic fields. These films were fabricated by molecular-beam-epitaxy (MBE). Normal state Hall effect measurements were carried out on both ultrathin and thin films. The Hall number (R(sub H)(exp -1)) was a linear function of temperature in thin films and was less temperature dependent in ultrathin films. The Hall angle (cot theta(sub H)) on the other hand exhibited the same T2 dependence in both cases, in accordance with Anderson's Luttinger liquid phenomenology. When the transition temperature decreased to zero the Hall number decreased to a limiting value which corresponded approximately to one pair per coherence volume. The superconductor-insulator transition was studied both in zero magnetic field and in a finite magnetic field. The zero field transition was achieved either by considering a sequence of films of decreasing thicknesses, or by successive thermal cycling of a single film in vacuum. The critical resistance was found to be very close to universal constant h/4e(exp 2) (6.5 k-omega). This result supports the notion that the critical resistance in the superconductor-insulator transition in two dimensions is universal. Anomalous magnetoresistance was observed in films having resistances with values near that of zero-field superconductor-insulator transition. This unusual behavior may result from an interaction between carriers and antiferromagnetically ordered Cu2+ spins of the CuO2 planes. Upon application of a magnetic field three successive superconductor-insulator transitions were found. The first two at low critical fields appear to result from the film sheet resistance being modulated by the applied magnetic field, possibly by scattering of the carriers from reorienting spins. The third one may represent the new type of superconductor-insulator transition proposed by Fisher, in which a film goes from a vortex glass to an electron glass with increasing magnetic field. All three transitions could be scaled. Evidences for magnetic-field-enhanced superconductivity in ultrathin high-T(sub c) films are presented. The phenomena are interpreted as being due to a combination of film's reduced dimensionality and the anomalous magnetoresistance.

TIME-RESOLVED REFLECTIVITY STUDY OF SOLID-PHASE EPITAXIAL REGROWTH IN RELAXED AND STRAINED Si(1-x)Ge(x)
T. E. Hayes, C. Lee (Florida Univ., Gainesville.), and K. S. Jones (Florida Univ., Gainesville.) Nov. 1992 7 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-005154; CONF-921101-28) Avail: CASI HC A02/MF A01

The rate of solid-phase epitaxial regrowth was studied using time-resolved reflectivity in three different types of SiGe/Si epilayers amorphized by ion implantation. In two of these cases, the alloy epilayer contained either 12 percent or 20 percent Ge, and the amorphization depth was greater than the thickness (2000 A) of the SiGe alloy layer. Time-resolved reflectivity measurements showed that the rate of regrowth was not constant in these two cases, but first decreased after passing the SiGe/Si interface, and then increased. The minimum regrowth rate occurred closer to the SiGe/Si interface in the epilayers with the larger Ge atomic fraction. In the third type of sample, the alloy epilayer thickness was approximately 7 microns so that the initial epilayer (15 percent Ge) had the lattice constant of the bulk alloy. Furthermore, amorphization and regrowth occurred entirely within the relaxed alloy layer. In this case, the regrowth rate was constant. The composition dependence of the regrowth-rate transient in the strained layers is discussed in the context of a 'critical-thickness' model of strain relaxation.

NOVEL MATERIALS SYNTHESIS USING AN INTENSE PULSED ION BEAM
D. C. Gautier, R. E. Muenchausen, D. J. Rej, B. F. Roberts, W. J. Waganarr, and G. Johnston (New Mexico Univ., Albuquerque.) 1992 8 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract W-7405-eng-36)
(DE93-005470; LA-UR-92-4322; CONF-921101-54) Avail: CASI HC A02/MF A01

Initial experiments on evaporation from metallic and ceramic targets using a pulsed light ion beam source is reported. The source is an intense ion beam produced by a 1.2 MV, 300 kJ Anaconda generator fitted with an extraction diode. Beam fluences of 10-20 J/sq cm gives a deposition rate of about 30-50 nm per shot, for both brass and YBa2Cu3O(7-x) (1-2-3) targets. This is about 1000 times greater than comparable rates from pulsed laser deposition (PLD). Single-shot ablated 1-2-3 films, deposited on Si, were analyzed using RBS; the measured stoichiometry was close to 1-2-3 in favorable cases, but shot-to-shot reproducibility was poor. Approximately 1 percent of the available ion beam energy was utilized for these initial experiments. The potential for producing large area coatings from multi-cation targets and nanophase powders using pulsed ion beam deposition will be discussed.

The appropriate fluence of 2.0 MeV H(sup +) ions has been shown previously to enhance the critical current density J(sub c) by a factor of two at a magnetic field of 0.9 tes!a in 1000 (Angstrom) thick epitaxial films of YBa(2)Cu(3)O(7-delta) grown by the ex situ BaF2 process. The as-grown films exhibit single crystal-like behavior in both atomic ordering and J(sub c) versus temperature and magnetic field. TRIM simulations suggest that H(sup +) irradiation generates mainly point defects throughout the crystal structure. We show here that such defects produce both a large enhancement of J(sub c) for fields above 1 tesla and a significant increase in the apparent vortex pinning potential deduced from magnetization relaxation data. AN INVESTIGATION OF PROTEIN CRYSTAL GROWTH BY LASER LIGHT SCATTERING Ph.D. Thesis
John Bradford Bishop 1992 179 p
Avail: Univ. Microfilms Order No. DA9234723

Laser light scattering is utilized here to unobtrusively probe the sub-microscopic, macromolecular events within solutions from which protein crystals grow. Lysozyme and protamine insulin were studied. In this study the formation of a precrystalline aggregate is distinguished from that of an amorphous precipitant by photon correlation spectroscopy and by classical absolute scattering intensity measurements. A slight decrease in diffusion and a slight increase in intensity are shown to mark isothermal lysozyme nucleation. Light scattering is not typically done on supersaturated solutions, so before drawing conclusions, photon correlation with multiple scattering vectors (multi-q) was used to investigate interparticle interactions within 'monomeric' lysozyme solutions. The concentrations and temperature dependence of the effective hydrodynamic diameter of monomeric lysozyme were determined. In the supersaturated solutions the effective hydrodynamic diameter of the quasiequilibrium state is seen to vary with the degree of supersaturation. In the momomeric solutions the influence of hydrodynamic interactions is shown to predominate that of the thermodynamic interactions. It is concluded, that, although interparticle interactions affect the measurement of the effective diameter, small order aggregates are forming within the scattering volume during nucleation. Qualitative size distributions are presented, and scattering parameters for monitoring dynamically controlled lysozyme nucleation are offered. Dissert. Abstr.

QUANTUM MONTE CARLO SIMULATION ON HUBBARD MODEL FOR HIGH TEMPERATURE SUPERCONDUCTIVITY Ph.D. Thesis
Aniket Bhattacharya 1992 177 p
Avail: Univ. Microfilms Order No. DA9234527

An extended Hubbard model on a copper-oxygen lattice in two dimension has gained considerable attention in the context of high temperature superconductivity. In this dissertation various properties of this model Hamiltonian have been explored using both the finite temperature path integral Monte Carlo and the Gutzwiller Variational Monte Carlo methods. Antiferromagnetism appears to occur at half-filling when oxygen-p level and copper-d level have substantial different energies. The dependence of the variational parameters on the Hamiltonian parameters are discussed. It is also shown that a simplified model keeping only the Coulomb correlation on the copper sites retains antiferromagnetism at half-filling with correct local moment and distribution of holes on copper and oxygen sites. The simulations for a small cluster indicate the possibility of extended s-wave and d-wave pairing in the extended Hubbard model. Motivated by the earlier work on flux-phases as possible ground states for the t-J model, which can be derived as a large-U limit of a single band Hubbard model, these flux phase states are studied for a single band Hubbard model using Gutzwiller's variational ansatz. Contrary to the previous results for the t-J model, the ground state of the Hubbard model is found to be always paramagnetic or antiferromagnetic. Near half-filling the t-J model with no double occupancy is dominated by magnetic energy, while Hubbard model with partial double occupancy is dominated by kinetic energy. When flux-phases are introduced into the Hubbard model, the decrease in magnetic energy is not enough to compensate the cost of kinetic energy increment. Dissert. Abstr.

LOW-TEMPERATURE SPECIFIC HEAT OF SEVERAL HIGH-TEMPERATURE SUPERCONDUCTORS IN THE SUPERCONDUCTING AND MIXED STATES Ph.D. Thesis
Steven Elliot Stupp 1992 165 p
Avail: Univ. Microfilms Order No. DA9236601

The low-temperature specific heat of high quality, well characterized sintered polycrystalline samples of superconducting Ba(0.6)K(0.4)BiO(3), YBa(2)Cu(3)O(6.7), and Bi(2)Sr(2)CaCu(2)O(8+x) were measured in the superconducting state. Careful analysis of the data below 10 K indicate that the contribution to the specific heat which has a linear dependence on temperature, which has been observed in samples of YBa(2)Cu(3)O(7-delta), is not a universal feature of the high temperature superconductors. We observed that the linear term in YBa(2)Cu(3)O(7-delta) is weakly dependent on the oxygen content, delta. We argue that a linear term of 4 mJ/mole K2 is intrinsic to this compound, and while the origin of this linear term is still unknown it does not appear to be associated with the superconducting state. The low-temperature specific heat of the Bi(2)Sr(2)CaCu(2)O(8+x) samples were also measured in the mixed state in applied magnetic fields up to 3T. A strong field dependence in the specific heat was observed in the YBa(2)Cu(3)O(6.7) sample, while the specific heat of Bi(2)Sr(2)CaCu(2)O(8+x) was independent of field. The presence of a large field dependence at low-temperatures in the mixed state is not in agreement with the predictions of London theory. We mention several possible explanations for the large field dependence of the specific heat, including novel vortex structures, vortex kink nucleation, vortex core interactions, proximity effect coupling, and nodes in the superconducting gap. Dissert. Abstr.

PROCESS TOWARD A COMPREHENSIVE CONTROL SYSTEM FOR MOLECULAR BEAM EPITAXY Interim Report, 1 Aug. 1990 - 30 Jul. 1992
Oliver D. Patterson, Jeffrey J. Heyob, Steven J. Adams, Victor Hunt, and Patrick H. Garrett Aug. 1992 19 p
(AD-A259724; WL-TR-92-4091) Avail: CASI HC A03/MF A01

A hierarchical control system for improving the manufacturing capability of the thin-film semiconductor growth process, Molecular Beam Epitaxy, is under development at the Air Force Materials Directorate. The focus of the first level is to improve the precision and tracking of the variables, flux, and substrate temperature. The second level consists of an expert system that uses sensors to monitor the status of the product in order to generate a process plan in real time. The third level features a continuously evolving neural network model of the process which is used to recommend the recipe and command inputs to achieve a desired product goal. All three levels require models of the process which are updated using automatic process identification experiments. The three levels of the system are described and experimental data is used to illustrate the impact of select modules. GRA

(AD-A259729) Avail: CASI HC A01/MF A01

The effect of molecular orientation on the transverse mechanical properties of poly(p-phenylene-2,6 benzobisoxazole) (PBO) and poly(2,5-benzoxazole) (ABPBO) were studied. ABPBO and PBO chains were prepared with radially shaped chain orientations with respect to the anthrone nucleus. The inherent viscosity of the ABPBO in methene-sulfonic acid at 20 C was 0.98 dL/g. The C-13 FT NMR spectrum of the star-like polymer showed a chemical shift at 75.0 ppm (relative to TMS) corresponding to the quaternary carbon in the 9-position of the anthrone ring. GRA

MACROSCOPIC MODELS OF SUPERCONDUCTIVITY Ph.D. Thesis
S. J. Chapman 1991 275 p
Avail: Univ. Microfilms Order No. BRD-97291

After giving a description of the basic physical phenomena to be modelled, we begin by formulating a sharp-interface free-boundary model for the destruction of superconductivity by an applied magnetic field, under isothermal and anisothermal conditions, which takes the form of a vectorial Stefan model similar to the classical scalar Stefan model of solid/liquid phase transitions and identical in certain two-dimensional situations. This model is found sometimes to have instabilities similar to those of the classical Stefan model. We then describe the Ginzburg-Landau theory of superconductivity, in which the sharp interface is 'smoothed out' by the introduction of an order parameter, representing the number of density of superconducting electrons. By performing a formal asymptotic analysis of this model as various parameters in it tend to zero we find that the leading order solution does indeed satisfy the vectorial Stefan model. However, at the next order we find the emergence of terms analogous to those of 'surface tension' and 'kinetic undercooling' in the scalar Stefan model. Moreover, the 'surface energy' of a normal/superconducting interface is found to take both positive and negative values, defining Type 1 and Type 2 superconductors respectively. We discuss the response of superconductors to external influences by considering the nucleation of superconductivity with decreasing magnetic field and with decreasing temperature respectively, and find there to be a pitchfork bifurcation to a superconducting state which is subcritical for Type 1 superconductors and supercritical for Type 2 superconductors. We also examine the effects of boundaries on the nucleation field, and describe in more detail the nature of the superconducting solution in Type 2 superconductors - the so-called 'mixed state'. Finally, we present some open questions concerning both the modelling and analysis of superconductors. Dissert. Abstr.

(DE93-000071; NREL/TP-411-5326) Avail: CASI HC A03/MF A01

This report describes an apparatus, constructed and tested, that allows measurement of the surface morphology of as-grown hydrogenated amorphous silicon films with atomic resolution using a scanning tunneling microscope. Surface topologies of 100-degree lambda-thick intrinsic films, deposited on atomically flat, crystalline Si and GaAs, are reported. These film surfaces are relatively flat on the atomic scale, indicating fairly homogeneous, compact initial film growth. The effect of probe-tip size on the observed topology and the development of atomically sharp probes is discussed. DOE

A SOLID STATE APPROACH TO THE PRODUCTION OF KILOGRAM QUANTITIES OF Si80Ge20 THERMOELECTRIC ALLOYS
B. A. Cook, J. L. Harringa, and B. J. Beaudry 1992 8 p Presented at the 10th Symposium on Space Nuclear Power and Propulsion, Albuquerque, NM, 10-14 Jan. 1993
(Contract W-7405-eng-82)
(DE93-004476; IS-M-734; CONF-930103-28) Avail: CASI HC A02/MF A01

An important consideration in the development of improved materials for thermal-to-electrical power generation is whether a research-scale process or methodology is amenable to production of kilogram quantities. Research efforts on the solid state technique of mechanical alloying have shown that both n- and p-type Si-20 at. percent Ge alloys can be produced which have improved thermoelectric properties compared to state-of-the-art MOD-RTG materials. Studies on the production of large quantities of mechanically alloyed powder alloys using a planetary mill indicate that properties similar to those observed in alloys prepared in smaller quantities by a vibratory mill can be obtained. The characterization of several p-type alloys doped with 0.8 at. percent B in the form SiB4 by X-ray diffraction, scanning laser mass spectroscopy, Hall effect, and high temperature electrical resistivity and Seebeck coefficient measurements are described. The transport properties of these alloys are shown to be comparable to those measured on similar samples prepared in small quantities by a research-grade vibratory mill. DOE

ACCURATE EVALUATION OF THE REAL AND IMAGINARY MATERIAL CONSTANTS FOR A PIEZOELECTRIC RESONATOR IN THE RADIAL MODE
S. Sherrit, N. Gauthier, H. D. Wiederick, and B. K. Mukherjee Jul. 1991 32 p
(Contract DREA-046)
(DREA-CR-91-451; CTN-93-60692) Avail: CASI HC A03/MF A01

The standard IEEE procedure for determining the piezoelectric, dielectric, and elastic constants associated with the radial mode resonance of piezoelectric materials neglects the imaginary components of these constants. A method is presented to determine the complex form of the above constants. These constants are calculated from the experimental values of the first and second series resonant frequencies, the first parallel resonance frequency and appropriate half band frequencies, and the low frequency admittance of the material, all of which can be measured on one disk sample. The method was also used to automate the current IEEE procedure for determining the real parts of the material constants. The method was applied to three test cases to test the limitations of the fit. The technique is limited at very high and low quality factors. The technique was also applied to a lead zirconate titanate sample, and the results and fit were found to be in excellent agreement. Author (CISTI)

RECRYSTALLIZATION OF AMORPHOUS AND NANOCRYSTALLINE NdBa2Cu3O(7-x) AND GdBa2Cu3O(7-x)
T. J. Folkerts (Iowa State Univ. of Science and Technology, Ames.), K. W. Dennis, S. I. Yoo, and Y. Xu 1992 4 p Presented at the Applied Superconductivity Conference, Chicago, IL, 23-28 Aug. 1992
(Contracts W-7405-eng-82; DE-FG02-90ER-45427)
(DE93-004469; IS-M-722; CONF-920802-47) Avail: CASI HC A01/MF A01

Using a melt-spinning technique, both amorphous and nanocrystalline

NdBa2Cu3O(7-x) and GdBa2Cu3O(7-x) materials were produced. Samples melt-spun in O2 consist of nanocrystals with the tetragonal 123 structure while those processed in N2 show an amorphous matrix with small amounts of crystalline BaCu2O2, as shown by x ray diffraction (XRD) and transmission electron microscopy (TEM) studies. The difference is due to the strong dependence of the phase relations on the O2 partial pressure. Superconductivity can be fully restored by heating above 1000 C followed by a 450 C anneal in O2. High temperature XRD studies show that the 123 phase crystallizes directly from the amorphous matrix below 800 C. Poor superconducting properties for samples heated below 1000 C are attributed to disorders on the heavy metal sites. DOE

MAGNETIC ANISOTROPY IN THE HIGH TRANSITION TEMPERATURE SUPERCONDUCTOR YBa2Cu3O(7-DELTA) Ph.D. Thesis
Ado Umezawa 1991 214 p
Avail: Univ. Microfilms Order No. DANN70028

The strong anisotropy found in the electronic structure of YBa2Cu3O(7-delta) resulting from the existence of both the CuO2 planes within the a,b place and the CuO chains along the b axis has brought strong interest regarding the effect of the electronic structure anisotropy on the superconducting properties in this material. Such superconducting properties include both the intrinsic type (such as H(sub c1), H(sub c2), H(sub c), lambda, xi...) and the non-intrinsic type (such as flux pinning and j(sub c)). The availability of twinned and more recently, untwinned single crystals of YBa2Cu3O(7-delta) has made it possible for such anisotropic properties to be investigated. Magnetization critical current (j(sub c)) were measured for H//C and H//a,b in order to investigate the characteristics of flux pinning. The temperature dependence of j(sub c) was measured up to 77 K to determine the viability of the material for application use at such high temperatures. Irradiation of the single crystals with high energy neutrons is also done to investigate the possibility of using such a method for increasing j(sub c). Intrinsic superconducting parameters are investigated by measuring the magnitude and anisotropy of the lower critical field H(sub c1) and comparing it to the measurements of the upper critical field H(sub c2). From these values the magnitude and anisotropy of the other characteristic values such as lambda, kappa and H(sub c) are estimated using an anisotropic Ginzburg-Landau model. The temperature dependence of H(sub c1) was found to give unusual results, which differed with the direct temperature dependent measurements of the magnetic penetration depth lambda. The lower critical field was measured on an untwinned single crystal of YBa2Cu3O(7-delta) to investigate both the a-b anisotropy and the effects of the twin boundaries on the measurements of H(sub c1). Dissert. Abstr.

NEUTRON MEASUREMENTS OF THE VORTEX LATTICE IN YBa2Cu3O7
H. A. Mook, M. Yethiraj, G. D. Wignall, E. M. Forgan, S. L. Lee, R. Cubitt (Birmingham Univ., England.), D. McK. Paul (Warwick Univ., Coventry, England.), and T. Armstrong (Allied-Signal Corp., Torrance, CA.) 1992 22 p Presented at the Conference on Magnetism and Magnetic Materials, Houston, TX, 1-4 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-005417; CONF-921201-13) Avail: CASI HC A03/MF A01

Neutron diffraction has been used to measure the vortex lattice scattering for YBa2Cu3O7. A square pattern is found when the field is applied along the c axis, while a triangular pattern is found when the field is applied well away from the c axis. High-resolution measurements for the square pattern show that the vortex lattice has long-range orientational order but only short-range positional order. The temperature dependence of the penetration depth is not that expected for a superconductor with a conventional s-wave BCS type gap. Preliminary measurements for temperatures near the irreversibility line are consistent with the occurrence of melting of the vortex lattice or glass phase. DOE

CAVITIES IN He-IMPLANTED Si: INTERNAL SURFACE SCIENCE
D. M. Follstaedt, S. M. Myers, and H. J. Stein 1992 7 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC04-76DP-00789)
(DE93-005340; SAND-92-1367C; CONF-921101-64) Avail: CASI HC A02/MF A01

The concept of using internal cavities in semiconductors for surface studies is presented. The microstructures of He-implanted (001) Si are characterized with zone axes (110) cross-section TEM, which shows that internal areas 5-7 times that of the specimen front surface are achieved with 1 x 10(exp 17) He/sq cm implanted at 30 keV and annealed at 700 or 800 C. Examples using internal cavities to determine surface bond strengths of other elements adsorbed on Si are indicated. Facets on the cavities are used to examine the equilibrium crystal shape of Si and to measure the ratios of the surface free energies of the observed planes. The /111/ planes have the lowest energy, and those of /001/ and /110/ are 1.09(7) and 1.07(3) times higher, respectively. We also find cavities in He-implanted Ge after annealing that can be used for similar studies. DOE

SPECTROSCOPIC ELLIPSOMETRY AND INTERFERENCE REFLECTOMETRY MEASUREMENTS OF CVD SILICON GROWN ON OXIDIZED SILICON
G. E. Jellison, Jr., M. Keefer (Prometrix Corp., Santa Clara, CA.), and L. Thornquist (Prometrix Corp., Santa Clara, CA.) Nov. 1992 7 p Presented at the Materials Research Society Meeting, Pittsburgh, PA, 3 Nov. - 4 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-005767; CONF-9211127-2) Avail: CASI HC A02/MF A01

Several samples of thin-film silicon grown on oxidized Si, both oxidized and unoxidized, have been examined using spectroscopic ellipsometry (SE) and constunt angle reflection interference spectroscopy (CARIS). The SE data was fit to 5- or 6-layer models of the sample near surface region, using the optical functions of thin-film silicon determined from a previous work. Reasonable fits were obtained from samples containing amorphous Si(a-Si) or large-grain polycrystalline Si(p-Si), but fits to samples containing small-grain, undoped p-Si were poor unless a 8-15 nm surface roughness layer is included. Furthermore, the optical functions of p-Si:ud are not consistent from sample to sample. The optical functions determined from SE measurements were then used to interpret CARIS measurements, extracting the thicknesses of the films, which are then compared with the thicknesses obtained from SE. SILICON NITRIDE CONTAINING RARE EARTH SILICATE INTERGRANULAR PHASES
S. D. Nunn, T. N. Tiegs, K. A. Ploetz, C. A. Walls, and N. Bell 1992 6 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-006624; CONF-921101-81) Avail: CASI HC A02/MF A01

Si3N4 ceramics prepared with refractory grain boundary phases to improve high temperature properties are difficult to density by conventional sintering methods. Gas-pressure sintering may be used to promote densification and development of acicular grains for improved fracture toughness. The current study examined rare earth silicate sintering aids with the composition M2Si2O7, where M is a trivalent cation (Y, La, Nd). M2O3 and SiO2 additions were varied to develop a number of compositions

in the Si3N4-Si2N2O-M2Si2O7 ternary phase field. Pressureless sintering and gas-pressure sintering were used to densify the samples. Densification, microstructure development, oxidation resistance, and mechanical properties were evaluated and compared with respect to compositional variations and processing conditions. DOE

Thin films of GaN and Al(x)Ga(1-x)N have been deposited by modified gas source MBE on alpha(6H)SiC(0001) and sapphire(0001). The values of x ranged from 0 to 1 in intervals of 0.2, as determined scanning Auger spectrometry. Simple UV photo detectors were produced and tested. The gains in the detectors was 10-20 at a bias voltage of 5 volts. The photocurrents for the solid solution detectors were much larger than for the pure GaN. Intrinsic, Mg p-type and Si n-type doped GaN films have also been achieved during growth. GaN thin films have also been achieved via atomic layer epitaxy on SiC substrates from triethy gallium and ammonia. Additional efforts have been channeled to develop luminescence facilities operative in the blue-UV wavelength range, ion implantation and contact studies and reactive ion etching facilities for GaN and AlN studies. Isotopically enriched Ge-70 and Ge-74 single crystals were successfully grown by a newly developed vertical Bridgman method. The system allows us to reliably grow high purity Ge single crystals of approximately 1 cu cm volume. To our knowledge, we have grown the first Ge-70 single crystal. The electrically active chemical impurity concentration for both crystals was found to be approximately 2 x 10(exp 12) cm(exp -3) which is two orders of magnitude better than that of Ge-74 crystals previously grown by two different groups. Isotopic enrichment of the Ge-70 and the Ge-74 crystals is 96.3 percent and 96.8 percent, respectively. The residual chemical impurities present in both crystals were identified as phosphorus, copper, aluminum, and indium. A wide variety of experiments which take advantage of the isotopic purity of our crystals are discussed. DOE

HEXAGONAL FERRITES FOR MILLIMETER WAVE APPLICATIONS Final Report
Donald E. Polk and Kristl B. Hathaway 7 Jan. 1993 8 p
(Contract N00014-87-K-0325)
(AD-A260483) Avail: CASI HC A02/MF A01

A review of the work accomplished on this contract is presented. A review of the physics of hexagonal ferrite materials and the effective linewidth concept and the detailed overall research plan are contained in the original proposal document. The focus of the program was on the effective linewidth in millimeter wave materials, including planar hexagonal ferrite Y-type materials, uniaxial M-type materials, and thin ferromagnetic transition metal and alloy films. The key idea in the original proposal was that the ferromagnetic resonance (FMR) linewidth in hexagonal ferrites is dominated by inhomogeneous and two-magnon scattering losses and that off-resonance measurements of the effective linewidth would (1) show that the FMR losses do not represent the intrinsic losses, and (2) that the intrinsic losses are significantly lower. This basic idea was verified. Results were obtained on the off-resonance far-field effective linewidth in planar Zn-Y hexagonal ferrite single crystal platelets, single crystal spheres of Ba- and Sr-hexaferrite materials, and permalloy thin films. Three papers on these results were published. GRA

THE IN SITU OBSERVATION OF EPITAXIAL DIAMOND THIN FILM NUCLEATION AND GROWTH USING EMISSION ELECTRON MICROSCOPY Semiannual Report, 1 Apr. - 31 Dec. 1992
Martin E. Kordesch Dec. 1992 27 p
(Contract N00014-91-J-1596)
(AD-A259616) Avail: CASI HC A03/MF A01

A miniature gas dosing apparatus for low pressure (10(exp -4)) Torr diamond growth was tested: photoelectron microscope images were acquired under deposition conditions, and alteration in the image due to atomic hydrogen impact/reaction were observed. Diamond growth on polycrystalline films was not verified since incremental growth at the low rate expected will be difficult to detect on a rough substrate. Growth test on Mo(100) and (310) are underway. In situ etching of diamond in oxygen showned that diamonds are embedded in a Mo-carbide layer which remains after etching. The pits left after etching indicate nucleation on Mo, not Mo-carbide. The observation of ordered carbon films deposition from a methane/atomic hydrogen gas stream directed at a Mo(100) single crystal surface in situ at 1000 K continues. Attempts at creating nucleation sites to specifically enhance two dimensional growth were partially successful. For epitaxial systems, the LEED microscope, which uses diffraction contrast to form an image, will be used to study in situ steps and ledges engineered to match the diamond lattice. Diamond (100) LEED patterns and H2 desorption were observed. Si(310) wafers, Mo(310), and C(310) are currently being characterized. GRA

Progress continued in 1992 in the two major areas of the diamond program; diamond consolidation, and heteroepitaxial nucleation. A consolidation technology is being developed as one approach to large area diamond single crystals. During this phase of the program, techniques were developed for (1) bonding of natural diamond seed crystals to non-diamond substrates; (2) overgrowth for consolidation; and (3) ion-implantation for lift-off of thin diamond platelets. Experimental and theoretical progress was also made on heteroepitaxial growth of diamond. Theoretical modeling indicated a possible role of subsurface carbon in Ni(111) in preventing diamond nucleation. Experimental studies provided evidence for several roles for oxygen on diamond surfaces during diamond growth. Progress was also made in developing techniques for microstructural characterization of chemical vapor deposition (CVD) diamond. Transmission electron microscopy (TEM) sample preparation methods were developed for cross-sectional and plan-view analysis of diamond films and substrates. A simple method for rapidly assessing defect densities in CVD and natural diamond was also developed. GRA

MILLIMETER-WAVE APPLICATIONS OF SEMICONDUCTOR DIELECTRIC WAVEGUIDES WITH PLASMA LAYERS (SURFACE OR BURIED) GENERATED FROM SEMICONDUCTOR LASERS Final Report, Dec. 1988 - Sep. 1992
Jerome K. Butler Sep. 1992 73 p
(Contract DAAL03-89-K-0029)
(AD-A260484; ARO-25339.5-EL) Avail: CASI HC A04/MF A01

This research program was aimed at the theoretical and experimental investigations of semiconductor devices and waveguides with applications in millimeter wave systems. The major components considered included waveguide phase shifters, attenuators, and periodic structures designed to operate at the Second Bragg frequency. Most of the effort was directed at

theoretical and experimental understanding of the second-order Bragg structures since these components produce the most efficient radiating antennas. With a goal of locking several independent oscillators through gratings in the dielectric waveguide, the grating plays one of the most important roles in the system integration. Accordingly, two comprehensive computer models of dielectric gratings were developed and experimental measurements were made on more than fifty waveguide structures. GRA

COUPLED STRUCTURAL, THERMAL, PHASE-CHANGE AND ELECTROMAGNETIC ANALYSIS FOR SUPERCONDUCTORS, VOLUME 1 Final Report, Sep. 1988 - Mar. 1993

Carlos A. Felippa, Charbel Farhat, K. C. Park, Carmelo Militello, and James J. Schuler Mar. 1993 317 p

(Grant NAG3-934)

(NASA-CR-192697; NAS 1.26:192697; CU-CSSC-93-06-1) Avail: CASI HC A14/MF A03

This research program has dealt with the theoretical development and computer implementation of reliable and efficient methods for the analysis of coupled mechanical problems that involve the interaction of mechanical, thermal, phase-change and electromagnetic subproblems. The focus application has been the modeling of superconductivity and associated quantum-state phase-change phenomena. In support of this objective the work has addressed the following issues: (1) development of variational principles for finite elements; (2) finite element modeling of the electromagnetic problem; (3) coupling of thermal and mechanical effects; and (4) computer implementation and solution of the superconductivity transition problem. The research was carried out over the period September 1988 through March 1993. The main accomplishments have been: (1) the development of the theory of parametrized and gauged variational principles; (2) the application of those principled to the construction of electromagnetic, thermal and mechanical finite elements; and (3) the coupling of electromagnetic finite elements with thermal and superconducting effects; and (4) the first detailed finite element simulations of bulk superconductors, in particular the Meissner effect and the nature of the normal conducting boundary layer. The grant has fully supported the thesis work of one doctoral student (James Schuler, who started on January 1989 and completed on January 1993), and partly supported another thesis (Carmelo Militello, who started graduate work on January 1988 completing on August 1991). Twenty-three publications have acknowledged full or part support from this grant, with 16 having appeared in archival journals and 3 in edited books or proceedings. Author

COUPLED STRUCTURAL, THERMAL, PHASE-CHANGE AND ELECTROMAGNETIC ANALYSIS FOR SUPERCONDUCTORS, VOLUME 2

Carlos A. Felippa, Charbel Farhat, K. C. Park, Carmelo Militello, and James J. Schuler Mar. 1993 291 p

(Grant NAG3-934)

(NASA-CR-192698; NAS 1.26:192698; CU-CSSC-93-06-2) Avail: CASI HC A13/MF A03

Two families of parametrized mixed variational principles for linear electromagnetodynamics are constructed. The first family is applicable when the current density distribution is known a priori. Its six independent fields are magnetic intensity and flux density, magnetic potential, electric intensity and flux density and electric potential. Through appropriate specialization of parameters the first principle reduces to more conventional principles proposed in the literature. The second family is appropriate when the current density distribution and a conjugate Lagrange multiplier field are adjoined, giving a total of eight independently varied fields. In this case it is shown that a conventional variational principle exists only in the time-independent (static) case. Several static functionals with reduced number of varied fields are presented. The application of one of these principles to construct finite elements with current prediction capabilities is illustrated with a numerical example. Author

OPTICAL STUDIES OF LATERALLY CONFINED QUANTUM WELL STRUCTURES GROWN ON EX-SITU AND IN-SITU PATTERNED SUBSTRATES Final Technical Report, 18 Sep. 1989 - 17 Sep. 1992

Anupam Madhukar 29 Dec. 1992 31 p

(Contract DAAL03-89-K-0170)

(AD-A260275; ARO-27298.1-EL) Avail: CASI HC A03/MF A01

The issues examined are summarized and the findings are related to (1) absorption and electroabsorption behavior of strained GaAs/InGaAs multiple quantum wells (MQW), (2) the dc transport characteristics of strained GaAs/InGaAs/AlAs based resonant tunnelling diodes, and (3) realization of three-dimensionally confined quantum well structures on patterned GaAs(111)B substrates via a one-step growth process labelled substrate encoded sized reducing epitaxy (SESRE). Use of pre-patterned substrates as a means of strain relief without the generation of dislocations is shown to allow growth of high quality MQW's to thicknesses of approximately 1 micron needed for sufficient optical interaction path length in p-i(MQW)-n modulators and detectors. The role of defect induced deep levels in impacting the exciton linewidth through their influence on the internal field distribution is revealed for the first time. Three dimensionally confined GaAs/AlGaAs structures are realized for the first time using SESRE. GRA

STUDY OF THE MODEL OF HOLE SUPERCONDUCTIVITY IN MULTIPLE BAND CASES AND ITS APPLICATION TO TRANSITION METALS Ph.D. Thesis

Xue Qi Hong 1992 137 p

Avail: Univ. Microfilms Order No. DA9227863

We began our investigation by studying a simple model consisting of a chain of atoms with two atoms per unit cell. This model develops two bands when the inter-cell and intra-cell hopping amplitudes are different. We have found that superconductivity predominantly occurs when the Fermi level is close to the top of the upper band where the wavefunction has antibonding feature both inside the unit cell and between unit cells. Superconductivity occurs only in a restricted parameter range when the Fermi level is close to the top of the lower band because of the repulsive interaction within the unit cell. We find that pair expectation values that 'mix' carriers of both bands can exist when interband interactions other than V12 of Suhl et al are present. But the magnitude of the 'mixed pairs' order parameters is much smaller than that of the intra-band pairs. The V12 of Suhl et al is the most important interband interaction that gives rise to the main features of a two-band model: a single transition temperature and two different gaps. We have used the model of hole superconductivity to study the variation of T(sub c) among transition metal series--the Matthias rules. We have found that the observed T(sub c)'s are consistent with superconductivity of a metal with multiple bands at the Fermi level being caused by the single band with strongest antibonding character at the Fermi level. When the Fermi level is the lower part of a band, there is no T(sub c). As the band is gradually filled, T(sub c) rises, passes through a maximum, then drops to zero when the band is full. This characteristic feature is independent of any fine structure of the band. The position of the peak and the width of the peak are correlated. Quantitative agreement with the experimental results is obtained by choosing parameters of onsite Coulomb interaction U, modulated hopping term Delta-t, and nearest neighbor

repulsion V to fit the magnitude of T(sub c) and the positions of experimental peaks. Rigid band approximation is used for regions of different crystal structure. Dissert. Abstr.

GAS SOURCE MOLECULAR BEAM EPITAXIAL GROWTH OF GaN Final Report, 1 Aug. 1989 - 15 Sep. 1990
Duncan W. Brown 25 Nov. 1992 34 p
(Contract DAAL03-89-C-0023)
(AD-A260524; ARO-27320.1-EL-SBI) Avail: CASI HC A03/MF A01

Aluminum gallium nitride (AlGaN) has long been recognized as a promising radiation hard optoelectronic material. AlGaN has a wide direct band gap and therefore has potential applications in the fabrication of short wave-length devices, e.g., detectors and light-emitting diodes in the visible to ultraviolet region. Additionally, its piezoelectric properties and high acoustic velocities make it attractive for acoustic devices. The technical objective in Phase 1 was to determine if low temperature sources based on covalently bonded Group 3-nitrogen compounds could be used to prepare AlGaN films by gas source molecular beam epitaxy. The program required to investigate low temperature AlGaN source materials was separated into two parts: (1) the synthesis, purification, and pyrolysis of gallium-nitrogen adducts and aluminum-nitrogen adducts; and (2) the growth of GaN by chemical beam epitaxy. We clearly demonstrated under CBE conditions GaN(x)C(y) films could be grown using compounds with pre-existing Ga-N bonds whereas no films were formed using trimethylgallium. Dimethylgallium amide was shown to produce dramatically lower carbon content films in the presence of ammonia than did trimethylgallium in the presence of ammonia. GRA

HETEROEPITAXIAL GROWTH OF GALLIUM NITRIDE AND NATIVE DEFECT FORMATION IN III-V NITRIDES Ph.D. Thesis
Ting Lei 1993 149 p
Avail: Univ. Microfilms Order No. DA9233214

ECR-MBE was developed as a new method for the growth of GaN films. In this method, the film growth proceeds by the reaction of Ga vapor with ECR-activated molecular nitrogen at relatively low temperatures, which allow the growth of stoichiometric GaN films. In addition, the ultrahigh vacuum environment reduces the incorporation of unwanted impurities. To control nucleation and initial growth, a new growth process has been developed, in which a GaN buffer layer is grown first at relatively low temperatures, where the growth is dominated by kinetics. The growth of the rest of the film proceeds at elevated temperatures, where the growth is dominated by thermodynamics. This deposition method was found to lead to a quasi-layer-by-layer growth with a lateral growth rate 100 times faster than the vertical one. The surface roughness of the film was found to be less than 100 A. Epitaxial single crystalline GaN films were grown for the first time in Si(001) and (111) substrates, using this two-step process. The GaN films on Si(001) are single crystalline, and epitaxially stabilized in the metastable zincblende structure. The GaN films on Si(111) were grown in the wurtzite structure, and were found to have a considerable number of stacking faults along the (0002) direction, which gives rise to a significant zincblende component with (111) orientation. Heteroepitaxial GaN films were also grown on more widely used a-plane and r-plane sapphire substrates using this two-step growth process. The structure, microstructure and epitaxial relationship to the substrate of GaN films were investigated by RHEED, X-ray diffraction and electron microscopy. Stacking faults have been identified for the first time as one of the dominant structural faults in GaN films with (0002) orientation. Electrical properties of GaN films were investigated and a new transport mechanism involving two conduction paths were proposed. Optical properties were studied by absorption measurement and cathodoluminescence. Ab-initio quantum total energy calculations were performed to study the formation of the native defects in GaN and BN. Preliminary results on the wurtzite GaN confirm that nitrogen vacancies are the dominant native point defects giving rise to n-type conductivity. Additionally, these calculations also predict defect induced stabilization of cubic BN over graphitic BN. Dissert. Abstr.

QUANTUM MECHANICS OF ELECTRONS IN CRYSTALS WITH GRADED COMPOSITION
M. R. Geller and W. Kohn Mar. 1993 16 p
(Contract N00014-89-J-1530)
(AD-A260294; TR-43) Avail: CASI HC A03/MF A01

The effective Hamiltonian is constructed describing the motion of electrons in compositionally graded crystals which is valid throughout a given energy band and part way into the gaps. The effective Hamiltonian, constructed from the band structures of uniform crystals, also includes the effects of a slowly varying applied scalar potential U(r). Near the edges of a nondegenerate band, this effective Hamiltonian reduces to an effective mass Hamiltonian with position dependent mass (one of several forms previously appearing in the literature): H(sub eff) = 1/2 p(sub i)((1/m*r)(sub ij))p(sub j) + epsilon(r) + U(r), where epsilon(r) is the energy of the band edge as a function of position. The analogous effective mass Hamiltonian for degenerate bands is also derived. Next, more general states-not restricted to the vicinity of a band edge in crystals with composition and applied potential variation in one direction are examined. A Wentzel-Kramer-Brillouin (WKB)-type solution for the envelope functions, as well as the appropriate turning point connection rules is obtained. GRA

DIAMOND HOMOEPITAXY BY CHEMICAL VAPOR DEPOSITION Annual Report, 1 Jan. - 31 Dec. 1992
Andrzej Badzian and Teresa Badzian Feb. 1993 13 p
(Contract N00014-92-J-1421)
(AD-A260551) Avail: CASI HC A03/MF A01

Gem-quality single crystals of diamond were grown by homoepitaxy using microwave plasma assisted chemical vapor deposition. Raman spectra of the (001) film show very low background and the narrowest width at half maximum of the 1332 /cm peak was 1.7 /cm. A prism crystal 1.2 mm high was grown in the group of zone axes (110) direction at 1200 C and 1 percent CH4 in H2. Its Raman peak has a width of 2.7 /cm. Homoepitaxy is a tool used to study growth processes by analyzing the geometrical details of surfaces morphologies. Growth steps on the (001) surface develop in the group of zone axes (110) directions while triangular plates appear on the (111) surface. The (110) atomic plane does not appear in the group of zone axes (110) growth direction with microfaceted (111) and (111) planes present instead. Crystal structure of diamond grown in the (001), (111), (110) substrates, as well as growth sectors developed in conjunction with this epitaxy, were studied by X-ray diffraction techniques: Laue, oscillation and rotation methods. Atomic force microscopy teached atomic resolution on the (001) surface. The presence of a 2.12 A reflection demonstrated distortion of cubic symmetry and deformation of carbon tetrahedra in the case of (111) epitaxy. In the (110) growth sector a polytype/superstructure network with periodicity three times larger than that of the cubic form was determined. In general it is possible to form tetrahedral carbons with the sequence of tetrahedra different from that of cubic and hexagonal diamonds. GRA

ASPECTS OF SINGLE CRYSTAL AND THIN FILM HIGH FIELD ELECTROLUMINESCENCE Ph.D. Thesis
Michael Joseph Rober Swift 1989 319 p
Avail: Univ. Microfilms Order No. BRDX97596

Electro-optical investigations of unimplanted and ion implanted ZnS and ZnSe direct current electroluminescent (DCEL) devices under reverse bias have enabled advances to be made in understanding some of the physical processes which govern the behavior of such devices. The three types of devices studied were ZnS thin films, ZnS single crystal diodes and ZnSe single crystal diodes. For reasons discussed in the text, greatest stability and uniformity in electroluminescence characteristics were achieved using ion implanted ZnSe single crystals and experiments were predominantly based on such devices. A complicated, but effective, fabrication procedure which involved a multilayer contact structure enabled stable current-voltage characteristics and uniform electroluminescence to be obtained from the ion implanted ZnSe diodes. From the current-voltage characteristics it is clear that the dominant mechanism responsible for the observed current in such devices is the tunnelling of electrons through the Schottky barrier. Analysis of the electroluminescence and cathodoluminescence of ZnSe and ZnS single crystal devices in which both manganese ions and erbium ions have been implanted in the same region and to the same concentration allowed relative cross-sections for impact excitation of the Mn(2+) ions

and Er(3+) ions to be calculated. From these calculations it was concluded that the exchange scattering mechanism is responsible for the excitation of Mn(2+) ions. From the applied voltage dependence of the spectral emission intensities of Er(3+) ion transitions in an implanted ZnSe:Er device, the electron energy distribution was shown to be of the Druyvesteyn type. Under certain simplifying assumptions, such an energy distribution can be derived theoretically from the Boltzmann transport equation. Combining theory with experiment shows that the scattering centres which are responsible for the production of a Druyvesteyn distribution have very large impact cross-sections. It is thus concluded that complex molecules, probably involving Er(3+) ions and native lattice defects, are present in these devices. Dissert. Abstr.

RESEARCH ON HIGH EFFICIENCY, LARGE-AREA CuInSe2-BASED THIN-FILM MODULES
K. W. Mitchell and C. Eberspacher Feb. 1993 57 p Prepared in cooperation with Siemens Solar Industries, Camarillo, CA
(Contract DE-AC02-83CH-10093)
(DE93-000077; NREL/TP-413-5332) Avail: CASI HC A04/MF A01

The objective was to demonstrate 12.5 percent aperture efficient, large area (3900 cm(sup 2)) encapsulated thin thin CuInSe2 (CIS) modules. The module design consists of 53 series-connected ZnO/CdS/CIS/Mo/glass cells fabricated on a glass substrate. A baseline characterization of the CIS modules was established during Phase 1. Maps of open circuit voltage provide information on junction quality uniformity. Maps of cell voltages at fixed forward bias show variations in resistance losses due to interconnects. Individual cell I-V curves can be evaluated. Physical nature of defects is correlated using OBIC, EBIC, SEM, tape adhesion, etc. A new world record of 37.7 W and 9.7 percent aperture efficiency was attained for an encapsulated module; an unencapsulated CIS module plate achieved 40.8 W and 10.5 percent aperture efficiency. This thesis consists of three papers. Paper 1 is concerned with the preparation of metastable crystalline high temperature polymorph of Dy2S3 or metastable crystalline high pressure polymorphs of R2S3 (R = Y, Er, Tm, Yb and Lu) by mechanical milling. In Paper 2, copper doped dysprosium sesquisulfide compounds, which have the (eta)-orthorhombic structure, were examined as potential high temperature thermoelectric materials. Paper 3 deals with the use of mechanical alloying and gaseous state diffusion to extend the electrical activity of phosphorus above the maximum reported equilibrium limit in Si(80)Ge(20) alloys. DOE

A YBCO thick film containing 20 percent Ag2O with a T(sub c) of 86.8 K and J(sub c) of 108 A/sq cm was obtained. The film was fabricated by a two-step firing process, i.e., firing the film at 1000 C for 10 minutes and annealing at 970 C for 30 minutes. The two-step firing process, however, was not suitable for the multiple-lead YBCO sample due to the formation of the 211 green phase at 1000 C in the multiple-lead YBCO sample. A BSCCO thick film printed on a MgO coated MSZ substrate and fired at 845 C for 2 hours exhibited a superconducting behavior at 89 K. Because of its porous microstructure, the critical current density of the BSCCO thick film was limited. This report also includes the results of the YBCO and BSCCO materials used as oxide electrodes for ferroelectric materials. The YBCO electroded PLZT showed higher remanent polarization and coercive field than the sample electroded with silver paste. A higher Curie temperature for the PLZT was obtained from the YBCO electroded sample. The BSCCO electroded sample, however, exhibited the same Curie temperature as that of a silver electroded sample. Dissipation factors of the ferroelectric samples increased when the oxide electrode was applied. Author (revised)

COMPOSITIONAL SUPERLATTICES BASED ON PtCl/PtBr MX MATERIALS
A. Saxena, X. Z. Huang, and A. R. Bishop 1992 6 p Presented at the 1992 International Conference on Science and Technology of Synthetic Metals, Goeteborg, Sweden, 12-18 Aug. 1992
(Contract W-7405-eng-36)
(DE93-003700; LA-UR-92-3249; CONF-9208132-8) Avail: CASI HC A02/MF A01

We consider theoretically a novel class of compositional superlattices consisting of alternating layers of quasi-one-dimensional (Q1D) MX (halogen-bridged, transition metal) chain materials. In particular, we have studied a superlattice based on the PtCl/PtBr unit where the Peierls band gap for PtCl is approximately 2.4 eV and approximately 1.5 eV for PtBr. We have calculated electronic properties, optical absorption, and vibrational properties (e.g., Raman spectrum) of an MX superlattice using a discrete, two-band, tight-binding Peierls-Hubbard model. The electronic band structure reveals a typical subband structure and varies with the relative lengths of the constituent PtCl and PtBr units. The MX superlattice can be thought of as an analog of a GaAs/GaAl(x)As(1-x) compositional superlattice but with the added feature that the optical, transport, and various other physical properties are modified due to presence of nonlinear excitations (e.g., polarons) in the doped samples. STUDIES OF MICROSTRUCTURE/CRITICAL CURRENT DENSITY RELATIONSHIPS FOR GRAIN BOUNDARIES IN YBa2Cu3O(7-DELTA) BICRYSTALS
S. E. Babcock, Xue-Yu Cai, D. C. Larbalestier, D. H. Shin, Na Zhang (Wisconsin Univ., Madison.), Yufei Gao, K. L. Merkle, and D. L. Kaiser (National Inst. of Standards and Technology, Gaithersburg, MD.) 1992 5 p Presented at the 6th International Conference on Intergranular and Interphase Boundaries in Materials, Thessaloniki, Greece, 22-26 Jun. 1992
(Contract W-31-109-eng-38)
(DE93-003000; ANL/CP-77534; CONF-920670-6) Avail: CASI HC A01/MF A01

Results of coupled electromagnetic and microstructural studies of bicrystalline YBa2Cu3O(7-delta) specimens are described from a microstructural perspective. High-spatial-resolution transmission electron microscopy techniques (imaging and energy dispersive x-ray microanalysis) are used to probe the structure and composition of the grain boundaries. All of the boundaries studied possess microstructural features that are consistent with their specific electromagnetic character. DOE

LOW-TEMPERATURE DEPOSITION OF ZrC THIN FILMS FROM A SINGLE SOURCE PRECURSOR
David C. Smith, Rodrigo R. Rubiano, Matthew D. Healy, and Robert W. Springer (Massachusetts Inst. of Tech., Cambridge.) 1992 9 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract W-7405-eng-36)
(DE93-007333; LA-UR-93-351; CONF-921101-83) Avail: CASI HC A02/MF A01

Stable zirconium carbide thin films have been deposited from a single source organometallic precursor, tetraneopentyl zirconium, at substrate temperatures above 500C. Materials deposited above this temperature are crystalline by X-ray diffraction. A metal to carbon ratio of 1:2 is observed by Auger electron spectroscopy depth profiling. X-ray photoelectron spectroscopy indicates the zirconium is single phase. The observed spectra correspond well to spectra for zirconium carbide standards. Carbon XPS reveals carbidic and graphitic or hydrocarbon species with a third unknown carbon species. Elastic recoil detection finds a large, up to 16 percent hydrogen content in the thin film. DOE

MODELING OF X-RAY DIFFRACTION LINE BROADENING WITH THE VOIGT FUNCTION: APPLICATIONS TO HIGH-T(c) SUPERCONDUCTORS Ph.D. Thesis
Davor Balzar (Zagreb Univ., Yugoslavia.) Jan. 1993 101 p
(PB93-152072; NISTIR-3398) Avail: CASI HC A06/MF A02

A method to analyze powder-diffraction line broadening is proposed and applied to some novel high-T(c) superconductors. Assuming that both size-broadened and strain-broadened profiles of the pure-specimen profile are described with a Voigt function, it is shown that the analysis of Fourier coefficients leads to the Warren-Averbach method of separation of size and strain contributions. The method was applied to two cubic structures with average volume-weighted domain sizes up to 3600 A, as well as to tetragonal and orthorhombic (La-Sr)2CuO4, which exhibit weak line broadenings and highly overlapping reflections. Comparison with the integral-breadth methods is given. Reliability of the method is discussed in the case of a cluster of the overlapping peaks. The analysis of La2CuO4 and La(1.85)M(0.15)CuO4 (M = Ca, Ba, Sr) high-T(c) superconductors showed that microstrains and incoherently diffracting domain sizes are highly anisotropic. In the superconductors, stacking-fault probability increases with increasing T(c); microstrain decreases. In La2CuO4, different broadening of (h00) and (0k0) reflections is not caused by stacking faults; it might arise from lower crystallographic symmetry. GRA

TOWARDS A FIRST-PRINCIPLES THERMODYNAMICS OF SOLIDS
D. deFontaine and C. Wolverton Aug. 1992 31 p Presented at the 91st Annual Conference of the Deutsche Bunsen-Gesellschaft Fuer Physikalische Chemie, Vienna, Austria, 28-30 May 1992
(Contract DE-AC03-76SF-00098)
(DE93-002544; LBL-32832; CONF-9205273-1) Avail: CASI HC A03/MF A01

Total energy density-functional methods have made it possible to calculate, from first principles, such important properties as cohesive energies, lattice constants, and elastic moduli for elemental crystals and perfectly ordered compounds. Real solids are imperfect, however, so that lattice vibrations and compositional disorder lead to entropy contributions, vibrational, and configurational. When these effects are included in an appropriate manner, properties of real crystals can be computed ab initio as a function of temperature and concentration. Consequently, it is possible to obtain, virtually from the knowledge of atomic numbers alone, such basic thermodynamic properties as free energies, entropies, heats of formation, and lattice parameters for stable and metastable phases, leading, for example, to the successful computation of certain classes of phase diagrams. Recent progress in the field will be reviewed. Application is made to the Pd-Rh-V system. DOE

QUANTUM THEORY OF MULTIWAVE MIXING WITH APPLICATIONS TO SQUEEZING IN BOTH ATOMIC AND SEMICONDUCTOR MEDIA Final Report
Murray Sargent, III 21 Dec. 1992 6 p
(Contract N00014-90-J-1029)
(AD-A259875) Avail: CASI HC A02/MF A01

The overall purpose of the contract was to investigate various aspects of the quantum theory of multiwave mixing with applications to squeezing in both atomic and semiconductor media. In the following seven sections, we related areas. We also list the corresponding papers presented at meetings, the papers published in journals, and the work completed on two books. The topics addressed are: (1) injected atomic coherence; (2) bichromatic and local-field-correction quantum multiwave mixing; (3) composite-cavity mode laser; (4) spectral hole burning and population pulsations in SCL gain media; (5) quantumm multiwace mixing in semiconductor laser media; (6) semiconductor laser photon statistics; and (7) semiconductor laser linewidth. TOPOLOGICAL ORGANIZATION OF (LOW-DIMENSIONAL) CHAOS
N. B. Tufillaro 1992 6 p Presented at the NATO/ASI Summer School: From Statistical Physics to Statistical Inference and Back, Cargese, France, 31 Aug. - 12 Sep. 1992
(Contract W-7405-eng-36)
(DE93-003693; LA-UR-92-3235; CONF-9208188-1) Avail: CASI HC A02/MF A01

Recent progress toward classifying low-dimensional chaos measured from time series data is described. This classification theory assigns a template to the time series once the time series is embedded in three dimensions. The template describes the primary folding and stretching mechanisms of phase space responsible for the chaotic motion. Topological invariants of the unstable periodic orbits in the closure of the strange set

are calculated from the (reconstructed) template. These topological invariants must be consistent with any model put forth to describe the time series data, and are useful in invalidating (or gaining confidence in) any model intended to describe the dynamical system generating the time series. DOE

CHAOTIC DYNAMICS IN ACCELERATOR PHYSICS
J. R. Cary 30 Nov. 1992 26 p
(Contract DE-FG02-86ER-40302)
(DE93-004600; DOE/ER-40302/7) Avail: CASI HC A03/MF A01

Substantial progress was made in several areas of accelerator dynamics. We have completed a design of an FEL wiggler with adiabatic trapping and detrapping sections to develop an understanding of longitudinal adiabatic dynamics and to create efficiency enhancements for recirculating free-electron lasers. We developed a computer code for analyzing the critical KAM tori that binds the dynamic aperture in circular machines. Studies of modes that arise due to the interaction of coating beams with a narrow-spectrum impedance have begun. During this research educational and research ties with the accelerator community at large have been strengthened. DOE

GALILEO'S RELATIVITY PRINCIPLE, THE CONCEPT OF PRESSURE, AND COMPLEX CHARACTERISTICS, FOR THE SIX-EQUATION, ONE-PRESSURE MODEL
H. Makowitz Oct. 1992 27 p
(Contract DE-AC07-76ID-01570)
(DE93-005240; EGG-MS-10535) Avail: CASI HC A03/MF A01

We have studied various formulations of the concept of pressure, in the context of the usual Six-Equation Model of thermal-hydraulics. A different concept of pressure, than the usual one, has been used. This new pressure concept is Galilean Invariant, and results for the One-Pressure Model with the same complex characteristic roots as the 'Basic 3-Posed Model', discussed in the literature for the cases we have investigated. We have also examined several Two-Pressure formulations and shown that two pressures are a necessary but not sufficient condition for obtaining a Well-Posed system. Several counter examples are presented. We have shown that the standard theory is not Galilean Invariant and suggested that the origin of 3-Posedness is due to our closure relationships. We also question whether the current theory can satisfy conservation principles for mass, energy, and momentum. DOE

THERMODYNAMIC AND STOCHASTIC THEORY OF HYDRODYNAMIC AND POWER-PRODUCING PROCESSES
J. Ross 16 Sep. 1992 8 p
(Contract DE-FG03-86ER-13479)
(DE93-006891; DOE/ER-13479/T2) Avail: CASI HC A02/MF A01

Thermodynamics of the transport processes of diffusion, thermal conduction, and viscous flow at a macroscopic level are developed for the simplest cases of one-dimensional transport in fluids for individual linear and nonlinear processes approaching a stationary non-equilibrium state. Formulation has started of thermodynamic and stochastic theory of combinations of transport processes. Global thermodynamic and stochastic theory of open chemical systems far from equilibrium is continued with analysis of a broad class of isothermal, multicomponent reaction mechanisms with multiple steady states with assumed local equilibrium. Stationary solutions are obtained of the master equation for single and multi-intermediate autocatalytic chemical systems. A kinetic potential is identified that governs the deterministic time evolution of coupled tank reactors. A second-order response theory was developed to investigate the effects of external periodic perturbations on a chemical reaction. DOE

THERMODYNAMICALLY-CONSISTENT PHASE-FIELD MODELS FOR SOLIDIFICATION
S. L. Wang (Carnegie-Mellon Univ., Pittsburgh, PA.), R. F. Sekerka (Carnegie-Mellon Univ., Pittsburgh, PA.), A. A. Wheeler (Bristol Univ., England.), B. T. Murray, S. R. Coriell, R. J. Braun, and G. B. McFadden Nov. 1992 26 p Prepared in cooperation with Carnegie-Mellon Univ., Pittsburgh, PA, and Bristol Univ. (England)
(PB93-139012; NISTIR-4956) Avail: CASI HC A03/MF A01

In an effort to unify the various phase-field models that have been used to study solidification, we have developed a class of phase-field models for crystallization of a pure substance from its melt. These models are based on an entropy functional, as in the treatment of Penrose and Fife, and are therefore thermodynamically consistent inasmuch as they guarantee spatially local positive entropy production. General conditions are developed to ensure that the phase field takes on definite values, independent of temperature, for the bulk phases. Specific forms of a phase-field function are chosen to produce two models that bear strong resemblances to the models proposed by Langer and Kobayashi. Our models contain additional nonlinear functions on the phase field that are necessary to guarantee thermodynamic consistency. GRA

SPATIAL DEVELOPMENT OF CHAOS IN AN OPEN FLOW SYSTEM Ph.D. Thesis
Joseph Hanley 1992 181 p
Avail: Univ. Microfilms Order No. DA9302821

We study the spatial development of chaos in an open flow system. The temporal evolution of chaos has been widely studied in many systems. To better understand fully complex flow phenomena such as fluid turbulence we have investigated a system that showed a transition from spatially simple to spatially complex structures, while freezing out the temporal structures. The experimental arrangement to study this problem consists of a vertical axi-symmetric jet of water, with suitable additives, impinging onto a horizontal disk. The jet expands radially and forms a circular hydraulic jump. The hydraulic jump is a standing wave phenomenon and thus effectively freezes the flow patterns in space. The control parameters for this system are nozzle size, nozzle to disk spacing, volume flowrate and the fluid properties, specifically surface tension and viscosity. As flowrate is increased a temporally stable ring structure develops inside the jump. At higher flowrates an increasing number of rings are observed with decreasing spacing. When the number of rings reaches 5 or 6 the system undergoes a transition, specifically, a periodic radial modulation on the innermost ring, indicating a further decrease in length scales. At higher flowrates the modulations extend radially out encompassing more rings and the number of wavelengths on the innermost ring increases, showing a further decrease in length scales. At higher flowrates the system develops a time dependent behavior, indicating a fully turbulent regime. The dependence of these flow features on dimensional groups are derived experimentally. The form of the scaling parameters provides an insight to the physics that governs the flow development. Surface tension was found to have a more dominant effect than viscosity on the ring formation indicating the importance of capillary waves. The dissertation includes an extensive discussion of the experimental techniques, namely optical imaging and surface topology measurements, and defines the parameter space for the formation of temporally stable patterns. We conclude that we observe, for the first time, an open flow system that shows chaos developing solely in space. The route to spatial chaos is analogous to the temporal evolution to infinitely many time scales. Dissert. Abstr.

ACTUATOR STROKE REQUIREMENTS BASED ON A ZERNIKE DECOMPOSITION OF ATMOSPHERIC TURBULENCE
T. R. Kurfess and B. M. Levine 14 Sep. 1992 13 p
(Contract W-7405-eng-48)
(DE93-007393; UCRL-ID-111968) Avail: CASI HC A03/MF A01

This is a Mathematica Note Book that is used to compute the stroke requirements for individual actuators. The strokes are given as a function of frequency. The analysis assumes that both piston and tip/tilt (the first two Zernike modes) have been removed by a separate set of optics. The requirements presented here assume a Komgorov spectrum with a Rytov approximation. Furthermore, the equations for the power spectral density of the atmosphere are simplified somewhat. These simplifications and their justifications are presented in this technical brief. This brief is based on the JPL technical brief, 'Space Time Power Spectral Density Representations for Atmospheric disturbances,' by Marty Levine which summarizes a presentation by Albert Lazzarini given on 6 July 1992 at JPL. ION BEAM MIXING IN MULTI-QUANTUM WELL STRUCTURES Final Report
Bernard L. Weiss 20 Sep. 1992 13 p
(Contract DAJA45-89-C-0040)
(AD-A259772) Avail: CASI HC A03/MF A01

The aims of the project were to investigate impurity induced disordering, using ion implantation, for the fabrication of optical waveguides in Aluminum Gallium Arsenide/Gallium Arsenide quantum well structures. Research prior to the initiation of the contract had indicated that the extent of the disordering, as measured by photoluminescence, was determined by both the nature, energy and dose of the implanted ion, and the temperature and time of the annealing process. While encouraging results were obtained for the loss characteristics of disorder delineated stripe optical waveguides, it was clear that not enough was known about the properties of the disordered QW structures to enable low loss disorder delineated strip optical waveguides to be designed and fabricated in AlGaAs/GaAs MQW structures. In addition the impurity chosen to disorder the QW was also of importance and a detailed evaluation of the appropriate ion suggested that some of the less common impurities would probably be more suitable for photonic devices. FIRST NATIONAL SPACE GRANT CONFERENCE REPORT
1990 129 p Conference held in Columbia, MD, 17-19 Jan. 1990 Sponsored by NASA
(NASA-EP-275; NAS 1.19:275) Avail: CASI HC A07/MF A02

The main business of the conference centered around a series of 15 workshops in which 15 program directors of their designates discussed various components of the Space Grant Program. On the basis of the workshops and conference discussion, the workshop facilitators redrafted and edited the reports, and these reports are presented. The topics covered include: an evaluation of the NASA Space Grant Consortia Programs; pre-college and college education; the use of continuing adult education; publicity and public relations; underrepresented groups; outreach and public service; state and local governments; university-industry interaction; program management; and use of fellowships. For individual titles, see N93-23141 through N93-23155.

The meaningful evaluation of the NASA Space Grant Consortium and Fellowship Programs must overcome unusual difficulties: (1) the program, in its infancy, is undergoing dynamic change; (2) the several state consortia and universities have widely divergent parochial goals that defy a uniform evaluative process; and (3) the pilot-sized consortium programs require that the evaluative process be economical in human costs less the process of evaluation comprise the effectiveness of the programs they are meant to assess. This paper represents an attempt to assess the context in which evaluation is to be conducted, the goals and limitations inherent to the evaluation, and to recommend appropriate guidelines for evaluation. Pre-college education efforts are many and varied, involving the teachers, students, parents, museums, and youth groups. However, it is necessary to reach out to school administration at all levels if teachers are to be innovative in their approaches. This introductory meeting clearly indicated that more interaction between the participants would be profitable. It is clear that the science pipeline leading from kindergarten to college entry needs to be filled with students. What is not clear is how we can do it. The plethora of projects being pursued by the NASA Space Grant College Fellowship (NSGC) programs to accomplish that goal are heartening and exciting. However, this large gamut of programs may also indicate how new we are in this game and how little anyone knows about creating a pre-college interest in science and engineering. In a way, it resembles the situation of the common cold--there is no known cure yet, so there are many so-called remedies. Unfortunately, the time we had together was entirely too short to address the evaluation situation, so that we can in the future zero in on the most effective approaches. This report is a summary of the many ways the different NSGC' s are approaching pre-college education and a list of suggestions. Author

The declining pool of graduates, the lack of rigorous preparation in science and mathematics, and the declining interest in science and engineering careers at the precollege level promises a shortage of technically educated personnel at the college level for industry, government, and the universities in the next several decades. The educational process, which starts out with a large number of students at the elementary level, but with an ever smaller number preparing for science and engineering at each more advanced educational level, is in a state of crisis. These pipeline issues, so called because the educational process is likened to a series of ever smaller constrictions in a pipe, were examined in a workshop at the Space Grant Conference and a summary of the presentations and the results of the discussion, and the conclusions of the workshop participants are reported. The 21 Space Grant Programs represent a broad range of organizational structures which operate programs ranging in size from single university organizations to organizations including up to 41 members involving a composite of industrial organizations such as state agencies, and universities. Some of the space grant awards were made to organizations already in existence with on-going programs while other awards were made to consortia newly formed for the purpose of applying to the Space Grant Program. The workshop on organization and management of Space Grant Programs provided an opportunity for directors and program representatives to discuss and compare the relative advantages and disadvantages of the various models being used. This paper offers examples of the diversity of organizations, summarizes the common concerns to be met by each organizational model, and provides a case study of the Texas Space Grant Consortium organization. The effective use of Space Grant Program fellowships are critical in meeting program objectives. In the first year of operation, the 21 colleges/consortia will expend from 30-40 percent of their grants for fellowships; program policy will allow up to 50 percent to be spent for fellowships. Thus, fellowship policy must be carefully implemented and monitored. Author

Though potentially of great benefit to the nation, the experience of the workshop participants and their discussions with Sea Grant and Land Grant officials make it clear that the Space Grant Program must avoid certain pitfalls of the past and present if it is to be successful. The most important of these are listed and briefly discussed. Author

NASA'S STRATEGIC PLAN FOR EDUCATION. A STRATEGY FOR

CHANGE, 1993-1998
Dec. 1992 76 p
(NASA-EP-289; NAS 1.19:289) Avail: CASI HC A05/MF A01

NASA's education vision is to promote excellence in America's education system through enhancing and expanding scientific and technological competence. In doing so, NASA strives to be recognized by the education community as the premier mission agency in support of the National Education Goals and in the development and implementation of education standards. To realize this vision, NASA has clearly defined and developed three specific goals to promote excellence in education. Specific objectives and milestones are defined for each goal in the body of this strategic plan. Derived from text

NASA'S EDUCATION PROGRAM INVENTORY FY 91
Aug. 1992 87 p
(NASA-EP-284; NAS 1.19:284) Avail: CASI HC A05/MF A01

In 1988, the Education Division produced an inventory of NASA-supported education programs. Since then, mathematics, science, and technology education has taken on a more visible role, not only as part of NASA's mission, but as part of the National Education Goals and other Federal initiatives. Therefore, it became important to update the 1988 inventory in order to achieve a more accurate and comprehensive look at NASA's educational programs. The data collected is summarized and descriptions of each program are provided. Derived from text

IN THE NATIONAL INTEREST: THE FEDERAL GOVERNMENT AND RESEARCH-INTENSIVE UNIVERSITIES
Dec. 1992 67 p
(PB93-140135) Avail: CASI HC A04/MF A01

Seventeen agencies developed a Federal government perspective on its relationship with research-intensive universities both now and for the future. Three key themes are conveyed. First, it describes the broad, complex, and interdependent relationship that has developed between research-intensive universities and the Federal government. Second, it identifies critical trends and issues that are affecting this relationship. And third, it reaffirms principles and makes recommendations whose purpose is to assure that the relationship between the Federal government and the research-intensive universities is maintained, nurtured, and enhanced. FRAMEWORK FOR DECISION MAKING: AN EPA PERSPECTIVE
Stig Regli, John E. Cromwell, Xin Zhang, Allen B. Gelderloos, and William D. Grubbs Aug. 1992 82 p
(PB93-134369; EPA/811/R-92/005) Avail: CASI HC A05/MF A01

The United States Environmental Protection Agency (EPA) is developing national regulations to control for disinfectants and disinfection by-products (D/DBP's) in public drinking water supplies. EPA intends to propose regulations that will apply to all public water systems using disinfection

and serving non-transient populations--approximately 220 million people. This regulation would be unlike the current maximum contaminant level (MCL) for total trihalomethanes (TTHM's) which only pertains to systems serving more than 10,000 people. A fundamental goal in setting any new regulation is to be able to conclude with confidence that the resultant changes in treatment would lead to a significant overall decrease in risk to public health. This paper will describe the analysis that EPA is undertaking in pursuit of meeting this goal. GRA

This paper presents a conceptual design for the 21st Century government organization. This design is applicable to the future US Postal Service and generalizable to other large government agencies. The design is based on conjectures in three areas: capabilities of information technology in the early 21st Century; motivations, needs, strengths, and weaknesses of members of the 21st Century workforce; and needs of large public organizations. The design addresses topics such as coordination, career tracks, communications, and the seamless integration of information resources. DOE

SCIENCE, TECHNOLOGY, AND THE STATES IN AMERICA'S THIRD CENTURY
Sep. 1992 75 p
(ISBN-1-881054-03-9) Avail: CASI HC A04/MF A01

This report of the Carnegie Commission on Science, Technology, and Government was prepared by the Task Force on Science and Technology and the States. The Commission was established in April 1988 to assess the mechanisms by which the federal government and the states incorporate scientific and technological knowledge into policymaking processes. The Commission formed the task force in 1991 to study a key level of this nation's government that, in earlier studies of the Commission, had been examined only tangentially. The task force held its first meeting 9-10 Sep. 1991, in Middleburg, Va. Subsequent meetings were held 15-16 Mar. 1992, in Deerfield Beach, Fla., and 14 May 1992, in Washington, DC. The task force was chaired by former governor and Advisory Council member Richard F. Celeste. The task force members were William O. Baker, Arden L. Bement, Erich Bloch, Lawton Chiles, Daniel J. Evans, B. R. Inman, H. Graham Jones, Frank E. Moiser, Walter H. Plosila, Donna Shalala, Luther Williams, Linda S. Wilson, and Charles E. Young. Christopher M. Coburn was the staff director for the task force. Commission staff members who worked with the task force and contributed to the development of the report were David Z. Robinson, Maxine L. Rockoff, Jonathan Bender, and David M. Kirch. Thomas H. Moss also assisted the task force. The task force is grateful to Harvey Brooks for his interest and invaluable insight. The final report was drafted by Duncan M. Brown, and the manuscript was edited by Jeannette L. Aspden. The report is endorsed by the task force and was approved by the Commission at its June 1992 meeting.

NASA CONTRACT MANAGEMENT
Dec. 1992 42 p
(GAO/HR-93-11) Avail: CASI HC A03/MF A01; GAO, PO Box 6015, Gaithersburg, MD 20877 HC

In January 1990, in the aftermath of scandals at the Department of Defense and Housing and Urban Development, the General Accounting Office began a special effort to review and report on federal government program areas that we considered 'high risk.' After consulting with congressional leaders, GAO sought, first, to identify areas that are especially vulnerable to waste, fraud, abuse, and mismanagement. We then began work to see whether we could find the fundamental causes of problems in these high-risk areas and recommend solutions to the Congress and executive branch administrators. We identified 17 federal program areas as the focus of our project. These program areas were selected because they had weaknesses in internal controls (procedures necessary to guard against fraud and abuse) or in financial management systems (which are essential to promoting good management, preventing waste, and ensuring accountability). Correcting these problems is essential to safeguarding scarce resources and ensuring their efficient and effective use on behalf of the American taxpayer. This report is one of the high-risk series reports, which summarize our findings and recommendations. It describes our concerns over the National Aeronautics and Space Administration's (NASA) lack of adequate controls over a variety of contract management and related activities. NASA has implemented or begun to implement most of the recommendations we have made for improving these activities. NASA has also implemented other contract management improvement initiatives.

ADVANCED TEAM DECISION MAKING: A DEVELOPMENTAL METHOD
Caroline E. Zsambok, Gary Klein, Molly M. Kyne, and David W. Klinger 3 Aug. 1992 28 p
(Contract MDA903-90-C-0117)
(AD-A259512) Avail: CASI HC A03/MF A01

This document describes Advanced Team Decision Making: A Developmental Model (ATDM). Based on our observations of numerous tactical and strategic decision making teams, and on a review of relevant literature, Klein Associates derived three key components of advanced team decision making: team self identity, team conceptual level, and team self monitoring. The model contains ten key behaviors critical to team development in these components. We developed this document for the Industrial College of the Armed Forces. It describes the ATDM model in language compatible with the needs of ICAF students who are being trained to transition into strategic-level leadership positions. ATDM was first introduced in ICAF's 1992 curriculum. This document is the second of three components of the team training program Klein Associates designed for ICAF. The first component is an introductory lecture about ATDM (called Lesson 1111 in this document) that we delivered to the faculty and student body. The third component (called Lesson 1311) is an exercise designed for experiential learning. The exercise and facilitated after-action review sessions give students an opportunity to practice, discuss, and improve their team decision-making skills in a manner consistent with the ATDM model. Copies of this document are also available from Klein Associates. GRA

THE STUDY OF CREW COORDINATION AND PERFORMANCE IN HIERARCHICAL TEAM DECISION MAKING Interim Report
Clint A. Bowers, Julie M. Urban, and Ben B. Morgan, Jr. Nov. 1992 78 p
(Contract N00014-90-J-1846)
(AD-A259514; TR-92-01) Avail: CASI HC A05/MF A01

This report describes the theoretical foundations, methodology, and initial results of an ongoing empirical investigation of team decision making. The theoretical foundations are based on the team process and performance literature, which is discussed in terms of a broad model of team performance. To allow for the measurement of various elements of team performance depicted in the model, a computerized testbed has been developed. This testbed, the Team Performance Assessment Battery (TPAB), includes team and individual tasks arranged according to a synthetic work methodology. Using TPAB, an empirical study has been performed in which team structure and workload were manipulated in a between groups design. The results of this study are interpreted in the context of the team performance model. Implications for future research are also discussed. GRA

TOTAL QUALITY MANAGEMENT: GOOD ENOUGH FOR GOVERNMENT WORK
Mike Prowse Oct. 1992 242 p
(AD-A259847; AU-ARI-90-9) Avail: CASI HC A11/MF A03

Changing the management foundation principles under which we work is addressd. The management principles discussed are based on the concept of strategic quality management, which includes total quality management (TQM). Total quality management covers the entire life cycle of an organization, including the organization's products or services. It is strategic to an organization because it deals not only with the internal environment but also the external environment. TQM goes beyond systems engineering to provide principles of organizational design, leadership, and human engineering. It is the system integrator in an organization, bringing together people, equipment, methods, and machines to effectively satisfy customer expectations. TQM is an organizational culture, a set of norms, and a way to perform the organization's functions. GRA

IMPLEMENTING TOTAL QUALITY MANAGEMENT (TQM) 1: THE COMMAND IMPERATIVE Interim Report, Nov. 1990 - Nov. 1991
Charles N. Weaver and Malcolm T. Upton Dec. 1992 23 p
(AF Proj. 7719)
(AD-A259885; AL-SR-1992-0012) Avail: CASI HC A03/MF A01

The role senior leadership must play in the Total Quality Management/Methodology for Generating Efficiency and Effectiveness Measures (TQM/MGEEM) process and philosophy is documented. Generally observed characteristics of DOD organization TQM implementations and their weaknesses are discussed. Successful TQM implementation depends on direct commander involvement in several areas of the TQM effort including training, empowerment through the Quality Council, establishment of measures, championing of TQM and the mission statement, and continual improvement efforts. Finally, a call to action is issued for the commanders, explaining that with their continual, visible commitment to a TQM effort, all else will follow and without this type of commitment, any efforts toward TQM are doomed to failure. PERMISSIVE PLANNING: A MACHINE-LEARNING APPROACH TO PLANNING IN COMPLEX REAL-WORLD DOMAINS M.S. Thesis
Scott W. Bennett Jan. 1993 128 p
(Contracts N00014-86-C-0309; N00014-91-J-1563)
(AD-A260019; UIUC-BI-AI-93-01) Avail: CASI HC A07/MF A02

Classical planning techniques have some serious problems when employed in real-world domains. In classical planning, it is assumed we know the current state of the world and can project that state through a reasonably well-defined set of actions to yield a future state. However, perfect models of the world and of operators are not possible in most domains. Consequently, discrepancies occur between the projected future state and the observed future state. In these complex domains, the success of the plan can never be guaranteed. Furthermore, an important tradeoff exists between the time spent constructing a plan and its resulting chance of success. Several approaches to these problems have been investigated, including the use of decision-theoretic methods and the incorporation of reactivity into planners. We present a new technique called permissive planning. Explicit approximations are employed in representing the world state and operators. Plans are then constructed efficiently using the approximate theory. In response to plan execution failures, plans are refined so they become less sensitive to the approximate knowledge used in their initial construction. This is achieved by tuning parameters of the plan so as to minimize the expected future deviation. Each permissive plan has a target success rate and a degree of confidence desired in that success rate. We present a formal permissive planning algorithm which can be shown to either produce a plan with the desired success rate and degree of confidence, if possible, or otherwise to return the plan failing short of the target but with the best possible success rate. TOTAL QUALITY MANAGEMENT IN THE FEDERAL GOVERNMENT. IMPLEMENTATION OF TQM IN FEDERAL AGENCIES RECEIVING THE FEDERAL QUALITY INSTITUTE QUALITY IMPROVEMENT PROTOTYPE AWARD, 1990-1992
Claudia Drake Dec. 1992 84 p
(PB93-154573) Avail: CASI HC A05/MF A01

The paper attempts to analyze case studies of federal agencies which have been deemed successful at implementing total quality management (TQM) to (1) identify which components of TQM (based on W. Edwards Deming's Fourteen Points) are being implemented in those agencies, and (2) identify the pathway of implementation. As a result, it can be determined whether selected Federal Agencies have been able to implement all components of orthodox TQM, and which strategy or model for the implementation of TQM in Federal Government have been used successfully. AN EVALUATION OF SCHEDULE METRICS USED WITHIN AERONAUTICAL SYSTEMS CENTER M.S. Thesis
Robert J. Hayes and Lawrence M. Miller Sep. 1992 221 p
(AD-A260113; AFIT/GSM/LSY/92S-12) Avail: CASI HC A10/MF A03

This study focused on a selected group of schedule metrics in use at Aeronautical Systems Center (ASC) acquisition program offices. Over 300 metrics were collected from the System Program Offices (SPO's). The metrics data was sorted into the categories of cost, schedule, and performance. In order to narrow the scope of the project, the team decided to focus on schedule metrics. Seven of the most common schedule metrics were selected for evaluation by a group of five experienced acquisition professionals. The group was asked to input the likely behaviors driven by the metrics being addressed by the study. Next, they were asked to rate the metrics through a Group Support System at Armstrong Laboratory, Human Resources Division. The evaluation group rated how well the metric-driven behaviors contributed to continuous improvement. Results of the study showed a wide spread of behaviors, both positive and negative, that would likely be driven by the metrics. Most of the metrics rated were found to need improvement in terms of influencing behaviors that would lead to continuous improvement. However, many good metric-driven behaviors were identified and could prove helpful to program offices undergoing the challenge of developing their own internal metrics. GRA

METHOD AND APPARATUS FOR FILTERING VISUAL DOCUMENTS
Patent Application
Mark E. Rorvig, inventor (to NASA) and Robert O. Shelton, inventor (to NASA) 5 Feb. 1993 19 p
(NASA-Case-MSC-22093-1; NAS 1.71:MSC-22093-1; US-Patent-Appl-SN-014985) Avail: CASI HC A03/MF A01

A method and apparatus for producing an abstract or condensed version of a visual document is presented. The frames comprising the visual document are first sampled to reduce the number of frames required for processing. The frames are then subjected to a structural decomposition process that reduces all information in each frame to a set of values. These values are in turn normalized and further combined to produce only one information content value per frame. The information content values of these frames are then compared to a selected distribution cutoff point. This effectively selects those values at the tails of a normal distribution, thus filtering key frames from their surrounding frames. The value for each frame is then compared with the value from the previous frame, and the respective frame is finally stored only if the values are significantly different. The method filters or compresses a visual document with a reduction in digital storage on the ratio of up to 700 to 1 or more, depending on the content of the visual document being filtered. NASA

GENERATION OF COVARIANCE DATA AMONG VALUES FROM A SINGLE SET OF EXPERIMENTS
D. L. Smith 1992 13 p Presented at the Nuclear Energy Agency Science Committee Specialists Meeting on Evaluation and Processing of Covariance Data, Oak Ridge, TN, 7-9 Oct. 1992
(Contract W-31-109-eng-38)
(DE93-004192; ANL/EP/CP-78013; CONF-9210173-3) Avail: CASI HC A03/MF A01

Modern nuclear data evaluation methods demand detailed uncertainty information for all input results to be considered. It can be shown from basic statistical principles that provision of a covariance matrix for a set of data provides the necessary information for its proper consideration in the context of other included experimental data and/or a priori representations of the physical parameters in question. This paper examines how an experimenter should go about preparing the covariance matrix for any single experimental data set he intends to report. The process involves detailed examination of the experimental procedures, identification of all error sources (both random and systematic), and consideration of any internal discrepancies. Some specific examples are given to illustrate the methods and principles involved. DOE

OBJECT TECHNOLOGY: A WHITE PAPER
S. R. Jordan, L. F. Arrowood, W. D. Cain, W. M. Stephens, and B. D. Vickers 11 May 1992 171 p
(Contract DE-AC05-84OT-21400)
(DE93-006037; K/CSD/INF-92/27) Avail: CASI HC A08/MF A02

Object-Oriented Technology (OOT), although not a new paradigm, has recently been prominently featured in the trade press and even general business publications. Indeed, the promises of object technology are alluring: the ability to handle complex design and engineering information through the full manufacturing production life cycle or to manipulate multimedia information, and the ability to improve programmer productivity in creating and maintaining high quality software. Groups at a number of the DOE facilities have been exploring the use of object technology for engineering, business, and other applications. In this white paper, the technology is explored thoroughly and compared with previous means of developing software and storing databases of information. Several specific projects within the DOE Complex are described, and the state of the commercial marketplace is indicated. DOE

OCCURRENCE REPORTING AND PROCESSING SYSTEM (ORPS) LESSONS LEARNED: TOOLS TO IMPROVE WORKPLACE PERFORMANCE
S. L. Commander 1992 13 p Presented at the 16th Training Resources and Data Exchange: Managing for Performance and Results, Seattle, WA, 2-4 Nov. 1992
(Contract DE-AC07-76ID-01570)
(DE93-005241; EGG-M-92367; CONF-921187-3) Avail: CASI HC A03/MF A01

Various Department of Energy (DOE) orders require DOE and DOE contractor personnel to review abnormal events to gain lessons learned information. The term 'event' is used to mean a real-time occurrence. When reviewing events data, it must be possible to determine what happened and why (including root causes), the impacts, the appropriate corrective actions, and any lessons learned that might be applicable to activities of other operations or contractors. Merely obtaining the information will not prevent occurrence of a similar event; contributing conditions must be

corrected. It is important for managers, trainers, and others to learn from the events of others so that they may apply these experiences to their own activities. Reports of events must be analyzed to determine possible applicability to other facilities and/or job functions. Relevant information can then be used to correct defects and improve facilities and operations, thus making them more efficient and safer for all employees. Lessons learned information is particularly helpful in planning employee training and in developing training curriculum and programs. Lessons learned information can be obtained from many sources. It can be found in the Safety Performance Measurement System's Computerized Accident/Incident Reporting System (CAIRS) module, the S&H Publications module, the Unusual Occurrence Reports module, and the Office of Nuclear Safety 'Operating Experience Weekly Summary.' One important source of lessons learned information is the Occurrence Reporting and Processing System (ORPS) database, which contains event data from September 1, 1990, to the present. This report discusses this source. DOE

SEARCHING THE OCCURRENCE REPORTING AND PROCESSING SYSTEMS (ORPS) DATABASE
S. L. Commander Nov. 1992 11 p Presented at the 16th Training Resources and Data Exchange: Managing for Performance and Results, Seattle, WA, 2-4 Nov. 1992
(Contract DE-AC07-76ID-01570)
(DE93-005242; EGG-M-92365; CONF-921187-4) Avail: CASI HC A03/MF A01

The Occurrence Reporting and Processing System (ORPS) is a computerized method to submit, collect, update, and sign occurrence reports required by US Department of Energy (DOE) Order 5000.3B, Occurrence Reporting and Processing of Operations Information. The basic reason for investigating and reporting the causes of occurrences is to enable the identification of corrective actions to prevent recurrence and, thereby, protect the health and safety of the public, the workers, and the environment. ORPS provides the DOE community with a readily accessible database that contains information about occurrences at DOE facilities, causes of those occurrences, and corrective actions. This information can, therefore, be used to identify and analyze trends in occurrences. The ORPS database resides on a host computer located at the Idaho National Engineering Laboratory (INEL) in Idaho Falls, Idaho. The database can be accessed from any DOE site via computer terminals or personal computers (PCs) that are set up to access ORPS. DOE

GJOIN: A PROGRAM FOR MERGING TWO OR MORE GENESIS DATABASES
G. D. Sjaardema Dec. 1992 35 p
(Contract DE-AC04-76DP-00789)
(DE93-007709; SAND-92-2290) Avail: CASI HC A03/MF A01

GJOIN is a two- or three-dimensional mesh combination program. GJOIN combines two or more meshes written in the GENESIS mesh database format into a single GENESIS mesh. Selected nodes in the two meshes that are closer than a specified distance can be combined. The geometry of the mesh databases can be modified by scaling, offsetting, revolving, and mirroring. The combined meshes can be further modified by deleting, renaming, or combining material blocks, sideset identifications, or nodeset identifications. GJOIN is one of the mesh generation tools in the Sandia National Laboratories Engineering Analysis Code Access System (SEACAS). GJOIN is typically used with the other SEACAS mesh generation codes GEN3D, GENSHELL, GREPOS, and Aprepro. DOE

NATIONAL SECURITY AND NATIONAL COMPETITIVENESS: OPEN SOURCE SOLUTIONS NASA REQUIREMENTS AND CAPABILITIES
Gladys A. Cotter Mar. 1993 11 p
(NASA-TM-4458; NAS 1.15:4458) Avail: CASI HC A03/MF A01

Foreign competitors are challenging the world leadership of the U.S. aerospace industry, and increasingly tight budgets everywhere make international cooperation in aerospace science necessary. The NASA STI Program has as part of its mission to support NASA R&D, and to that end has developed a knowledge base of aerospace-related information known as the NASA Aerospace Database. The NASA STI Program is already involved in international cooperation with NATA/AGARD/TIP, CENDI, ICSU/ICSTI, and the U.S. Japan Committee on STI. With the new more open political climate, the perceived dearth of foreign information in the NASA Aerospace Database, and the development of the ESA database and DELURA, the German databases, the NASA STI Program is responding by sponsoring workshops on foreign acquisitions and by increasing its cooperation with international partners and with other U.S. agencies. The STI Program looks to the future of improved database access through networking and a GUI; new media; optical disk, video, and full text; and a Technology Focus Group that will keep the NASA STI Program current with technology. (Contract NCC9-16; RICIS Proj. SR-02)
(NASA-CR-192820; NAS 1.26:192820) Avail: CASI HC A03/MF A01

The primary goal of reusing software components is that software can be developed faster, cheaper and with higher quality. Though, reuse is not automatic and can not just happen. It has to be carefully engineered. For example a component needs to be easily understandable in order to be reused, and it has also to be malleable enough to fit into different applications. In fact the software development process is deeply affected when reuse is being applied. During component development, a serious effort has to be directed toward making these components as reusable. This implies defining reuse coding style guidelines and applying then to any new component to create as well as to any old component to modify. These guidelines should point out the favorable reuse features and may

apply to naming conventions, module size and cohesion, internal documentation, etc. During application development, effort is shifted from writing new code toward finding and eventually modifying existing pieces of code, then assembling them together. We see here that reuse is not free, and therefore has to be carefully managed. Author

EVALUATING THE POTENTIAL OF COMBINING AN EXPERT SYSTEM AND SIMULATION FOR LAN SELECTION Ph.D. Thesis
Peggy Lea McDoniel Luster 1992 181 p
Avail: Univ. Microfilms Order No. DA9237324

Local Area Networks (LANs) made their debut in the office and today are an essential tool for users in business, government, and universities. While non-intelligent terminals remain a viable technology, most organizations are moving toward the LAN connected PC as the network of choice. As mission critical mainframe/minicomputer applications are downsized to LANs, LAN design and performance takes on greater importance, and an enhanced approach for LAN design would be valuable. Enhancing the performance of a LAN involves the analysis of a wide range of technical and user factors. Human experts in the field are scarce; alternative approaches to designing LANs are needed. One suggestion has been to use an expert system--a form of artificial intelligence (AI). A taxonomy exists for another suggested approach--combining an expert system with simulation. The cooperative approach is one possible combination in which an expert system and simulation can be used together to perform one task. The synergistic application of the technologies of AI and simulation to a given problem may lead to a much better solution with a higher chance of use than would the application of either one of the technologies by itself. The objective of this research is to develop and evaluate the synergistic approach of combining an expert system and simulation for LAN selection. To evaluate the effectiveness, LANs were designed using scenarios by human experts, human experts with the assistance of a simulation model, an expert system, and an expert system coupled with a simulation model. The LAN designs were simulated repetitively to produce user response times. To determine the effectiveness of the different approaches, response times were compared using non-parametric statistics. LAN response time results indicate that the expert system and combination system constructed in this study are valid systems and are viable methods to use in designing LANs. This study has shown that alternative approaches to human experts do exist. Based on the results, those not expert in LAN design can use either the expert system of the cooperative combination to produce LAN designs of quality comparable to those designed by human experts. AEROBA: A CONTROL BLACKBOARD APPROACH FOR MODEL FORMULATION Ph.D. Thesis
Shue-Feng Tzeng Liou 1992 323 p
Avail: Univ. Microfilms Order No. DA9232535

During a model formulation process, the control is used to dynamically apply various strategies to the appropriate sources of knowledge for the proper parts of problem. The importance of the control aspect has been emphasized in the literature. However, previous studies in automated model formulation use various AI techniques with pre-defined control strategies and can not provide enough support for simulating the expert's modeling process. In order to develop a computerized system based on the expert's model formulation process, a set of verbalization protocols was collected from the experts in managerial domains. The analysis provides two major findings, opportunism and control features. In terms of opportunism, the expert is understood as using various cognitive panels and frequently changing the focus of attention during the formulation process. During this process, the expert also uses various control features for directing the formulation progress. The protocol analysis provides key inputs to the design of the implementation architecture, AEROBA. Due to the opportunism observed from the expert's protocols, the blackboard architecture is selected for the AEROBA design, In this blackboard architecture, an EER model (Extended Entity Relationship model) is used to define the blackboard data structure, a structure transformation approach based on the EER constructs is used to design the domain knowledge, and finally, a control blackboard approach is used to design the control. The AEROBA control simulates the control aspect observed from the protocol analysis. With the incorporation of the control features, AEROBA supports a diverse reasoning process and hence extends the flexibility of control in automated model formulation. The prototype of the AEROBA system is implemented in Common LISP on a SUN 3/160 workstation. The evaluation of the AEROBA system involves two approaches: validation and verification. Validation is used to check the correctness of the formulations outcomes and the formulation process of the system. Verification is used to determine the usefulness, called the formulation effectiveness, of the system. The evaluation indicates that the AEROBA approach is an appropriate way to realize the abstract control aspect in model formulation into a computerized environment. Dissert. Abstr.

N93-23184 Indiana Univ., Bloomington.
THE NATURE OF RELEVANCE IN INFORMATION RETRIEVAL: AN EMPIRICAL STUDY Ph.D. Thesis
Taemin Kim Park 1992 209 p
Avail: Univ. Microfilms Order No. DA9231644

This research is concerned with end users' evaluative attitudes and behaviors in accepting or rejecting citations from a document retrieval system - the concept of 'relevance.' In spite of a rich literature about the meaning of relevance in information science, a consensus meaning has not yet been found. The nature of relevance has not been investigated from the end users' point of view and an empirical study concerning the users' concept of relevance does not exist. Relevance and relevance judgments play a key role in the evaluation of the performance of a document retrieval system and are central to doing experimental information retrieval (IR) research in particular. They have been employed as a standard criterion for measuring the effectiveness of an information system and have been a subject of heated debate from a methodological point of view. As a result, relevance and relevance judgements have become stumbling blocks for interpreting the results of IR experimental research as well as advancing IR theory. Using a naturalistic inquiry methodology, the present research is an empirical study of users' relevance interpretations. A model of a user's relevance interpretation is presented, which reflects the nature of the thought process of a user in evaluating bibliographic citations produced by a document retrieval system. Three major categories of interpretative criteria - internal context, external context and problem context - are identified and described. Users' relevance assessments involve several layers of interpretation that are derived from their experience, perceptions and private knowledge related to the particular information problem at hand. Dissert. Abstr.

CONCENTRATION AND DIVERSITY IN INFORMETRIC RESEARCH Ph.D. Thesis [CONCENTRATIE EN DIVERSITEIT IN INFORMETRISCH ONDERZOEK]
Ronald Rousseau 1992 268 p In BELORUSSIAN
Avail: Univ. Microfilms Order No. DA9234353

The purpose of this thesis is to make a study of functions being used to measure concentration and diversity. As a means to differentiate among functions presented in literature the axiomatic method is used, the Lorenz curve playing a significant part as well. First, the case is studied in which a number of items is distributed over a fixed number of sources. According to the distribution this leads to situations with different concentrations. By imposing more or less restricting requirements on functions a first classification of measures (type 1, type 2 and type 3) can be achieved for a fixed number of sources. The well-known Gini index e.g. is a concentration measure of type 2, the coefficient of variation is a concentration measure of type 3, and Shannon's index a diversity measure of type 1. In this classification a measure of a particular type is automatically a measure of a type with a smaller number as well. Next, the interesting problem is studied where situations with a different number of sources are compared

as for concentration or diversity. A number of new measures is proposed, inferred from a shifted version of the Lorenz curve. In the final chapter it is specified how to use these measures in informetrics: e.g. in the study of the evolution of bibliographies or in determining a set of core journals. Dissert. Abstr.

ASSESSING FEDERAL AND COMMERCIAL INFORMATION SECURITY NEEDS

David F. Ferraiolo, Dennis M. Gilbert, and Nickllyn Lynch Nov. 1992 45 p

(PB93-138956; NISTIR-4976) Avail: CASI HC A03/MF A01

The study assesses the current and future information technology (IT) security needs of the commercial, civil, and military sectors. The primary objectives were as follows: determine a basic set of information protection policies and control objectives that pertain to the secure processing needs of organizations within all sectors; and identify protection requirements and technical approaches that are used, desired, or sought so they can be considered for future federal standards and guidelines. The findings of the study address the basic security needs of IT product users, including system developers, end users, administrators, and evaluators. Security needs have been identified based on actual existing and well-understood security organizational practices. GRA

US GEOLOGICAL SURVEY LIBRARY CLASSIFICATION SYSTEM

R. Scott Sasscer 1992 82 p

(PB93-129708; USGS-Bull-2010; LC-91-39984) Avail: CASI HC A05/MF A01

The U.S. Geological survey library classification system has been designed for an earth science library. It is a tool, assigning classification numbers to earth science and allied pure science library materials in order to collect these materials into related subject groups on the library shelves and arrange them alphabetically by author and title. It can also be used as a retrieval system to assess these materials through the subject and visible geographic classification numbers. The purpose of the publication is to provide the earth science community with a classification and retrieval system for earth science materials, to provide sufficient explanation of its structure and use, and to enable library staff and clientele to classify or access research materials in a library collection. EFFECTIVENESS OF FEATURE AND CLASSIFIER ALGORITHMS IN CHARACTER RECOGNITION SYSTEMS

C. L. Wilson Dec. 1992 16 p

(PB93-147197; NISTIR-4995) Avail: CASI HC A03/MF A01

At the first Census Optical Character Recognition (OCR) Systems Conference, NIST generated accuracy data for more than 40 character recognition systems. Most systems were tested on the recognition of isolated digits and upper and lower case alphabetic characters. The recognition experiments were performed on sample sizes of 58,000 digits, and 12,000 upper and lower case alphabetic characters. The algorithms used by the 26 conference participants included rule-based methods, image-based methods, statistical methods, and neural networks. The neural network methods included Multi-Layer Perceptrons, Learned Vector Quantitization, Neocognitrons, and cascaded neural networks. In this paper, 11 different systems are compared using correlations between the answers of different systems, comparing the decrease in error rate as a function of confidence of recognition. This comparison shows that methods that used different algorithms for feature extraction and recognition performed with very high levels of correlation. This is true for neural network systems, hybrid systems, and statistically based systems, and leads to the conclusion that neural networks have not yet demonstrated a clear superiority to more conventional statistical methods. GRA

MEDICAL SUBJECT HEADINGS: SUPPLEMENTARY CHEMICAL RECORDS, 1993 Final Report, 1970-1992

Dec. 1992 1260 p

(PB93-115244; NLM/MED-93/04) Avail: CASI HC A99/MF A10

The document contains records of approximately 22,000 chemicals which since 1970 have been mentioned in a significant way in journals indexed in MEDLINE, the National Library of Medicine's online bibliographic database. Originally housed in a manual card file, these records were incorporated as a subset of the MEDLARS MeSH (Medical Subject Headings) file, and became searchable online in June 1980. The present list does not include any of the chemical descriptors that are to be found in the D Category of MeSH. The publication is intended to assist indexers, and the users of Index Medicus and MEDLINE. For the indexer, it provides more specific entries than those available in the printed MeSH. It permits users of Index Medicus to locate the chemical subject headings under which citations referring to a more specific chemical can be found. GRA

MEAN LEVELS IN NONLINEAR ANALYSIS AND IDENTIFICATION

J. C. PeytonJones (Sussex Univ., Brighton, England.) and S. A. Billings 11 Jun. 1992 24 p

(RR-454; ETN-93-93494) Copyright Avail: CASI HC A03/MF A01

The effects of data pretreatment and mean levels upon nonlinear model structures is investigated. Techniques which are commonly used to prefilter data in linear system identification are shown to alter the model structure in the nonlinear case. The effects of mean levels are considered in detail and an unraveling algorithm is derived to recover the underlying system model when the offsets are external to the system. A mapping from the time domain to the frequency domain is introduced for the case where offsets can be considered as an implicit part of the system. ESA

ACCESS METHODS FOR LARGE, MULTIFUNCTIONAL KNOWLEDGE BASES Ph.D. Thesis

Liane Elizabeth Hayn Acker 1992 243 p

Avail: Univ. Microfilms Order No. DA9239205

The goal of this research is to develop methods for representing and accessing knowledge to support multiple tasks. The goals of the research are threefold. The first goal is to develop an expressive and convenient frame-based language for representing domain knowledge so that it can

be applied to multiple tasks. A single comprehensive, fine grained representation of domain knowledge that can support a variety of applications is more flexible and cost-effective than several special-purpose knowledge bases. The second goal of the research is to make users of a knowledge base less dependent on the particulars of how knowledge is represented. This is achieved by providing a content addressable knowledge base and by providing access to concepts in the virtual knowledge base. Users can access frames in the knowledge base by description as well as by name, regardless of whether they exist explicitly or implicitly in the knowledge base. The third goal of the research is to develop computational methods for accessing from a knowledge base coherent portions of knowledge about a given concept (called viewpoints of concepts). Viewpoints are essential for a variety of tasks, including explanation generation, compositional modeling, problem solving, and machine learning. This research identifies several types of viewpoints and develops methods for constructing viewpoints of each type. Evaluation suggests that the viewpoints generated by these methods are comparable in coherence to human-generated viewpoints. Dissert. Abstr.

AN OBJECT-ORIENTED DATABASE APPROACH TO THE STORAGE AND USE OF MEDICAL DATA Ph.D. Thesis
Raymond David Frost 1992 257 p
Avail: Univ. Microfilms Order No. DA9239656

An object oriented database was constructed in order to aid in the diagnosis and treatment of patients with aphasia. A relational database was also constructed for comparison purposes. The two models were compared on several dimensions in order to illustrate the advantages available in the object oriented implementation. These advantages include support for embedded procedures, inheritance, complex objects and abstract data types. The object oriented implementation was also shown to provide greater data integrity brought about by a tighter coupling of data and procedures. The system chosen for the object oriented implementation was the Postgres Next Generation Database Management System. An argument was made for the adoption of an object oriented database management system for further research on computerization of the medical record. Dissert. Abstr.

PERFORMANCE PREDICTION OF RELATIONAL DATABASE MANAGEMENT SYSTEMS Ph.D. Thesis
William Francis Hyslop 1991 265 p
(ISBN-0-315-69232-4) Avail: Univ. Microfilms Order No. DANN69232

Although relational data base management systems are widely used in commercial applications, the performance of these systems is not yet fully understood. It is the intent of this thesis to develop a comprehensive analytical model of relational database systems capable of predicting their performance. MOSES, a multi-layered model will provide a means of quantitative evaluation of design decisions at various levels within the database design process. Also the interdependencies of design decisions may be studied. As a basis, the model integrates the best concepts from existing performance prediction models. The model is then extended to account for some important factors not included in prior models. These additions to the model include the effects of locking, recovery activities, the relational optimizer and executing transactions on diverse hardware architectures. An easy to use, menu-driven prototype tool, called JOSHUA, is developed which implements the proposed model and provides a means for validating the model. The predictions of the model are compared against observations obtained from operational database environments, including both a traditional mainframe DBMS and a multi-micro database machine. Dissert. Abstr.

COORDINATING COUNCIL. FIRST MEETING: NASA/RECON DATABASE
23 May 1990 3 p Meeting held in Washington, DC, 23 May 1990
(NASA-TM-108766; NAS 1.15:108766) Avail: CASI HC A01/MF A01

A Council of NASA Headquarters, American Institute of Aeronautics and Astronautics (AIAA), and the NASA Scientific and Technical Information (STI) Facility management met (1) to review and discuss issues of NASA concern, and (2) to promote new and better ways to collect and disseminate scientific and technical information. Topics mentioned for study and discussion at subsequent meetings included the pros and cons of transferring the NASA/RECON database to the commercial sector, the quality of the database, and developing ways to increase foreign acquisitions. The input systems at AIAA and the STI Facility were described. Also discussed were the proposed RECON II retrieval system, the transmittal of document orders received by the Facility and sent to AIAA, and the handling of multimedia input by the Departments of Defense and Commerce. A second meeting was scheduled for six weeks later to discuss database quality and international foreign input. CASI

COMPARISON OF FOUR-CURSOR BUTTONS VERSUS JOYSTICK TO ACCESS COMPUTERIZED TECHNICAL INFORMATION FROM AN INTEGRATED MAINTENANCE INFORMATION SYSTEM M.S. Thesis
Gerald E. Streff and Robert H. Gundel Sep. 1992 119 p
(AD-A259967; AFIT/GLM/LSY-92S-20) Avail: CASI HC A06/MF A02

The purpose of this thesis was to evaluate the use of four-cursor buttons versus a joystick device to present technical order information on a portable maintenance aid computer for aircraft technicians in a maintenance environment. Studies to date have verified the superiority of computer-presented technical orders when compared to current paper-based systems; this research investigated the effectiveness of these computer-based systems when technicians used a joystick or four-cursor button to display desired technical information. A comparison was made as to technician performance using a portable maintenance aid at the 4950th Test Wing, WPAFB OH. A total of thirty-two maintenance technicians accessed and displayed technical information using a joystick device and the four-cursor keys. Results indicated no statistically significant difference in the performance of maintenance technicians when using either access device in a controlled environment. The major conclusion was that either access device may be a viable answer for use in the flight line environment. The chief recommendation is that further studies be performed using a different joystick device and computer software that supports the eight joystick functions. GRA

CONDITION MONITORING IN AN ACTIVE DEDUCTIVE DATABASE Ph.D. Thesis
John Vincent Harrison 1992 219 p
Avail: Univ. Microfilms Order No. DA9237260

An 'active' database management system (DBMS) is characterized by its ability to automatically monitor user-defined conditions and react when the conditions become satisfied. In a conventional DBMS, queries and transactions are executed only when explicitly requested by a user or application program. Certain applications, such as those that require timely responses to changes in the database state, are not well served by a traditional, passive DBMS. Conditions identify database states, or state transitions, that are of interest to the user. The use of a logical language to represent these conditions increases the sophistication of an active database since it allows for more expressive conditions, which can represent a larger scope of real-world situations. This dissertation presents a condition monitor for conditions expressed using safe, recursive Datalog with stratified negation. Initially, an approach to condition monitoring that is based on incremental change theory, which was developed for the HiPAC active database system, is corrected and applied to this problem. Next, a more powerful approach, termed Propagation/Filtration (PF), is developed that is based on update propagation. An enhanced recursive query evaluation strategy based on both resolution, and memoing, is developed for use with the PF algorithm. The enhancement exploits mutually recursive

equivalence classes when negation is present. A prototype of the condition monitor is implemented to demonstrate its ability to monitor conditions defined in terms of linear and non-linear recursion. Optimizations are given that eliminate redundant and irrelevant computation. These optimizations utilize memoing, sideways-information-passing, strategies, multiple query optimization, partial evaluation and select program characteristics. Each optimization is implemented in the prototype to demonstrate the performance increase achieved. Active services include alerters, triggers and integrity constraints. These services can be used to elegantly support a variety of other database functions including materialized view maintenance and database security. The condition monitor described in this dissertation provides support for active services in a deductive database and represents a practical application of deductive database technology. Dissert. Abstr.

PARALLEL EVALUATION OF DEDUCTIVE DATABASE QUERIES Ph.D. Thesis
Sumit Ganguly 1992 185 p
Avail: Univ. Microfilms Order No. DA9239257

In this dissertation, we are concerned with the parallel bottom-up evaluation of a subset of deductive database languages called Datalog. We present a family of parametric parallelization strategies for Datalog programs. Several algorithms that were independently proposed for the parallel computation of specific Datalog programs can be obtained by properly choosing the parameters. The choice of the parallelization parameters significantly influences some properties of the resulting parallel executions, such as interprocess communication and fragmentation of the database. We present an algorithm to determine the minimal logical connectivity of the communicating processors, given a choice of the parallelization parameters. We also investigate the converse of the above question; namely, given a Datalog program and a network of processors, is it possible to choose the parallelization parameters such that the resulting parallel execution can be mapped onto the network of processors? This question is similar in nature to the question of mapping numerical algorithms to a systolic array of processors. However, unlike numerical algorithms, Datalog programs display very little structure; for example, there is no notion of a loop index or an array index. It is therefore somewhat surprising that this question can be decided algorithmically for a very large class of Datalog programs. Given a particular database system, it is an interesting question to choose the parallel execution which results in minimum response time. Unfortunately, accurate cost models estimating the computational cost of recursive Datalog programs is not available. Hence, optimizing for the parallel execution of recursive Datalog programs is difficult. We thus restrict our attention to the problem of optimizing non-recursive Datalog programs for parallel executions. Our contributions to this problem domain are: (1) Presentation of a clear execution space and cost model that models data dependency, independent parallelism and pipelined parallelism. (2) The observation that dynamic programming search strategies need to be executed to use partial order; that is, plans must be compared simultaneously along different dimensions. We show how such metrics may be designed within our model. (3) An initial investigation into modeling resource usage on two different architecture. We propose that inherent symmetry of systems should be used to decrease the dimensions of the search. Dissert. Abstr.

EXECUTIVE SUMMARY OF INFORMATION SYSTEMS PLANS: FISCAL YEARS 1994 TO 1998
Dec. 1992 110 p
(PB93-146330) Avail: CASI HC A06/MF A02

The report is an overview of the major information systems that the Department of Treasury expects to implement and maintain during the next five years. The summary provides Treasury Bureaus, federal officials, and the public with information on strategic planning issues for the department. In addition, the document summarizes plans for the development and implementation of information systems that have not only departmental importance but national significance as well. In particular, three of the Treasury's major systems include ones designated by OMB as part of its Program for Priority Systems; these systems are the Internal Revenue Service's Tax Systems Modernization, the Financial Management Service's System 90, and the U.S. Customs Service's Interagency Border Inspection System. DATABASE MANAGEMENT SYSTEMS IN ENGINEERING
Katherine C. Morris, Mary Mitchell, Christopher Dabrowski, and Elizabeth Fong Dec. 1992 56 p
(PB93-138964; NISTIR-4987) Avail: CASI HC A04/MF A01

Until recently the applicability of database technology to engineering systems has been limited. Early database systems addressed large-scale data processing needs of easily automatable applications. These applications were characterized by very uniform data and well understood processing methods. Engineering applications on the other hand, are characterized by highly complex data with very variable structure. The need to represent engineering data has driven advances in database technology. Engineering domains also impose unique, new requirements on other aspects of database technology. In particular, to support the evolutionary nature of the engineering environment, recent developments in database technology have focused on the temporal dimensions of data management. In addition, the present trend in manufacturing towards concurrent engineering raises new considerations for the cooperative use of data in a distributed engineering environment. All of these factors are reflected in the new generation of database systems and are described in the article. GRA

THE IMPACT OF COMPUTER INSTRUCTION ON THE NEAR TRANSFER AND FAR TRANSFER OF A GENERAL PROBLEM-SOLVING STRATEGY Ph.D. Thesis
Beverly Gene Abbey 1992 95 p
Avail: Univ. Microfilms Order No. DA9300577

Hypotheses related to the transfer of a general problem solving strategy were tested in this study. A modified Solomon Four-Group design was used to control for threats to internal validity and to consider external validity factors. One-half of each of three intact groups of university students were given the Means-Ends Problem Solving pretest. Two of the groups received instruction on a means-ends problem solving strategy using Lemmings, a commercial game/simulation. One treatment group was instructed on the computer; one group was instructed by a classroom teacher. Near transfer was assessed 1 week later using additional levels of increasing difficulty from Lemmings. The computer group was presented the transfer tasks on the computer; the classroom group was presented paper-and-pencil tasks using screen prints from Lemmings. One week after the near transfer tasks, far transfer was assessed using an alternate portion of the Means-Ends Problem Solving procedure. Results indicated a significant difference in relevancy gain scores on the far transfer posttest between the treatment groups and the control group (p less than .0001). No significant difference was found in far transfer relevancy scores between the two treatment groups. No significant difference was found in the near transfer relevancy scores between the treatment groups, but there was a significant difference in the number of correct solutions (P less than .05). The classroom instructed group successfully solved more levels. It appears that the ability to transfer a general problem solving heuristic within a domain and across domains can be profoundly improved. A computer can be effectively used to improve transfer across domains. Dissert. Abstr.

KNOWLEDGE-BASED SYSTEMS FOR COMPUTATIONAL CONTROL Final Report, 1 Jul. 1989 - 30 Jun. 1992
Robert F. Stengel Nov. 1992 12 p
(Contract DAAL03-89-K-0092)
(AD-A260409; MAE-1963; ARO-25264.23-MA) Avail: CASI HC A03/MF A01

New tools for control system design were created and 'pathfinders' for implementing new design principles in operational control systems were established. Four topics were addressed in the subject project: neural networks for system modeling and nonlinear control; stochastic robustness of control systems; computer-aided control system design; and optimal rule-based guidance for autonomous vehicles. The principal result of the first task is the development of a new method for training neural networks using extended Kalman filtering to match not only multivariate functions but the gradients of their surfaces. The principal result of the second task is the development of a powerful new method for characterizing the robustness of control systems and for designing controllers with satisfactory

stability and performance robustness. The principal result of the third task is the identification of a new computational structure for multidisciplinary control system design. The principal result of the fourth task is a new approach for designing real-time rule-based controllers that can operate in uncertain environments, with particular application to the guidance of vehicles on a roadway with traffic. INTELLIGENT INFORMATION RETRIEVAL FOR A MULTIMEDIA DATABASE USING CAPTIONS Ph.D. Thesis
Eugene J. Guglielmo 23 Jul. 1992 370 p
(AD-A260438) Avail: CASI HC A16/MF A03

An intelligent information retrieval system, MARIE, that employs natural language processing techniques for indexing and retrieving multimedia data is described. Captions describe photographs from the Naval Air Warfare Center Weapons Division, China Lake, California; the captions were written in English consisting mostly of noun phrases. For our work, an object-oriented type hierarchy represents semantic knowledge. Captions are parsed to produce a logical form, from which nouns and verbs are extracted to form keyword files. User queries are also specified in natural language. A two-phase match process is employed between the query and database. A coarse-grain match searches the keyword files and issues SQL queries to a relational database as necessary to find candidate captions for further analysis. A fine-grain match then compares the logical form of the query to the logical form for each caption. A list of caption ID's and accompanying match scores is then presented to the user, who can view the image and supporting data. A companion technical report contains the programs for the system discussed here. GRA

MODERNIZATION AND UNIFICATION: STRATEGIC GOALS FOR NASA STI PROGRAM
W. Blados and G. Cotter Apr. 1993 16 p
(NASA-TM-109186; NAS 1.26:109186) Avail: CASI HC A03/MF A01

Information is increasingly becoming a strategic resource in all societies and economies. The NASA Scientific and Technical Information (STI) Program has initiated a modernization program to address the strategic importance and changing characteristics of information. This modernization effort applies new technology to current processes to provide near-term benefits to the user. At the same time, we are developing a long-term modernization strategy designed to transition the program to a multimedia, global 'library without walls.' Notwithstanding this modernization program, it is recognized that no one information center can hope to collect all the relevant data. We see information and information systems changing and becoming more international in scope. We are finding that many nations are expending resources on national systems which duplicate each other. At the same time that this duplication exists, many useful sources of aerospace information are not being collected because of resource limitations. If nations cooperate to develop an international aerospace information system, resources can be used efficiently to cover expanded sources of information. We must consider forming a coalition to collect and provide access to disparate, multidisciplinary sources of information, and to develop standardized tools for documenting and manipulating this data and information. In view of recent technological developments in information science and technology, as well as the reality of scarce resources in all nations, it is time to explore the mutually beneficial possibilities offered by cooperation and international resource sharing. International resources need to be mobilized in a coordinated manner to move us towards this goal. This paper reviews the NASA modernization program and raises for consideration new possibilities for unification of the various aerospace database efforts toward a cooperative international aerospace database initiative that can optimize the cost/benefit equation for all participants. ARCHITECTURE FOR HUMAN-COMPUTER DESIGN, MANAGEMENT AND COORDINATION IN A COLLABORATIVE AEC ENVIRONMENT Ph.D. Thesis
Hossam El-Din El-Bibany 1992 125 p
Avail: Univ. Microfilms Order No. DA9234092

A collaborative information system must fit the market, the organization, the culture, and the norms of the group it supports. In the Architecture/Engineering/Construction (AEC) industry, a computer-based framework for collaboration needs to consider issues such as its application suitability in various project organizations, and the ability to operate under partial knowledge. A formal Collaborative Knowledge-integration Systems (CKiS) methodology for integrating multidisciplinary knowledge, and building and managing the dynamic data-dependency structures based on the integrated knowledge is described. The methodology forms the core of an AEC collaboration framework and the corresponding computer system architecture. The architecture facilitates integrated design and project management in a flexible methodology that accommodates the various tasks required to create the product (facility) under a unified representation and inference. The unified methodology serves as the basis for interdisciplinary knowledge integration. On the project data level, the integrated knowledge forms and maintains dynamic data-dependency structures that react to and update with changes in data items in any direction. The data-dependency structures represent the causal relationships among data items and have the ability to handle unanticipated situations, provide a formal way to construct and maintain the knowledge (and data) base, and provide a universal medium for understanding (through causal explanation) the functioning of a system. The human-computer architecture builds on constraint-management techniques. Low-level parametric models represent the structure and behavior of, and the relationship between, various project entities in a standard representational model. The architecture handles parametric as well as boolean constraints in a standard integrated representation and inference mechanism. A sophisticated constraint-management methodology coupled with interval-based mathematics is the basis for domain modeling, models' integration, and the quantitative and qualitative inference capabilities of the architecture. Elements of the architecture follow representation standards. Based on these standards, the architecture may be considered as shell for both domain modeling and project design, management, and coordination. The shell may be employed in different domains under different organizational requirements. Dissert. Abstr.

ASSIGNING SITES TO REDUNDANT CLUSTERS IN A DISTRIBUTED STORAGE SYSTEM
Antoine N. Mourad, W. K. Fuchs, and Daniel G. Saab 1992 23 p
(Contract N00014-91-J-1283)
(AD-A260458) Avail: CASI HC A03/MF A01

Redundant Arrays of Distributed Disks (RADD) can be used in a distributed computing system or database system to provide recovery in the presence of disk crashes and temporary and permanent failures of single sites. In this paper, we look at the problem of partitioning the sites of a distributed storage system into redundant arrays in such a way that the communication costs for maintaining the parity information are minimized. We show that the partitioning problem is NP-hard. We then propose and evaluate several heuristic algorithms for finding approximate solutions. Simulation results show that significant reduction in remote parity update costs can be achieved by optimizing the site partitioning scheme. GRA

Carol L. Dowling, ed. and Thor Lehnert, ed. Jan. 1992 215 p
(PB93-152650) Avail: CASI HC A10/MF A03

The Indexing Branch of the National Agricultural Library and its cooperators currently index 2,012 journals for AGRICOLA (Agricultural On Line Access), the Library's bibliographic database. AGRICOLA contains records for agricultural literature citations of journal articles, monographs,

theses, patents, software, audiovisual materials, and technical reports. Indexing records comprise approximately 85 percent of the AGRICOLA database, the remaining 15 percent being cataloging records. The List of Journals Indexed in AGRICOLA 1992 contains a new section for titles which have abstracts included in the AGRICOLA record. As in previous editions, a listing of journal titles that have been added for indexing in the past year and a listing of previously indexed titles that are no longer indexed are included. Also included are an alphabetized abbreviated title listing of journals indexed and a subject listing. In the subject listing, journals are categorized based on both the topic of the journal and the types of articles that are indexed for AGRICOLA. GRA

The grand challenge problems of science and industry that are driving computing and communications have created corresponding challenges in information storage and retrieval. An industry-led collaborative project has been organized to investigate technology for storage systems that will be the future repositories for our national information assets. Industry participants are IBM Federal Systems Company, Ampex Recording Systems Division, General Atomics DISCOS Division, IBM Storage Systems Products Division, Maximum Strategy Corporation, Network Systems Corporation, and Zitel Corporation. Industry members of the collaborative project are funding their own participation. Lawrence Livermore National Laboratory through its National Energy Research Supercomputer Center (NERSC) will participate in the project as the operational site and the provider of applications. The expected result is the creation of a National Storage Laboratory to serve as a prototype and demonstration facility. It is expected that this prototype will represent a significant advance in the technology for distributed storage systems capable of handling gigabit class files at gigabit per second data rates. Specifically, the collaboration expects to make significant advances in hardware, software, and systems technology in the four areas of need that are identified in this paper, which are (1) network-attached high performance storage; (2) multiple, dynamic, distributed storage hierarchies; (3) layered access to storage system services; and (4) storage system management. MACHINE-ASSISTED HUMAN CLASSIFICATION OF SEGMENTED CHARACTERS FOR OPTICAL CHARACTER RECOGNITION TESTING AND TRAINING
R. A. Wilkinson, M. D. Garris, and J. Geist Dec. 1992 14 p
(PB93-152155; NISTIR-5105) Avail: CASI HC A03/MF A01

The National Institute of Standards and Technology (NIST) needed a large set of segmented characters for use as a test set for the First Census Optical Character Recognition (OCR) Systems Conference. A machine assisted human classification system was developed to expedite the process. The testing set consists of 58,000 digits and 10,000 upper and lower case characters entered on forms by high school students and is distributed as Testdata 1. A machine system was able to recognize a majority of the characters but all system decisions required human verification. The NIST recognition system was augmented with human verification to produce the testing database. The augmented system consists of several parts: the recognition system; a checking pass; a correcting pass; and a clean up pass. The recognition system was developed at NIST. The checking pass verifies that an image is in the correct class. The correcting pass allows classes to be changed. The clean-up pass forces the system to stabilize by accepting images with verified classifications while rejecting all others. In developing the testing set the authors discovered that segmented characters can be ambiguous even without context bias. The ambiguity can be caused by over-segmentation or by the way a person writes. This means that a quoted accuracy rate for a set of segmented characters is meaningless without reference to human performance on the same set of characters. GRA

83 ECONOMICS AND COST ANALYSIS

Includes cost effectiveness studies.

N93-22404# General Accounting Office, Washington, DC. National Security and International Affairs Div.
SPACE PROGRAMS: NASA'S INDEPENDENT COST ESTIMATING CAPABILITY NEEDS IMPROVEMENT
Nov. 1992 9 p
(AD-A259263; GAO/NSIAD-93-73) Avail: CASI HC A02/MF A01

This report responds to a request that we determine whether NASA implemented an advisory committee's recommendation to strengthen NASA's independent cost estimating capability. Congress and the executive branch need accurate cost estimates in deciding whether to undertake or continue space programs which often cost millions or even billions of dollars. In Dec. 1990, the Advisory Committee on the Future of the US Space Program found that initial estimates of required resources too often have been understated. The committee recommended that NASA establish an independent cost analysis group to advise the administrator on estimates being provided to Congress and the Office of Management and Budget.

SUMMARY OF ACTIVITIES OF THE LIFE CYCLE COSTING WORKSHOP CONDUCTED BY THE ENVIRONMENTAL RESTORATION PROGRAM OF OAK RIDGE NATIONAL LABORATORY
Aug. 1992 265 p Presented at the Life Cycle Costing Workshop, Oak Ridge, TN, 14-18 Oct. 1992
(Contract DE-AC05-84OR-21400)
(DE93-000823; ORNL/ER-117; CONF-9110457-Summ) Avail: CASI HC A12/MF A03

A five-day life cycle workshop was conducted by the Environmental Restoration (ER) Program of Oak Ridge National Laboratory (ORNL) to develop appropriate remediation scenarios for each Waste Area Grouping (WAG) at ORNL and to identify associated data needs (e.g., remedial investigations, special studies, and technology demonstrations) and required interfaces. Workshop participants represented the Department of Energy, Martin Marietta Energy Systems, Inc., Bechtel National, Radian Corporation, EBASCO Corporation, and M-K Ferguson. The workshop was used to establish a technical basis for remediation activities at each WAG. The workshop results are documented and provide the baseline for estimating the technical scope for each WAG. The scope and associated budgets and schedules will be summarized in baseline reports for each WAG, which, in turn, will be compiled into an overall strategy document for ORNL ER.

SPACE TRANSPORTATION: THE CONTENT AND USES OF SHUTTLE COST ESTIMATES. REPORT TO THE CHAIRMAN, SUBCOMMITTEE ON INVESTIGATIONS AND OVERSIGHT, COMMITTEE ON SCIENCE, SPACE, AND TECHNOLOGY, HOUSE OF REPRESENTATIVES
Jan. 1993 15 p
(GAO/NSIAD-93-115; B-251737) Avail: CASI HC A03/MF A01; GAO, PO Box 6015, Gaithersburg, MD 20877 HC

This report responds to the former Chairman's request that we review the National Aeronautics and Space Administration's (NASA) estimates of the Space Shuttle's average cost per flight and marginal cost per flight. The Congress needs to understand the content of these estimates to avoid confusion over what it costs to fly the shuttle. Our specific objectives

were to determine (1) what costs are included in or excluded from each estimate and (2) how these costs should be allocated to NASA payload missions that are transported to space in the shuttle. Derived from text

POST COLD WAR ASSESSMENT OF US SPACE POLICY: A TASK GROUP REPORT
Dec. 1992 80 p
(PB93-139962) Avail: CASI HC A05/MF A01

On August 31, 1992 a special task group of the Space Policy Advisory Board reviewed the nation's space policies in the context of the end of the Cold War and other developments. The report focuses on four recommendations. They are that: (1) major changes be made in the way government space activities are organized and managed, eliminating duplication and fostering synergism among civil, military, intelligence, and commercial space programs; (2) the government seek to reduce, and where possible eliminate, security constraints associated with national security space programs; (3) the government take a series of actions on an urgent basis to create a more cooperative and productive relationship with the U.S. space industry; and (4) the United States take the initiative in shaping a common international agenda in selected areas of civilian and national security space activity to address global problems and to maintain U.S. influence. HIGH SPEED GROUND TRANSPORTATION STUDY: EXECUTIVE SUMMARY
Oct. 1992 33 p
(PB93-141091) Avail: CASI HC A03/MF A01

In 1991, the Washington State Legislature enacted Chapter 231, Laws of 1991 (SHB 1452), which directed that a comprehensive assessment be made of the feasibility of developing a high speed ground transportation (HSGT) system in Washington state. The legislation came about because there was a growing recognition that major transportation corridors were reaching unacceptable levels of congestion, and that even though most large metropolitan areas were developing specific plans to ease that congestion within their urban boundaries, inter-city travel between those areas was becoming increasingly difficult. The study area included Washington plus the Portland, Oregon urban area and the lower mainland of British Columbia. Two major corridors were identified and analyzed. The study was not meant to focus on the technologies but rather on the economic, environmental, institutional, and financial feasibility of implementing HSGT in this state. The study was not meant to be a 'siting' study. Alignments and station locations were assumed only to test feasibility, and to evaluate corridors and service areas. Specific location decisions will require more detailed engineering and operations studies. GRA

88 SPACE SCIENCES (GENERAL)

N93-23878# European Space Agency, Paris (France).
ENVIRONMENT OBSERVATION AND CLIMATE MODELLING THROUGH INTERNATIONAL SPACE PROJECTS. SPACE SCIENCES WITH PARTICULAR EMPHASIS ON HIGH-ENERGY ASTROPHYSICS
T. Duc Guyenne, ed. and James J. Hunt, ed. Jul. 1992 218 p Conference held in Munich, Germany, 30 Mar. - 4 Apr. 1992; sponsored by CEC, ESA, Deutsche Agentur fuer Raumfahrtangelegenheiten, and the European Association for the International Space Year
(ESA-ISY-3; ETN-93-93506) Copyright Avail: CASI HC A10/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The European International Space Year conference was held with the specific theme of the practical use of space derived information for environmental research and monitoring, and resource management. The main theme, 'Mission to Planet Earth', was maintained, but it was recognized that other fields needed to be equally addressed to provide a balanced view on space activities. Space sciences, space navigation and communications, and manned space activities were also represented. The present volume consists of papers addressing in particular infrared, gamma ray, and spaceborne astronomy. Several reports relate to the Rosat X-ray astronomy satellite. Other missions covered include Hipparcos, the Hubble Space Telescope and FIRST (Far Infrared and Submillimeter Telescope). Solar studies and planetary exploration are also reported. For individual titles, see N93-23879 through N93-23934.

STATUS AND EARLY RESULTS OF THE HIPPARCOS ASTROMETRY PROJECT **c90**
L. Lindegren *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Space Sciences with Particular Emphasis on High-Energy Astrophysics Jul. 1992 p 3-8 (For primary document see N93-23878 08-88)
Copyright Avail: CASI HC A02/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

A report on the status and early results of the ESA astrometry mission Hipparcos, launched in 1989, which aims at the construction of a uniquely accurate and uniform catalog of positions, parallaxes, proper motions and photometric information for 118,000 preselected program stars, is presented. Additional data for up to a million stars will be obtained by the Tycho part of the mission. The first results of the lengthy catalog construction process are available in the three data reduction consortia. The early (and provisional) star positions and distance estimates give a dramatic indication of the outstanding scientifc potential of the mission. In spite of the many difficulties and losses caused by a faulty orbit it is now expected that the nominal goal of 2 milliarcsec accuracy (for typical stars) will be reached around 1993.0 and even surpassed for a longer mission. ESA

The Rosat X-ray astronomy satellite has completed the first all sky X-ray and XUV survey with imaging telescopes. About 60,000 new X-ray and 400 new XUV sources were detected. Preliminary results from the Rosat All Sky X-ray Survey are addressed. The Rosat X-ray Skymap, the positional accuracy obtained for the X-ray sources, general information on their properties, and first results from correlations performed with available catalogs in various energy bands like the radio, infrared, visible, UV, and hard X-rays as well as identifications from optical follow up observations are presented. The hard X-rays, low energy gamma ray telescope SIGMA, one of the main instruments on board the Soviet satellite GRANAT, has performed sky observations in the 35 keV to 1.3 MeV range, both in galactic and extragalactic sources with unprecedent angular resolution in such an energy domain. New results were obtained by imaging the Galactic center region with a 1.5 arc minute accuracy during more than 400 hours distributed in five periods which took place in early Spring and Summer from 1990 to 1992. The 6 by 6 deg region centered on the Galactic center contains more than six highly variable sources in the 100 keV domain. Hard X-ray binaries and bright extragalactic objects were also analyzed and monitored during these observations. The main result obtained by SIGMA was to point out the variability of the sky in the hard X-ray domain. ESA

ENDPOINTS OF STELLAR EVOLUTION: THE INCIDENCE OF STELLAR MASS BLACK HOLES IN THE GALAXY **c90**
Edward P. J. vandenHeuvel *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Space Sciences with Particular Emphasis on High-Energy Astrophysics Jul. 1992 p 29-36 (For primary document see N93-23878 08-88)
Copyright Avail: CASI HC A02/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The various possible endpoints of stellar evolution are discussed. Special consideration is given to the question of the number of stellar mass black holes present in the galaxy. From stellar evolution considerations together with the incidence of Low Mass X-ray Binaries that contain black holes it is argued that the number of stellar mass (approximately 5 to 15 solar mass) black holes in the Galaxy must be of order 10 to eighth power. Even if all helium in the Universe had been made in an early population of very massive stars, the number of stellar mass black holes in the Galaxy would not exceed 6 times 10 to the 9th power. ESA

GRAVITATIONAL LENSES **c89**
Sjur Refsdal *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Space Sciences with Particular Emphasis on High-Energy Astrophysics Jul. 1992 p 37-40 (For primary document see N93-23878 08-88)
Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The observed microlensing variability of QSO 2237+0305 has already given important information in the structure of the quasar, the mass of the stars which causes the microlensing, and the transverse motions involved. A discussion on how more precise information can be obtained if observations can also be carried out from a space observatory some astronomical units away from the Earth, since in this case the spatial gradient of the observed flux can be measured, is presented. The inclusion of a telescope (greater than or equal to 20 cm) for such observations in a future space mission is proposed. ESA

Spectrally resolved X-ray images of galactic Supernova Remnants (SNR) were obtained both from the Rosat All Sky Survey and a series of pointed observations. There is substantial evidence for significant spatial variation in temperature, density and pressure across the older, thermal remnants like the Vela SNR, the Cygnus Loop and the North Polar Spur. Both the brightness distribution and the pressure variations observed point towards recently shocked interstellar clouds and filaments, which dominate the X-ray emission pattern. Across the Puppis-A SNR an arc shaped absorption structure was detected, which is interpreted as cold gas located close to the shock front of the Vela SNR. ESA

A review on ESA's science program is presented. Five missions still in orbit are outlined: IUE, Giotto, Hipparcos, Hubble Space Telescope, and Ulysses. Objectives of the Horizon 2000 program are described. Solar system exploration in Horizon 2000 concerns: the SOHO (Solar and Heliospheric Observatory) and Cluster missions, Cassini/Huygens to Saturn and Titan, and the Rosetta Comet Nucleus Sample Return (CNSR). Astronomy in Horizon 2000 concerns ISO (Infrared Space Observatory), the X-ray Multimirror Mission (XMM) and FIRST (Far Infrared and Submillimeter Space Telescope). Medium sized missions of Horizon 2000 include INTEGRAL (International Gamma Ray Astrophysical Laboratory), MARSNET (a network of lander modules in Mars), and STEP (Satellite Test of the (weak) Equivalent Principle). Small missions include extension of Giotto and instruments to fly on Eureca, the Columbus Space Station, and the Polar Platform. ESA

The extension of the energy output from Active Galactic Nuclei (AGN) throughout the whole electromagnetic spectrum is addressed. The relevance of space observations for the understanding of this phenomenon is illustrated by describing some of the results obtained with Exosat and Ginga on their X-ray emission. In particular spectral properties and variability are reviewed along with their most immediate implications for model pictures of AGN. ESA

Rosat all sky survey data of the brightest clusters of galaxies, like Virgo, Perseus, and Coma, are presented. These observations reveal new information on the dynamical state of the galaxy clusters. Coma, for example, the archetype of a relaxed virialized cluster shows clear evidence for substructure: a concentration of galaxies, found already on the optical, is in fact a physical object and appears to be in the process of merging with the cluster. In pointed observations of clusters of galaxies substructure becomes even more evident. A2256, a Coma like cluster, is the first object in which the merging of a group and a cluster of galaxies was found. In addition, long pointed observations enable us to measure for the first time an azimuthally averaged temperature distribution, as will be shown for A2256. These data can be used to determine the distribution of dark matter in the cluster and to measure its mass. ESA

Detailed studies of the X-ray spectra of well known Active Galactic Nuclei (AGN) from different object classes are reported. It was found that there are no indications in the spectra of BL Lac objects of low energy absorption due to cold and dense material in their X-ray emitting regions. On the other hand, absorption line features were found below 1 keV indicating the probable existence of highly ionized matter in these objects. The convex (0.1 to 20) keV spectrum of MKN 421 is presented, which was obtained by combining the data simultaneously measured with Rosat and Ginga in a single fit. As examples for X-ray spectra of bright AGN, those of archetypal Quasi Stellar Objects (QSOs) are presented, the radio loud quasar 3C 273 and the radio quiet QSO 1821 + 64, respectively, both of which exhibit variable soft X-ray excesses. ESA

SOLAR SYSTEM OBSERVATIONS WITH HST **c89**
Francesco Paresce (European Space Agency, Paris, France.) and Jean-Claude Gerard (Liege Univ., Belgium.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Space Sciences with Particular Emphasis on High-Energy Astrophysics Jul. 1992 p 91-94 (For primary document see N93-23878 08-88)
Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Imaging and spectrographic measurements of solar system objects with the Hubble Space Telescope (HST) are reviewed from a scientific and technical standpoint. Special emphasis is placed on observations of Jupiter and Io during the Ulysses encounter by the Faint Object Camera and HRS. The bottom line is that, although the mirror aberration limits HST's extragalactic performance, the potential for a deep systematic probe of planetary conditions over a wide range of observing conditions is still practically intact and will get better as the bugs are ironed out and the COSTAR (Corrective Optics Space Telescope Axial Replacement) fix is implemented. Progress on the space exploration of solar system objects is discussed. Terrestrial planets have been extensively studied for twenty years using orbiters and descent probes which allowed in situ measurements of their atmospheres (Mariner, Viking, Venera spacecrafts). The atmospheres of the giant planets and their satellites have been investigated by fly-by missions (Pioneer and Voyager) which could perform remote sensing observations (imaging and spectroscopy). Future plans include the long term exploration of Mars and the extended exploration of the Jovian and Saturnian systems. ESA

The Hopkins Ultraviolet Telescope (HUT), flown aboard the Space Shuttle Columbia in the Astro-1 mission, provided the first spectrophotometry in the sub Kyman alpha region for many astronomical sources. Observations of 77 sources were made throughout the far ultraviolet (912 to 1850 A, delta lambda approximately 3 A), and for a few objects in the extreme ultraviolet (415 to 912 A, delta lambda approximately 1.5 A). Among the objects observed were quasars, galaxy clusters, active and normal galaxies, cataclysmic variables, globular clusters, supernova remnants, planetary nebulae, and white dwarfs. ESA

A series of 32 deep pointed observations with the Rosat PSPC (Position Sensitive Proportional Counter) is discussed. Nine hundred fifty-five X-ray sources with 0.5 to 2 keV fluxes down to 3 x 10(exp -15) erg/sq cm(s) were discovered in 9.8 deg(exp 2). The N(greater than S) relation of the sources selected in the 0.5 to 2 keV band shows a density in excess of approximately 250/deg squared at the faintest fluxes and a flattening below 2 x 10(exp -14) erg/sq cm(s). The average spectrum of those sources is a power law with energy index 1.09 +/- 0.07. The absorption column densities are consistent with the galactic H 1 columns. More than 50 percent of the 1 to 2 keV background was resolved into discrete sources in the deepest fields. The total background spectrum shows an emission line feature around 0.65 keV, most probably due to O7-O8 from a 2,000,000 plasma. Above approximately 1 keV the background is dominated by a power law spectrum with a normalization of 13.6 +/- 0.2 KeV/sq cm/(s)(sr)(keV) and a slope 1.04 +/- 0.06, i.e. considerably steeper than the extrapolation from higher energies. Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The properties of gamma ray bursts of classical type are found to be explicable in terms of high speed collisions between stars. A model is proposed in which the frequency of such collisions can be calculated. The model is then applied to the nuclei of galaxies in general on the basis that galaxies, or at least some fraction of them, originate in the expulsion of stars from creation centers. Evidence that low level activity of this kind is also taking place at the center of our own Galaxy is discussed. The implications for galactic evolution are discussed and a negative view of black holes is taken. ESA

ARCHIVAL AND ANALYSIS OF HUBBLE SPACE TELESCOPE DATA **c89**

R. Albrecht (European Space Agency. European Space Research and Technology Center, ESTEC, Noordwijk, Netherlands.), F. Pasian, and B. Pirenne *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Space Sciences with Particular Emphasis on High-Energy Astrophysics Jul. 1992 p 127-131 (For primary document see N93-23878 08-88)

Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The experiences gained during the operation of the archival/data analysis system, after almost two years of orbital operations of the Hubble Space Telescope (HST), are described with particular emphasis on system operation in an internationally networked, multisystem, academic environment, which has, at least in some areas, industry type development, interface, reliability, security, and throughput requirements imposed on it. The data analysis system resides on a network of distributed processors, running mostly UNIX machines. Since HST data are worked on worldwide with many different software systems, the user community is provided with the most important systems in which HST data analysis and calibration software has been written: STSDAS (Space Telescope Science Data Analysis System) and IDL (Interactive Data Language). DATA ANALYSIS AND ARCHIVES IN ASTRONOMY: A PERSPECTIVE VIEW **c89**

B. Benvenuti (European Space Agency. European Space Research and Technology Center, ESTEC, Noordwijk, Netherlands.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Space Sciences with Particular Emphasis on High-Energy Astrophysics Jul. 1992 p 137-138 (For primary document see N93-23878 08-88)

Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

An overview of the data analysis and archiving of astronomical observations is presented. A key factor for a proper analysis of the situation is the average time interval for the obsolescence or renewal of hardware configurations and software tools. The development of interactive data analysis programs and systems over the last 15 years and problems related

to portability and adaptability of software are reviewed. The use of workstations designed to be installed and run by individuals rather than by 'computer centers' means that the astronomer must often become the computer manager. A critical review of medium to long term plans is required. ESA

X RAY SPECTRAL STRUCTURE OF THE SEYFERT 2 GALAXY NGC 5506 **c89**

I. A. Bond, M. Matsuoka, and M. Yamauchi *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Space Sciences with Particular Emphasis on High-Energy Astrophysics Jul. 1992 p 141-142 (For primary document see N93-23878 08-88)

Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Observations of the Seyfert 2 galaxy NGC5506 by Ginga from 6-10 Jul. 1991 are discussed. The spectrum obtained on 9 Jul. was found to be consideraby softer below 3 keV compared with the other observation days. The spectra are each best described by a composite partial covering model and reflection model. While the presence of ionized matter is not ruled out, the lack of correlation of the spectral softness with the continuum flux rules out models based on photoionization as the softness variability mechanism. In reality the soft excess seen in NGC 5506 is probably complex and comprises several components. ESA

EXTRAGALACTIC RADIO SOURCES IN THE ROSAT SURVEY **c93**

W. Brinkmann, T. Boller, and J. Siebert *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Space Sciences with Particular Emphasis on High-Energy Astrophysics Jul. 1992 p 143-144 (For primary document see N93-23878 08-88)

Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The cross correlation of radio catalogs with the source list from the Rosat All Sky Survey yields a large number of mostly previously optically unidentified extragalactic objects. Amongst the 'known' sources the biggest subgroup is formed by quasars, followed by radio galaxies. From the correlations a total of more than 2500 radio X-ray sources is available for the statistical and morphological study of extragalactic objects. ESA

N93-23900# Landessternwarte auf dem Koenigstuhl, Heidelberg (Germany).

EMISSION FROM RELATIVISTIC JETS IN BLAZARS **c93**

M. Camenzind *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Space Sciences with Particular Emphasis on High-Energy Astrophysics Jul. 1992 p 145-146 (For primary document see N93-23878 08-88)

Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The relativistic jets observed in quasars and BL Lac objects are nothing else than magnetically collimated disk winds. On the parsec scale, the radius of these outflows is of the order of a few light cylinder radii for magnetic surfaces anchored near the inner edge of the accretion disk. The disk plasma is accelerated to Lorentz factors of approximately or equal to 10, depending on the magnetization of the disk. Relativistic motion of knots and variability in the emission from blazars are related to nonaxisymmetric bubbles carried along by the plasma in relativistic magnetized jets. The intense gamma radiation detected by GRO (Gamma Ray Observatory) in the direction of flat spectrum quasars and BL Lac objects is naturally explained in terms of inverse Compton emission from young knots ejected along the jet channel. HST IMAGING OF THE BINARY PULSAR PSR1913+16 **c89**

Philippe Crane *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Space Sciences with Particular Emphasis on High-Energy Astrophysics Jul. 1992 p 149-151 (For primary document see N93-23878 08-88)

Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

An image of the region of the binary pulsar PSR1913+16 obtained with the Planetary Camera on board the Hubble Space Telescope is presented and discussed. The image clearly shows the object previously thought to be coincident with the radio timing position of the pulsar. The astrometric solution confirms the positional coincidence. The object appears slightly elongated in both of the images obtained. If this object is indeed associated with the binary pulsar, then the clean interpretation of the timing data as evidence for gravitational radiation may be in doubt. ESA

ORFEUS (Orbital and Retrieval Far and Extreme Ultraviolet Spectrometer) is the first short term scientific space payload of the free flying and retrieval ASTRO-SPAS satellite scheduled to be launched in February 1993. The autonomous scientific mission is limited to 5-7 days. The main scientific objectives are cosmic targets with photospheric temperatures between 10,000 to 1,000,000 K. ORFEUS is a powerful combination of two alternatively operating spectrometers covering the far and extreme ultraviolet spectral range in a telescope with 4 m tube length and an aperture of 1000 mm. The required spectrometric high telescope resolution in the ultraviolet range (40 to 125 nm) exceeds the performance of previous comparable UV instruments by a factor of 30 and is opening a new window in the universe. More than 270 gamma ray bursts have been observed to date with the BATSE (Burst and Transient Source Experiment) aboard the Compton Gamma Ray Observatory. Many have a duration of 10 seconds or more and complex structure with multiple peaks or spikes. Complex bursts in the energy range 30 keV to 1 MeV were systematically analyzed to determine the relations between intensity and spectral shape, or hardness. The burst hardness rises and falls in during spikes, but somewhat earlier than the intensity. A simple correlation between intensity and hardness is, therefore, not observed: the intensity lags instead. Results from one burst which shows evidence for longer lags in longer spikes are reported. SOFT X RAY EMISSION FROM SUPERGIANT X RAY BINARIES DETECTED ON THE ROSAT ALL-SKY SURVEY c93
Frank Haberl, Tomaso Belloni, and Fotis Mavromatakis *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Space Sciences with Particular Emphasis on High-Energy Astrophysics Jul. 1992 p 163-164 (For primary document see N93-23878 08-88)
Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The supergiant x-ray binaries 4U 1700-37 and Vela X-1 were detected during the Rosat all sky survey with an average count rate of about 1 count/sec. The x-ray spectra can be fitted with a Bremsstrahlung model with a temperature of 0.5 keV. The x-ray spectrum in the Rosat PSPC (Position Sensitive Proportional Counter) band is consistent with the soft component seen during a Ginga observation of 4U 1700-37. The survey light curve for both sources indicate an eclipse of the soft component which continues after eclipse egress of the hard x-ray source. The low absorption of the soft component suggests that it originated far out in the stellar wind. ESA

The Munich Dust Counter (MDC) is a scientific space experiment on board the Japanese satellite Hiten (Muses-A). The plasma, that is generated by the impact of cosmic dust particles in a target, is measured to determine mass, velocity, and crude flight direction of cosmic dust particles. The experiment setup and the satellite mission are described and the results of the first year of operation of the MDC are presented. From these particle measurements, preliminary results were derived, describing the cosmic dust flux versus time, particle velocity, and mass. These results were analyzed in more detail using the calibration data in order to discuss the spatial distribution and the directional distribution indicating the different populations of cosmic dust, apex particles, and pro and retrograde beta-meteoroides. An eccentric, massive x-ray binary provides a singularly favorable opportunity to probe the stellar wind of the blue supergiant companion star: the velocity profile can be derived with the help of the x-ray luminosity and of the rate of mass loss from the primary. Optical spectroscopic observations and contemporary x-ray measurements are used to estimate the acceleration of the wind of WRA 977. The mass loss rate along the orbit is deduced from H beta P Cyg profiles. Data from 1977 indicate a velocity law considerably slower than that predicted by radiation driven model. ESA

The Infrared Space Observatory (ISO) will operate at wavelengths from 2.5 to 200 micrometers. ISO will provide astronomers with a unique facility of unprecedented sensitivity for a detailed exploration of the universe, ranging from objects in the solar system right out to sources at cosmological distances. The cryogenically cooled telescope will be equipped with four scientific instruments, which together will permit photometric, spectroscopic, and polarimetric observations as well as imaging. In keeping with ISO's role as an observatory, two thirds of its observing time will be made available to the general astronomical community, via the submission and selection (by peer review) of proposals. The remaining time will be reserved for the groups who provide the instruments, for the mission scientists, and for the observatory team who conducts the scientific operations. ISO is scheduled to be launched in 1994 and will be operational for at least 18 months. ESA

A2163: AN EXCEPTIONALLY HOT CLUSTER OF GALAXIES **c90**

M. Arnaud *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Space Sciences with Particular Emphasis on High-Energy Astrophysics Jul. 1992 p 177-178 (For primary document see N93-23878 08-88)
Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The x-ray spectrum of the distant galaxy cluster A2163 (z = 0.203) was measured in the energy range 1 to 18 keV with the Ginga satellite. A combined analysis of these data with data previously obtained with the Einstein observatory is presented. The temperature and x-ray luminosity derived are exceptionally high compared to other clusters: kT = 13.9 keV, L(sub X)(2 to 10 keV) 6.3 x 10(exp 45) ergs/s, as well as the gas mass 9 x 10(exp 14) solar mass and binding mass 27 x 10(exp 14) solar mass. The implications of the existence of such a cluster for cosmological models of the formation of structure in the universe are discussed. ESA

THE OPTICAL COUNTERPARTS OF THE X RAY BINARIES IN NGC 6712 AND 47 TUCANAE **c89**

Lydie Koch-Miramond and Michel Auriere (Observatoire du Pic-du-Midi, Bagneres de Bigorre, France.) *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Space Sciences with Particular Emphasis on High-Energy Astrophysics Jul. 1992 p 179-180 (For primary document see N93-23878 08-88)
Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

Photometric and spectroscopic observations in the error box for the x-ray burster X1850-086 in NGC 6712, obtained with the New Technology Telescope at the European Southern Observatory (La Silla), in excellent seeing conditions, are presented. For the first time with an homogeneous set of observations, it is shown that the star, called S, located at about 0.8 arcsec from the x-ray/radio source position, is a UV object with: B = 21.2 + or - 0.2, U-B = -0.8 + or - 0.3 and B-V = 0.2 + or - 0.5. Its dereddened colors and x-ray to optical luminosity ratio fit those of a Low Mass X-Ray Binary (LMXRB) and thus NGC 6712:S has to be considered as the optical counterpart of X1850-086. The absolute magnitude of NGC 6712:S is as faint as M(sub v) = 5.6 + or - 0.5 and this object is thus confirmed to belong to the class of compact LMXRB underluminous in the optical. The star S was monitored in the U passband during 4 hours 35 minutes and dimming of the star by about 0.4 mag, at the 3 sigma level, was observed. Two 30 minute long slit spectra with S in the aperture do not show any prominent spectral features characteristic of LMXRB apart a possible filling of the H beta absorption line. ESA

Rosat is an orbiting astronomical observatory sensitive in the 0.02 to 2.4 keV energy range (XUV and X-ray regime). The Rosat archive keeps the raw and auxiliary data and data products from the Standard Analysis Software System (SASS) as well as other evaluation products. The Rosat archival and retrieval system consists of a set of subsystems and utilities. The two main features are the archival subsystem and the retrieval subsystem. The principle of archiving is the storage of data trees rather than files, that is hierarchical structures of directories, subdirectories, and files. Optical disks are the prime storage media. The access criteria are the grouping of data called project and a keyword, which describes the type of data. One objective of an archival system is the easy retrieval. This is achived by sorting the file sets in different archive volumes. The whereabouts, size etc. of the data are kept in the archive catalog of the relational database INGRES. On retrieval these saved sets are unpacked and copied back to a user disk or the so called archive pool, a set of disks with 'Read' access for the user. ESA

The German x-ray satellite Rosat serves as a spaceborne observatory for cosmic x-rays. Since its launch 1 Jun. 1990, it has gained precious data and extended the picture of the Universe. As Rosat has now reached its initially designed lifetime of 1.5 years, a short summary of its mission is given from the technical point of view. The technical results allow continuation of the successful Rosat mission. ESA

An investigation to determine the number of WTTS (Weak line T Tauri Stars) and their spatial distribution, to study their physical properties, and to find possible differences between these parameters and the individual star forming regions is presented. An algorithm was used to cross correlate positions in the Simbad database with Rosat PSPC (Position Sensitive Proportional Counter). To identify the x ray sources without known optical counterparts, extensive spectroscopic observations were carried out. Results show that the WTTS are distributed over a much larger area than classical TTS, which tend to be concentrated near the cloud cores. This indicates that the WTTS may be useful in tracing the history of star formation in star forming regions, although the sample of WTTS is as yet too small to draw any further conclusion. ESA

The necessity for a wide angle UV space telescope for astrophysical investigations is outlined. Some of the main scientific goals such as full sky survey and the study of UV emission of extragalactic and galactic objects, which may be achieved by the use of the Astrophysical Schmidt Orbital Telescope (ASCHOT), are presented. The concept of the telescope design, its optical and the detector system, and its system of guidance are described. The limiting sensitivity of the telescope is estimated: it is about 24(sup m) for stellar objects at 1500 A. ESA

A grid of evolutionary synthesis models for different scenarios (initial mass function slope, metallicity, age, etc.) and computing a set of observables in a wavelength range extending from soft x-rays to radio is reported. The model predictions were compared with observational data for a sample of 13 star forming galaxies of different morphologies, aiming to constrain the properties of the star formation episodes taking place there. The most relevant results found are the following: the slope of the IMF (Initial Mass Function) is not universal, varying in the range 1 to 3 in starburst galaxies; there is no correlation between IMF slope and metallicity of the environment in the sample; and the interstellar absorption follows a law similar to the SMC one in regions dominated by massive stars, independently on their metallicity. Results from computer experiments based on high resolution interplanetary magnetic field and plasma data from spacecrafts Pioneer 10 and 11 are presented. Energetic particle acceleration and propagation play an important role in high energy astrophysics and especially to the origin of cosmic rays. Spacecraft measurements of cosmic rays and of the solar wind (plasma velocity and magnetic field) give a unique opportunity to study in situ these processes. The acceleration in realistic shocks and mean free paths at different heliodistances are computed. ESA

The ideas and objectives behind a small scientific satellite for URM (Ulysses Reference Mission) are described. As a complementary element to the relatively big and complex missions there is a worldwide trend to small and ingenious missions. Particular interest was to probe the idea of a small complement to the big interplanetary mission Ulysses. The original idea within the former ISPM (International Solar Polar Mission) program was the simultaneous investigation of both solar poles with two solar probes (one from ESA and one from NASA). But in 1981 NASA stopped its contribution for cost reasons. Therefore the small satellite URM, carrying the five main Ulysses instruments on board, is supposed to compensate partly for the cancelled U.S. spacecraft by performing scientific baseline measurements. The Position Sensitive Proportional Counter (PSPC) is the prime focal plane instrument on board the X-ray astronomy satellite Rosat. It is a conventional multiwire counter, operating in an energy range from 0.1 to 2.4 keV. Its performance results in an energy resolution of delta E/E 0.41 FWHM, a position resolution of 230 micrometers FWHM and a quantum efficiency of 50 percent at 1 keV respectively. The background rejection capability in orbit of 99.85 percent was even higher than expected. Therefore the X-ray images have a high contrast, with a residual charged particle induced background as low as 0.000005 cts/s/sq arcmin/keV. The gain stability of the detector is very high, with a short time variation over one orbit of less than 1 percent and a long term gain drift over one month of 0.5 percent. The redundant PSPC, which is in operation since Jan. 1991, shows about the same performance. ESA

X RAYING THE INTERSTELLAR DUST **c90**
Peter Predehl *In* ESA, Environment Observation and Climate Modelling Through International Space Projects. Space Sciences with Particular Emphasis on High-Energy Astrophysics Jul. 1992 p 209-210 (For primary document see N93-23878 08-88)
Copyright Avail: CASI HC A01/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The investigation of halos surrounding X-ray sources behind sufficiently dense dust columns provides an opportunity to separate the absorption and scattering components of interstellar extinction. The Rosat telescope, with the PSPC (Position Sensitive Proportional Counter), due to its very small mirror scattering and low background, is able to directly image dust scattering halos and determine the dust properties along the line of sight. X-ray scattering in dust particles and interstellar extinction are addressed and the gas to dust correlation is shown. ESA

Monochromatic composite images of Halley's coma in a 50 deg angular sector of radial extent 40,000 km are constructed in taking advantage of the spatial scanning capability of the Vega 2 three channel spectrometer. These images show the existence of two well contrasted jets which are identified in the solar dust scattered continuum as well as in the molecular emissions. The spatial distribution of dust scattered intensity in the UV at 377 nm and the visible at 482 nm are compared in computing an image of the I(sub 377)/I(sub 482) intensity ratio. The image shows that the ratio is slightly bluer in a region located between 10,000 and 25,000 km which appears as a result of jet spreading. The existence of a region connected with the jets where the color of dust is bluer is interpreted as the result of fragmentation of dust grains transported inside jets from the nucleus to distances of 10,000 to 25,000 km. The fragmentation processes would produce a local source of tiny submicronic particles of radius a less than 0.4 micrometers and would also be followed by a release of gas. The results presented provide a strong argument for the existence of an extended source connected with the jets. It is coherent with the detection of a CO source at 10,000 km by the Giotto NMS spectrometer 5 days later. ESA

About 40 percent of the galaxies in the extragalactic neighborhood have been identified with sources of the IRAS Point Source catalog. In most cases the infrared radiation is due to heated interstellar dust in the galaxies. The dust masses in dwarf systems have been estimated using simple models of dust clouds. There is no clear relation between the luminosity and the estimated dust mass of a galaxy. The gas to dust ratio in the interstellar medium of the dwarfs is more than one order of magnitude larger than in the interstellar medium of the Galaxy confirming the well known fact of low metal abundance in low luminosity systems. The measurement of gamma ray bursts by using interplanetary network and study of the morphology of light curves are discussed. Ulysses, now close to Jupiter, PVO, orbiting the planet Venus and CGRO, the Compton Gamma Ray Observatory near the Earth, all carry gamma ray burst detectors. The Ulysses detector, which is further away from the Earth than any previous burst detector is sensitive to 2 to 150 keV X-rays and with time resolution down to 8 ms. By the time of arrival method more than 12 gamma ray bursts were detected by three widely separated detectors and can be localized with high accuracy depending on the location of the various spacecraft. The Rosat X-ray astronomy satellite was launched 1 Jun. 1990 into a circular orbit with an inclination of 53 degrees and an altitude of 580 km. After an initial 2 month verification and calibration phase, Rosat began the first all sky X-ray survey in the soft X-ray (0.07 to 2.4 keV; 100 to 5 A)

and the extreme ultraviolet (0.025 to 0.2 keV; 500 to 60 A) bands using imaging telescopes. The first analysis of the six month survey is complete; about 60,000 new X-ray and 400 new XUV sources were detected. In Feb. 1991 pointed observations proposed by guest observers began. By the end of 1991 more than 1000 individual targets had been observed. The Rosat Standard Analysis Software System (SASS), set up to process all data from the survey and pointing phases, is described. ESA

INTEGRAL is dedicated to the fine spectroscopy and imaging of celestial gamma ray sources in the energy range 15 keV to 10 MeV. The instruments on INTEGRAL will achieve a gamma ray line sensitivity of 3 times 10 to the minus 6th power ph/sq cm/s, a continuum sensitivity of 3 times 10 to the minus 8th power ph/sq cm/s/keV at 1 MeV (approximately 10 mCrab at 1 MeV) and imaging with an angular resolution of better than 20 minutes. This represents an order of magnitude improvement over the Gamma Ray Observatory (GRO) in line sensitivity, energy resolution and angular resolution. Comparison with the low energy gamma ray telescope Sigma also shows a major advance: the continuum sensitivity improvement is considerably more than one order of magnitude between 100 keV and 1 MeV; and the narrow line sensitivity is increased by nearly two orders of magnitude. INTEGRAL consists of two main instruments: a germanium spectrometer and a caesium iodide coded aperture mask imager. These instruments are supplemented by two monitors: an X-ray monitor and an optical transient camera. ESA

Based on the orientation of relativistic jets of BL Lac objects, the observed apparent magnitude of 32 radio selected, and some of 43 X-ray selected BL Lac objects were corrected for Doppler effect. The corrected magnitude shows just as good a correlation with the correlational coefficient as previous results, which imply that the redshifts of BL Lac objects are cosmological. Other results obtained are: the uncorrected X-ray selected BL Lac objects fit the Hubble diagram well although their magnitudes were corrected because of the lack of relevant parameters; consistent with the fact that the X-ray selected BL Lac objects have jets with randomly oriented directions; the results show the average redshift $z = 0.23$ for X-ray selected BL Lac objects, and $z = 0.57$ for radio selected ones; four out of five BL Lac objects whose redshifts are very uncertain fit the Hubble diagram well. EXSAS (Extended Scientifc Analysis System), based on the European Southern Observatory MIDAS image processing system, is a large software system for interactive analysis of X-ray and XUV data from the Rosat satellite. A multitude of typical applications and utilities in the areas of data preparation, correction of instrumental effects, spatial, spectral and timing analysis are implemented in a coherent context. EXSAS will normally be run interactively on workstations, but may also be used in batch mode. Some of the basic features and design criteria of the EXSAS/MIDAS environment that enable observers to effectively work with the system are listed. ESA

STELLAR LYMAN ALPHA EMISSION AND THE LOCAL INTERSTELLAR MEDIUM Final Technical Report, 15 Nov. 1991 - 14 Nov. 1992

Theodore Simon 14 Nov. 1992 50 p

(Contract NAS5-30446; NAG5-146; NAG5-1823)

(NASA-CR-192635; NAS 1.26:192635) Avail: CASI HC A03/MF A01

Under the auspices of this ADP program, a systematic study was made of IUE archival images in order to extract spectra of the Lyman alpha region and to measure the stellar Lyman alpha flux for as many late-type stars as possible. The Lyman alpha resonance line is a powerful cooling channel for the hot chromospheres of solar-type stars, but has not been studied before in any systematic fashion across the H-R diagram. A major deterrent which has limited the use of Lyman alpha in the study of stellar chromospheres is the contamination of this spectral feature caused by the scattering of solar Lyman alpha photons in the Earth's exosphere. This scattered light is monochromatically imaged through the entrance slot of the IUE telescope and is superposed onto the stellar spectrum. In all but the shortest exposures with IUE, this 'geocoronal emission' overwhelms the stellar flux and makes it impossible to directly measure the strength of the stellar chromospheric feature. The IUESIPS processing contains no provision for correcting standard G.O. output products for this contamination. The first task was to develop a scheme for removing the geocoronal flux, specifically from low-dispersion spectra taken with the Short-Wavelength

Camera of IUE. The strategy adopted was to fit a 'sky model' to the spatially-resolved geocoronal emission observed through the large science aperture of the telescope, using the spectral orders on either side of the central ones where the stellar emission is concentrated. The model emission was then subtracted from the observed image, leaving behind the corrected stellar Lyman alpha emission. The details of this fitting procedure are described. Having devised a successful method for removing the unwanted geocoronal emission, the correction procedure was applied to 366 archival images which, from inspection of the photowrites in the IUE browse file, seemed especially promising. In this survey, Lyman alpha emission were eventually detected in the spectra of 227 stars representing a wide range in age, temperature, and luminosity throughout the cool half of the H-R diagram. Previously fewer than 30 such stars had been measured, and an order of magnitude increase in the numbers of stars having Lyman alpha flux measurements is provided. Multiple measurements were made for 52 stars and upper limits on chromospheric flux were derived for another 48 stars. Author (revised)

ROSAT ALL SKY SURVEY OBSERVATIONS OF IRAS GALAXIES

T. Boller (Academy of Sciences, Potsdam, German D.R.), E. J. A. Meurs, W. Brinkmann, H. Fink, U. Zimmermann, and H.-M. Adorf (European Southern Observatory, Garching, Germany.) Mar. 1992 28 p Submitted for publication

(MPE-Preprint-220; ETN-93-93531) Copyright Avail: Fachinformationszentrum Karlsruhe, 7514 Leopoldschafen-Eggenstein 2, Germany

A catalog of 244 IRAS galaxies positionally coincident with Rosat x-ray sources, which results from the correlation of a sample of 14708 extragalactic IRAS sources selected from the Point Source Catalog via statistical classification with the Rosat All Sky Survey, is presented. For 222 of them, optical counterparts could be identified by comparison with the NASA/IPAC Extragalactic Database. The sample of x-ray emitting IRAS galaxies comprises infrared luminous nearby galaxies, spirals and ellipticals, Seyfert galaxies, and Quasi Stellar Objects (QSO's). It is dominated by galaxies with active nuclei, unlike the sample of IRAS galaxies which have not been detected at x-ray wavelengths, at least in part due to the flux limitations of the Rosat survey. An unexpected result is the discovery of several spiral galaxies with luminosities up to 10 to the 43rd power erg/s, well above those found with the Einstein satellite. This suggests as a possible explanation that the x-ray luminous spirals are starbursts which are characterized by steep spectra and thus are more easily detected by Rosat. The x-ray properties are studied as a function of IR and optical fluxes for the different subgroups of galaxies in the sample. In general, a positive correlation is found between the x-ray luminosity and the IR and optical luminosities, respectively, which is steepest for Seyfert galaxies. The latter also appear to be separated from the other classes in correlations involving x-ray to IR or optical flux ratios. The x-ray to IR or optical flux ratios will be valuable for preselecting Seyfert galaxies when comparing x-ray to IR or optical surveys. By taking Seyfert galaxies into account, the trend of an increasing ratio f(sub x)/f(sub opt) with decreasing optical absolute magnitude, found for x-ray bright QSOs alone, is removed. ESA

MAPPING THE UNIVERSE: STATISTICAL MEASURES OF THE GALAXY DISTRIBUTION Thesis

Houjun Mo Jun. 1991 212 p Sponsored by Max-Planck-Gesellchaft, and Academia of Sinica, China

(ETN-93-93456) Avail: CASI HC A10/MF A03

Statistical methods and their applications to study the large scale structures indicated by different objects, an important part of the mapping of the Universe, are addressed. From the observational data a number of statistical results that give constraints to the current models of galaxy formation are obtained. Theoretical models for the large scale structure formation in the Universe are summarized together with a number of catalogs that can be used for statistical purposes. During the study of the statistical methods for characterizing large scale structures special attention was given to the error analysis in these statistics. The angular two and three point correlation functions of the European Space Observatory (ESO)-Uppsala Catalog are estimated in angular diameter limited samples and the diameter function given by Lahar et al. is used to scale the results. The aim is to test the universality of some early results by using differently selected samples and samples formed in different regions. The morphological segragation of galaxies on large scales is analyzed together with the luminosity seggregation in the galaxy distribution. The large scale structure indicated by clusters of galaxies is then investigated using both the Abell and Zwicky catalogs. Outlook for future work is given. ESA

[ACTIVITIES REPORT OF THE EUROPEAN SOUTHERN OBSERVATORY] Annual Report, 1991

1992 129 p In ENGLISH; FRENCH; and GERMAN

(ETN-93-93459) Avail: CASI HC A07/MF A02

The dualities in European Southern Observatory's character brought about in part by the temporary but lengthy assignment to design and construct the Very Large Telescope (VLT) while operating La Silla (Chile), the world's largest optical/infrared observatory at the same time, are stressed in the introduction. Astronomical research performed in 1991 is reviewed. Activities of the European Coordination Facility or the Space Telescope (ST-ECF) are reviewed. These mainly concerned the support to users of cycle 1 and cycle 2 proposals, with the development of analysis tools and with the operation of the Hubble Space Telescope archive. Relations with Chilean authorities and image processing developments are considered. ESO conferences and workshops are listed. Work performed on telescopes since the choice of Paranal Peak near Antofagasta (Chile) as the site of the world's largest optical telescope is reported. The installation of the SEST bolometer, a general user instrument is addressed. Developments with other telescopes such as the NTT and with instrumentation of the VLT and the La Silla observatory are reported. Organizational, financial, and administrative matters are addressed. Appendices addressing the following are included: use of telescopes, programs, publications, and council and committee members. ESA

FIFTH FUNDAMENTAL CATALOGUE. PART 2: THE FK5 EXTENSION - NEW FUNDAMENTAL STARS

W. Fricke, comp., H. Schwan, comp., T. Corbin, comp., U. Bastian (Naval Observatory, Washington, DC.), R. Bien, C. Cole (Naval Observatory, Washington, DC.), E. Jackson (Naval Observatory, Washington, DC.), R. Jaehrling, H. Jahreiss, and T. Lederle et al Karlsruhe, Germany G. Braun G.m.b.H. 1991 145 p Sponsored in part by Heidelberg Univ.

(Rept-33(1991); ETN-93-93462) Avail: CASI HC A07/MF A02

The mean positions and proper motions for 3117 new fundamental stars essentially in the magnitude range about 4.5 to 9.5 are given in this FK5 extension. Mean apparent visual magnitude is 7.2 and is on average 2.5 magnitudes fainter then the basic FK5 which has a mean magnitude of 4.7. (The basic FK5 gives the mean positions and proper motions for

the classical 1535 fundamental stars). The following are discussed: the observational material, reduction of observations, star selection, and the system for the FK5 extension. An explanation and description of the catalog are given. The catalog of 3117 fundamental stars for the equinox and epoch J2000.0 and B1950.0 is presented. The parallaxes and radial velocities for 22 extension stars with large forecasting effects are given. Catalogs used in the compilation of the FK5 fundamental catalog are listed. ESA

ASTEROID DETECTION AND MONITORING USING A SATELLITE-BORNE VISIBLE SCANNER
William A. Shaffer, Martin J. McHugh, and Dexter Wang 15 Jan. 1993 11 p
(AD-A259797; NRL/FR/5621-93-9538) Avail: CASI HC A03/MF A01

A satellite-borne visible scanner is proposed to continuously monitor the celestial sphere for near Earth asteroids. The proposed scanner uses the parallax motion of near Earth objects against a fixed background of distant objects. Image processing techniques will allow the detection of asteroids as small as 50 m in diameter at distances greater than 7 x 10(exp 6) km. This will give sufficient warning time against Earth intersecting asteroids. GRA

STANDARDIZATION WORK FOR THE CALIBRATION OF INTENSITIES OF CELESTIAL OBJECTS *Final Report*
Arlo U. Landolt 16 Apr. 1993 3 p
(Grant NAGw-2911)
(NASA-CR-192831; NAS 1.26:192831) Avail: CASI HC A01/MF A01

Observations of celestial phenomena need to be calibrated, to be related, to some measurable quantity. There continues to be a long-term need for accurate photometric standard stars, those with known intensities and colors, so that brightness and color measurements made of various celestial phenomena by different observers can be integrated and compared with one another. Toward this end, the author has been emphasizing data collection in recent years for stars of 'intermediate' brightness, those approximately in the magnitude range 11.5 is less than V is less than 16.0. Photoelectric data were obtained at the Cerro Tololo InterAmerican Observatory's (CTIO) telescopes for stars in certain selected areas near the celestial equator. Stars of extreme color outside the selected areas, but near the equator, also were selected to provide a more broad and complete range in color index. It was proposed to complete the photoelectric phase of the program. The author proposed developing extremely faint sequences of photometric standard stars useful for both large space-based detectors and for land-based detectors. These data were to be collected via charge-coupled devices (CCD's) at telescopes located at CTIO and at the Las Campanas Observatory (LCO), both observatories being located in Chile. It was hoped that accurate data could be collected down to the 21st or 22nd magnitude. Author (revised)

THE BOSTON UNIVERSITY-ARECIBO GALACTIC HI SURVEY: THE GALAXY AT 4 ARCMINUTE RESOLUTION Ph.D. Thesis
Thomas Andrew Kuchar 1992 304 p
Avail: Univ. Microfilms Order No. DA9236664

A new, high resolution survey of neutral atomic hydrogen (H I) emission has been conducted at the Arecibo Observatory. The survey investigated the thermal and kinematic properties of H I associated with objects of astronomical interest. The small beamwidth of the telescope (4') allowed the detection of absorption features and small scale structures that were unresolved in other large scale surveys. The survey consists of a 30 square degree map of the first galactic quadrant and smaller maps of 40 targeted objects. The first quadrant survey was used to examine the global kinematics of H I and the atomic properties for a subfield of molecular clouds. The spin temperatures and optical depths were determined for H I clouds seen in absorption toward H II regions (areas of ionized gas which surround young, hot stars). These temperatures appear strongly correlated with the measured optical depths. Kinematic distances were determined for 70 H II regions, 45 of which for the first time. A comparison between the Survey and other galactic-scale surveys can reveal additional physical properties of the interstellar medium. This was done in part by examining infrared emission from the H II region sample. The dust opacity and color temperatures were determined using data from the Infrared Astronomy Satellite. The luminosity distribution of the H II regions was calculated using the previously derived kinematic distances. One of the targeted fields was the Rosette Molecular Complex, a giant molecular cloud and a site of recent star formation. The total (atomic and molecular) mass of the complex was found to be 1.43 x 10(exp 5) solar mass of which 60 percent is in the atomic phase. The complex contains 30 molecular 'clumps' embedded in a low density gas. The clumps range from a few to several hundred solar masses and from 2 to 7 pc in diameter. An expanding shell, centered on the nebula, was detected in both the atomic and molecular gas. The dynamical age for the shell is approximately 4 million years, which is consistent with the age of the central star cluster NGC 2244.

THE COLD IONIZED SHELL AROUND THE OLD NOVA DQ HERCULIS Ph.D. Thesis
John Ellis Beaver 1992 167 p
Avail: Univ. Microfilms Order No. DA9238128

Long-slit spectra of the shell around DQ Her have been obtained using the Ohio State CCD spectrograph on the Perkins 1.8 m telescope of the Ohio State and Ohio Wesleyan Universities. The spectra, which spatially cover most of the shell, have relative flux-calibration and span the range 3500 A to 6690 A, at 10-A resolution. In addition, spectra at 2.5-A resolution, centered at H-alpha have been obtained for 11 position angles through DQ Her. The geometry of the shell can be determined kinematically if the near-degeneracy between the oblate and prolate cases (due to the high inclination) is resolved. A robust test for the symmetry axis is developed and it is shown that the prolate case is strongly favored. A prolate-spheroidal model is applied to the data and a distance of 520 plus or minus 30 pc is derived. The low-resolution spectra are binned into regions corresponding to the 'polar', 'equatorial', and 'tropical' bands seen in direct images. The slope of the Balmer continuum indicates a temperature of approx. 400 K for all three regions. The ratio H-alpha/H-beta is found to be roughly 3.6, in fair agreement with theory. (N I) lambda 5200 is found to be stronger at the equator, while the N II recombination lines are weaker. The spatial dependence of the ionizing radiation emitted by DQ Her, as implied by the level of ionization, is found to have an angle-dependence in agreement with that expected for a luminous accretion disk,. The implied flux toward the polar region is in agreement with an accretion disk model for m = 10(exp -17) g s(exp -1). The flux of (N II) lambda 6584 is observed to be roughly 0.4 H-beta for all three regions, in contrast to N II lambda 5005. It is concluded that collisional excitation in a warm component is partly responsible. The time-dependence, as the nebula expands, of this line is investigated with photoionization models, and it is concluded that only a small fraction of the gas is hot enough for collisional excitation. It is argued that models explicitly allowing for multiple density components are necessary to properly describe the basic features of this nebula.

CARLSBERG MERIDIAN CATALOGUE LA PALMA (SPAIN). NUMBER 6: OBSERVATIONS OF POSITIONS OF STARS AND PLANETS 1990
1992 252 p Prepared in cooperation with Copenhagen Univ., Denmark, and Royal Greenwhich Observatory, Cambridge, England
(ISBN-84-7469-052-8; ETN-93-93539) Avail: CASI HC A12/MF A03

Positions and magnitudes of 12,771 stars north of declination -45 deg, 11,555 proper motions, and 1,368 positions and magnitudes of 69 solar system objects obtained with the Carlsberg Automatic Meridian Circle on La Palma (Canary Islands) during the year 1990. The positions of the stars are for the epoch of observation and the equinox J2000.0, and are in a system close to that of the FK5. The limiting magnitude is m(sub v) = 14.8. The catalog mainly comprises the following stars: 4143 faint reference stars in a global net; 3162 International Reference Stars; 1040 faint reference stars in the fields of about 200 benchmark radio sources; 889 A5-G0 stars near the north galactic pole; 535 stars from an unbiased sample of K-M dwarfs; and 751 stars in nearby O-B associations. The catalog also contains observations of Callisto, Titan, Iapetus, Uranus, Neptune, Pluto, and 63 minor planets. The mean error of a catalog position in the zenith is 0.08 sec in right ascension and declination, and 0.04 min in magnitude. The mean error of the proper motions, derived by combining

the position in this catalog with those at earlier epochs, is typically 0.002 sec per year. Cross references are given to DM, AGK, SAO, HD, and the double star catalogs ADS and WDS. ESA

[INVESTIGATION OF SERENDIPITIOUS WFC SOURCES]
Edward L. Robinson 1 Mar. 1993 3 p
(Grant NAG5-1829)
(NASA-CR-192774; NAS 1.26:192774) Avail: CASI HC A01/MF A01

The serendipitious WFC sources under investigation, i.e., those which just happened to lie in the field of view while another object was being studied, were disappointing. The integration times were chosen to suit the primary target not the serendipitous targets. UX UMa, CZ Ori, BI Ori, WX Cet and AR And were not detected. A long (approximately 17 ksec) pointed observation of UX Uma (PI Wood) has since been carried out (February 1993) and the data is expected shortly. The other observations were much more successful. V471 Tau was observed with the WFC for 6.5 hrs with the S1 filter and 1.1 hrs with the S2b filter. It was easily detected with a count rate of 0.03 cps in the S1 filter and 0.15 cps in the S2b filter. The oscillations were seen, even before the data was folded, as was expected from preliminary results from the survey (Barstow et al. 1992). The pointed observations provide a much better phase coverage of the oscillations than did the survey data where the coverage was sparse. These data will be presented in a paper with the PSPC data (PI's Robinson and Shipman) and the pulse profiles in the different wavelengths will be compared. Author

A workshop at Los Alamos in January 1992 evaluated the issues involved in intercepting celestial objects approaching the Earth. It covered the technologies for acquiring, tracking, and homing on them, as well as those for interceptors to inspect, rendezvous with, land on, irradiate, deflect, or destroy them. This report records the presentation and technical options reviewed. DOE

(NASA-CR-192704; NAS 1.26:192704) Avail: CASI HC A02/MF A01

A large portion of the inner galactic plane has been mapped in the far-infrared (C II) line using a balloon-borne survey instrument. Complete coverage is reported from 25 degrees north to 80 degrees south of the galactic center and extending a few degrees on each side of the plane. Effective resolution is 14.1 acrmin (FWHM) and contour levels begin at 2 E -5 ergs/(s x sq. cm x ster). When compared with 100 micron dust emission observed by IRAS the (C II) appears well correlated with the dust emission except for a 10 degree region centered on the galactic center where emission from the gas is much weaker than that from the dust. HAMILTONIAN STRUCTURE OF THE VLASOV-EINSTEIN SYSTEM AND THE PROBLEM OF STABILITY FOR SPHERICAL RELATIVISTIC STAR CLUSTERS
H. E. Kandrup (Florida Univ., Gainesville.) and P. J. Morrison Nov. 1992 73 p
(Contract DE-FG05-80ET-53088)
(DE93-006180; DOE/ET-53088/585; IFSR-585) Avail: CASI HC A04/MF A01

The Hamiltonian formulation of the Vlasov-Einstein system, which is appropriate for collisionless, self-gravitating systems like clusters of stars that are so dense that gravity must be described by the Einstein equation, is presented. In particular, it is demonstrated explicitly in the context of a 3 + 1 splitting that, for spherically symmetric configurations, the Vlasov-Einstein system can be viewed as a Hamiltonian system, where the dynamics are generated by a noncanonical Poisson bracket, with the Hamiltonian generating the evolution of the distribution function f (a noncanonical variable) being the conserved ADM mass-energy H(sub ADM). An explicit expression is derived for the energy (delta(exp 2))H(sub ADM) associated with an arbitrary phase space preserving perturbation of an arbitrary spherical equilibrium, and it is shown that the equilibrium must be linearly stable if (delta(exp 2))H(sub ADM) is positive semi-definite. Insight into the Hamiltonian reformulation is provided by a description of general finite degree of freedom systems. DOE

MODEL ATMOSPHERES FOR LOW TEMPERATURE, HELIUM-RICH WHITE DWARFS: PROBLEMS WITH THE EQUATION OF STATE Ph.D. Thesis
Eric Roger Peterson 1992 189 p
Avail: Univ. Microfilms Order No. DA9239482

The Hummer-Mihalas equations are used to calculate an equation of state appropriate for low temperature, helium-rich white dwarfs. These equations take into account non-ideal gas effects, most importantly pressure ionization. New thermodynamic properties and opacities of two mixtures are calculated and used to construct model atmospheres for DZ stars with effective temperatures ranging from 4000 K to 7000 K. A temperature reversal is found to occur in the optically thin outer layers. The pressure ionization of Ca, Mg, and Fe is also found to occur already at small optical depths. This indicates that the abundances of these elements in stars like van Maanen 2 may be larger than previously believed. This could be important for the accretion hypothesis generally believed to explain the origin of heavy elements in DZ stars. Exploratory synthetic spectra are calculated for van Maanen 2. Dissert. Spectroscopic observations elucidating the spatial distribution, kinematics, and desity structure of atomic and molecular gas within about 2 pc from IRS16/SgrA* are presented. Measurements confirm the presence of a dense (n(H2) approximately 1,000,000/cu cm), clumpy molecular gas ring surrounding a short lived central cavity of much lower mean gas density. It appears that this ring consists of several distinct and probably short lived (less than or approximately equal to 1,000,000 years) gas streamers that result from accretion from the massive molecular clouds within 10 to 30 pc of the center toward the central gravitational potential. Within 1 pc of SgrA*, a large atomic cloud (approximately 300 solar mass) is found, that appears to be falling in from greater than 3 pc galactocentric distance into the central cavity. The northern and eastern 'arms' of ionized gas are very likely dense, bright rims at the surface of this atomic cloud that is now exposed to the intense ultraviolet radiation from the central few arcsec surrounding IRS16/SgrA*. Most of the characteristics of the spatial distribution of the various observed components of ionized, atomic, and molecular gas can now be understood as the result of the impact of 1,000,000 solar luminosity of UV radiation from IRS16/SgrA* in a number of infalling gas streamers. A STUDY OF PROPERTIES OF DARK GALAXY HALOS IN A CDM UNIVERSE USING N-BODY COMPUTER SIMULATIONS Ph.D. Thesis
Tereasa Gail Brainerd 1992 138 p
Avail: Univ. Microfilms Order No. DA9238137

Using N-body simulations in which large dynamic ranges in mass and

length can be achieved simultaneously, the mass function, spatial correlation properties, and peculiar velocity field of dark matter galaxy halos were investigated as a function of environment. A standard cold dark matter (CDM) universe was assumed. Halos were identified using a friends-of-friends algorithm with linking parameters l = .1, 0.2 and 0.3. The mass function of l = 0.2 and 0.3 halos is well-fit by a power law of index -1 plus or minus 0.1 for 10(exp 10) M(solar) approximately less than M(halo) approximately less than 10(exp 13) M(solar). The mass function of l = 0.1 halos is well-fit by a power law of index approximately -1.1 to approximately -1.4. The Press-Schecter prediction is a poor fit to the numerical mass function. Below a mass scale of approximately 10(exp 11) to approximately 10(exp 12) M(solar), l = 0.2 halos are produced with the same efficiency in regions of high, low, and average background mass density. The formation of halos with M(halo) approximately greater than 10(exp 13) M(solar) is strongly biased toward regions of high mass density. From the two-point correlation function, xi(r), the linear bias model is a good description of the formation of l = 0.2 halos (on scales up to approximately 30h(exp -1 Mpc), but not the l = 0.1 and 0.3 halos. In a low normalization universe (1/sigma 8 = 2.5), high mass halos are more strongly clustered than low mass halos; in a high normalization universe (1/sigma 8 = 1.5), high and low mass halos are clustered to the same degree. All the power in xi(r) for l = 0.1 halos comes from halos in high density regions, and for the l = 0.2 and 0.3 halos, most of the power in xi(r) comes from halos in high density regions, but there is a contribution from halos in average density regions. High mass l = 0.2 and 0.3 halos are fair tracers of the major mass motions in the simulation, and their low mass counterparts are biased tracers. The larger the local background density, the larger is upsilon(rms) of the halos, but it is not straightforward to estimate a local suppression or enhancement in mass density from upsilon(rms). For 2.5h(exp -1) Mpc approximately less than r approximately less than 12.6h(exp -1) Mpc, the velocity correlation function for l = 0.2 halos at 1/sigma 8 = 0.2 agrees well with the velocity correlation function of spiral galaxies. Dissert. Abstr.

THE RADIATION GASDYNAMICS OF PLANETARY NEBULAE Ph.D. Thesis
Adam Frank 1992 207 p
Avail: Univ. Microfilms Order No. DA9239448

Using a highly accurate numerical method developed specifically for this problem the violent hydrodynamics of interacting stellar winds (ISW) of planetary nebulae (PNe) are investigated. These models include a full treatment of the radiation transfer, ionization, and radiative heating and cooling. Our results display a rich variety of features which confirm and surpass previously published models. In one dimension we performed a number of simulations which take account of the evolution of the central star and its affect on the dynamics of the nebulae. 'Theoretical observations' of the model PN are calculated. These synthetic intensity profiles, kinematics and line ratios are then compared with real observations. In two dimensions we present model results which demonstrate that the interacting wind scenario can account for the wide range of observed morphologies. By projecting a spherically symmetric fast into a toroidal slow wind the range of elliptical, bipolar and peanut shaped PN can be recovered. Consideration of ionization effects and projection effects further strengthen the case for the ISW models ability to account for the observed properties of PNe.

LATITUDINALLY PERIOD-DEPENDENT PULSATIONS: A MODEL OF THE DISTRIBUTED PERTURBATION IONOSPHERIC HALL CURRENT. THE RESULTANT GROUND FIELD AND A STUDY OF 3 INTERVALS Ph.D. Thesis
Ian Charles Krauklis 1991 273 p
Avail: Univ. Microfilms Order No. BRDX97546

The distributed ionospheric Hall current due to a transverse magnetic perturbation in the magnetosphere has been deduced for a simple model scenario. A vortex structure in the Hall current was generated and is a salient feature of a field line resonance (FLR). The latitudinal period dependency of a Pse could generate a similar structure in the absence of a transverse resonance. The model was used to simulate a pulsation observed on SABRE, good agreement was found between the modelled and observed data. The ground signal due to the Hall current was derived via the Biot Savart law. No period variation was observed on the ground when the coupling between the driving cavity/poloidal mode and the driven transverse mode was strong. A study has been made of 3 events with latitudinally period varying pulsations at plasmaspheric and plasmatrough latitudes. A number of FLR's was observed to contribute to the signature of a Pse. The period dependency in the plasmasphere tended to be an overlapping step like function centered on the FLR's. In the plasmatrough the coupling between the cavity/poloidal mode and the transverse model is less strong. The period variation is more continuous at these latitudes. For events with an azimuthal wavenumber /m/ greater than or equal to 3 the m = 0 decoupled solution of the hydromagnetic equation of motion in dipole coordinates is not valid.

ATMOSPHERIC TRANSMISSION OF POLAR METEORITES
Philippe Bonny (Office National d'Etudes et de Recherches Aerospatiales, Paris, France.) Aug. 1992 240 p Transl. into ENGLISH of Transmission Atmospheriquedes Micrometeorites Polaires et Implications Original language document was announced as N92-20477
(ESA-TT-1283; ONERA-NT-1991-5; ETN-93-93519) Avail: CASI HC A11/MF A03

The current theory is reviewed, as concerns both the aerodynamic field and the material thermal reaction field, and a law governing the vaporization from a mixture of melted oxides is developed. The effect of an organic compound on heating and pyrolysis is analyzed accurately with a computer program that simulates the entire process of ablation of a charforming material. A program to simulate the complete micrometeorite atmospheric entry trajectory, including melting, porosity change, loss of an organic component and vaporization of the major elements of the mineral component was applied over the entire range of micrometeorite velocities and angles of entry. The entry corridor required for each of the three characteristics of the polar micrometeorites is evaluated. After weighting the angle and velocity allowed for each corridor, an entry velocity distribution compatible with actual polar micrometeorite characteristics is found by comparing computer generated data with 'experimental' data. The origin of polar micrometeorites and the part they may have played in bringing organic matter to the early Earth is discussed.

NITROGEN TO CARBON ABUNDANCE RATIOS DETERMINED FROM EMISSION LINES ORIGINATING IN TRANSITION LAYERS BETWEEN STELLAR CHROMOSPHERES AND CORONAE Ph.D. Thesis
Jose L. Mena-Werth 1992 196 p
Avail: Univ. Microfilms Order No. DA9239472

We explore the possibility of determining relative nitrogen to carbon abundances from the emission-line fluxes in the lower transition layers (30,000 K less than T less than 150,000 K) between stellar chromospheres and coronae. The surface fluxes of the transition layer emission lines are proportional to the emission measures E(sub m) and the element abundances A(el). Observations for main-sequence and luminosity class IV stars with presumably solar element abundances show that for the lower transition layers, i.e., for T less than 150,000 K, E(sub m) = BT(-gamma). This is also expected from theoretical considerations. We assume that this relation also holds for stars with nonsolar element abundance ratios. For a given carbon abundance, the constant gamma and B in this relation can then be determined from the C II and C IV emission-line fluxes. The emission measures are thus known for all temperatures between 30,000 and 150,000 K. Ratios of nitrogen to carbon abundances determined in this way for some giants and supergiants agree within the limits of errors with those determined by Luck, by Luck and Lambert, and by Lambert and Ries from molecular bands.

THE FORMATION, STRUCTURE, AND EVOLUTION OF PLASMOIDS Ph.D. Thesis
Mark Bela Santos Moldwin 1993 278 p
Avail: Univ. Microfilms Order No. DA9300031

The configuration and topology of the Earth's magnetotail is radically altered during geomagnetic substorms by the formation and subsequent ejection of large scale magnetic and plasma structures called plasmoids. The formation, structure, evolution and topology of plasmoids are studied by examining the magnetic and plasma data from the 1983 ISEE 3 Geotail Mission. This deep tail data set is combined with observations in the

middle tail by IMP 8, at geosynchronous orbit and from ground auroral magnetometer stations to develop a unified flux rope plasmoid model. It is found that plasmoids are highly correlated with geomagnetic substorms, are large (approximately 10-20 R(sub E)), rapidly tailward moving (approximately 500 km s(exp -1) magnetic flux rope structures, and are very stable (i.e., do not change size, downtail velocity, internal electron plasma energy density, or magnetic field signatures as a function of distance downtail). Evidence for the flux rope topology includes the strong correlation of the direction of the core magnetic field in the interplanetary magnetic field direction, the existence of plasmoids with various orientations with respect to the GSM xy plane, and the apparent mass flux of cool magnetosheath electrons into the structure as the plasmoid propagates downtail. Plasmoids are found to be a ubiquitous feature of the distant magnetotail and are occasionally observed in the relatively near-Earth tail by IMP 8. Due to the apparent large vertical extent of plasmoids, they affect the shape and size of the entire magnetosphere as the propagate downtail. Indirect observations of plasmoids are made in the plasma sheet boundary layer, the lobe, and the magnetosheath adjacent to the magnetopause. Because of their prevalence, size, velocity and magnetic and plasma energy content, plasmoids play an important role in the configuration, morphology, topology, and energy budget of the magnetosphere during geomagnetic substorms. Dissert. Abstr.

N93-23212 Texas Univ., Austin.
THE TWO BLACK HOLE PROBLEM IN 3+1 GENERAL RELATIVITY: ANALYTICAL APPROXIMATIONS AND NUMERICAL SOLUTIONS OF THE INITIAL DATA Ph.D. Thesis
Samuel Rocha Oliveira 1992 181 p
Avail: Univ. Microfilms Order No. DA9239324

This dissertation is concerned with the two body problem in general relativity. A simple analytical study is done for a static axisymmetric spacetime containing two black holes held at rest by a strut between them. Once we have the attractive force, obtained by calculating the compression force on the strut, we estimate the amount of gravitational radiation emitted for orbiting black holes and for two black holes in a head-on collision. We find good agreement with other estimates. The complexity of Einstein's equations for a general spacetime of two black holes leads us to the field of numerical relativity. In order to develop numerical tools for solving the dynamic part of Einstein's nonlinear equations, we study a head-on collision of two soliton solutions (a kink and an anti-kink) of a scalar field in a nonlinear self-potential. It has several qualitative similarities with a head-on collision of two black holes, both physically and numerically. The dynamics of the solitons, in particular whether or not the solitons coalesce, has a fractal dependence on the velocity of approximation. We explore this in detail. For the two black hole initial data we use York's conformal function approach combined with the two-sheeted-manifold isometry conditions to solve the constraint equations. We investigate some numerical algorithms to solve these constraints, which are non-linear elliptical equations, in order to find out fast and efficient algorithms for three-dimensional initial data. Two of the methods we study are finite elements and multiquadrics. We use a finite element method for axisymmetric configurations and a multiquadric method for fully general spatially three-dimensional configurations. Both methods are very appropriate for the boundary shapes of our problem. Finite elements require a lot of bookkeeping; the multiquadrics, on the other hand, require little bookkeeping. Thus the multiquadric method is easy to use in any number of dimensions. Nevertheless the multiquadrics still lack numerical analysis to tell us how to control the errors. Using both methods we reproduce existing axisymmetric solutions with good accuracy, and we have numerically solved the initial data constraint equations for a fully general three-dimensional configuration for two black holes using the multiquadric method. Dissert. Abstr.

THE SOURCE OF FIVE-MINUTE PERIOD PHOTOSPHERIC UMBRAL OSCILLATIONS Ph.D. Thesis
Matthew James Penn 1992 119 p
Avail: Univ. Microfilms Order No. DA9300343

Many types of velocity oscillations are observed in the umbrae and penumbrae of sunspots. We describe a project aimed at determining the source of one type of oscillation, the five-minute period photospheric umbra oscillations. The project uses imaging spectroscopy of spot umbrae, measuring the Doppler shift of pure umbral absorption lines to study the temporal and spatial properties of these oscillations. The Mees CCD (MCCD) instrument is an imaging spectroscopy device which uses the 25 cm coronagraph telescope and the 3.0 m coude spectrograph at Mees Solar Observatory (MSO) on Haleakala, Maui. The instrument works with resolving power up to R approx. 200,000 with significant throughput from lambda-3934 A (Ca II K) to lambda approx. 10000 A. A fast guiding active mirror stabilizes the image during observations. A rapidly writing magnetic tape storage system allows observations to be recorded at 256 Kbytes s(exp -1). We observed the oscillations in the umbrae of two sunspots using the MCCD imaging spectrograph. We observed the Doppler shifts of 18 molecular lines in the umbrae for roughly 50 hours in each spot during the interval of 11 to 16 May 1991. We find no simple correlation between the velocity measured with molecular lines and the velocity measured using two iron lines. We remove solar rotation, image drift, and interpolate all the data onto an even time grid. We perform four spatial analyses of the umbral velocity and find (1) there is more power traveling toward the center of the umbrae than leaving the center of the umbrae (this provides a direct measure of the absorption of p-modes by the sunspot umbrae), (2) the umbral oscillations have spatial and temporal characteristics indistinguishable from the quiet-sun oscillations, (3) a Fourier-Bessel analysis shows no obvious resonant frequencies which might represent natural oscillation modes of the sunspot umbrae, and (4) the centers of the umbrae have less RMS velocity than the edge of the umbrae. From these analyses we conclude that the photospheric umbral oscillations are driven by an external source and that source is the global p-mode oscillations. Dissert. Abstr.

MAGNETIC FIELD STRUCTURE AND COLLECTIVE EFFECTS IN SUPERNOVA REMNANTS Ph.D. Thesis
Craig Alan Wood 1992 206 p
Avail: Univ. Microfilms Order No. DA9235312

Observations of the northeast rim of the intermediate age SNR IC 443 obtained at 20.9 cm with the VLA have resolved the bright filamentary clouds. The cloud size is inconsistent with the evaporation length of isolated filamentary clouds. By considering collective evaporative effects among filamentary clouds using an analogous electrostatic model, an evaporation length consistent with the observations is found. In order to investigate magnetic field structure, a method quantifying the degree of organization of the local magnetic field in a region is presented. This method is applied to data from high resolution polarimetric observations of the filamentary structure in the northeast rim of IC 443 obtained at 6.1 cm with the VLA. The local magnetic field is found in organized regions preferentially located within the rim and correlated with regions of relatively high polarized intensity. The size scale of the largest organized region associated with IC 443 is approximately 85 arcsec (0.6 pc), and the apparent size scale of local field organization of the ambient ISM is approximately 35 arcsec (0.25 pc). The direction of the mean field in regions of high local field organization of IC 443 is generally oriented neither parallel nor perpendicular to the rim. Significant polarized brightness extends over 0.5 pc beyond the rim of IC 443 defined by the total intensity and probably represents the outer shock of the SN blast. The method is next applied to VLA data from the young remnant of Tycho's supernova (3C 10), where it is also found that the local magnetic field is organized into regions correlated with regions of relatively high polarized intensity. The size scale of the largest organized region associated with 3C 10 is approximately 110 arcsec (1.33 pc), and the apparent size scale of the local field organization of the ambient ISM is approximately 30 arcsec (0.36 pc). The direction of the mean field in regions of high local field organization within rim of 3C 10 is generally radial. Dissert. Abstr.

ANALYSIS OF IUE OBSERVATIONS OF HYDROGEN IN COMETS Final Report
Michael R. Combi and Paul D. Feldman (Johns Hopkins Univ., Baltimore, MD.) Mar. 1993 23 p
(Contract NAS5-30450; NAG5-1333; NsG-5393)
(NASA-CR-192693; NAS 1.26:192693) Avail: CASI HC A03/MF A01

The large body of hydrogen Lyman-alpha observations of cometary comae obtained with the International Ultraviolet Explorer satellite has gone generally unanalyzed because of two main modeling complications. First, the inner comae of many bright (gas productive) comets are often optically thick to solar Lyman-alpha radiation. Second, even in the case of a small

comet (low gas production) the large IUE aperture is quite small as compared with the immense size of the hydrogen coma, so an accurate model which properly accounts for the spatial distribution of the coma is required to invert the inferred brightnesses to column densities and finally to H atom production rates. Our Monte Carlo particle trajectory model (MPTM), which for the first time provides the realistic full phase space distribution of H atoms throughout the coma was used as the basis for the analysis of IUE observations of the inner coma. The MCPTM includes the effects of the vectorial ejection of the H atoms upon dissociation of their parent species (H2O and OH) and of their partial collisional thermalization. Both of these effects are crucial to characterize the velocity distribution of the H atoms. A new spherical radiative transfer calculation based on our MCPTM was developed to analyze IUE observations of optically thick H comae. The models were applied to observations of comets P/Giacobini-Zinner and P/Halley. Author (revised)

STUDIES OF COSMIC DUSTS USING SYNCHROTRON RADIATION Ph.D. Thesis
Stephen P. Thompson 1991 449 p
Avail: Univ. Microfilms Order No. BRDX97432

The structural characteristics of cosmic dusts and cosmic dust analogue materials are investigated using the Daresbury Laboratory synchrotron source. X-ray absorption spectroscopy is used to probe the local atomic environments of Fe and Ni atoms in iron meteorites and of Si atoms in heat treated synthetic Mg/Fe silicates and in commercially produced silicon carbide powders. Power diffraction (PD) is used to probe the long range order in matrix olivine samples from carbonaceous chondrite meteorite, silicon carbide polytypes, laboratory produced amorphous carbons and heat treated synthetic silicate samples. A 'restricted least squares convolution' procedure is developed to effect data smoothing and peak position identification via derivatives. The performance of this procedure and its relation to experimental parameters such as instrumental broadening are discussed in detail. Extended X-ray absorption fine structure (EXAFS) data are analyzed using both curved wave theory structural modelling and a novel technique of spectral synthesis. The latter is applied to iron meteorite EXAFS as a means of determining bulk Ni partitioning between BCC and FCC structural phases. Structural modelling is applied to both silicon carbide and synthetic silicate samples. The olivine 130 diffraction profiles of carbonaceous chondrite matrix materials are treated as being produced by olivine solid solutions, from which the percentage fosterite compositions are determined. PD features produced by amorphous carbon are interpreted in terms of microcrystalline graphite-like structure. PD is used to probe the evolution of crystalline structure within thermally processed synthetic Mg/Fe silicates. Dissert. Abstr.

THE STELLAR POPULATIONS OF EARLY-TYPE GALAXIES IN GROUPS AND CLUSTERS Ph.D. Thesis
Richard Gwyn Bower 1990 225 p
Avail: Univ. Microfilms Order No. BRD-97364

This thesis investigates the relationship between the environment of an early-type galaxy and its stellar populations. Most importantly, we wish to determine whether the star formation histories of early-type galaxies depend on the density of the group or cluster to which they belong. This issue is of considerable consequence, as it provides a means to distinguish whether the early-type morphology of these systems is determined at their formation, or whether it is assumed at a later time due to the action of their changing surroundings. We have applied two methods to compare the stellar populations of these galaxies. Firstly, we have analyzed the strengths of surface gravity sensitive spectral lines in order to compare the relative contributions of dwarf and giant stars to the blue light. Several samples of E and SO galaxies, drawn from a wide variety of environments, have been measured with this technique. Secondly, we have made a precise comparison of the broad-band colors of early-type galaxies in the Coma and Virgo clusters. These clusters have very different average densities, and distinctly disparate mixtures of galaxy morphological types. The findings of these studies appear to be contradictory, however. Although the surface gravity analysis indicates that early-type galaxies in lower density regions contain more substantial populations of relatively young stars, the broad-band colors of galaxies in the Virgo and Coma clusters are indistinguishable. A third section of the thesis develops the Press-Schechter theory for the evolution of gravitational structure in an expanding universe. Our work allows us to compare the past histories of the environments of galaxies as a function of the mass of the group or cluster to which they presently belong. In the final chapter, we discuss how the results from these three areas of research relate to each other, and suggest two ways in which the apparent paradox of our observational work may be resolved. Considering the implications of our theoretical work leads us to review the fundamental differences between the 'nature' and 'nurture' scenarios for the origin of galaxy morphology. Dissert. Abstr.

AN EXPERIMENTAL STUDY OF THE POSSIBLE ASSOCIATION OF DEEP UNDERGROUND MUONS WITH ASTRONOMICAL POINT SOURCES Ph.D. Thesis
Mark Andrew Thomson 1991 204 p
Avail: Univ. Microfilms Order No. BRD-97301

A sample of 5.6 million muons, recorded at a depth of 2090 mwe in the Soudan 2 detector between January 1989 and June 1991, has been examined for evidence of excess fluxes from Cygnus X-3 and other astronomical point sources. Software has been developed which routinely processes and corrects the data in order to achieve the optimum angular resolution. The reconstructed muon directions have been verified by a comparison with independent measurements from the proportional-tube veto shield which surrounds the detector. The angular resolution has been measured, from a sample of events containing two near-parallel muons, to be 1 degree. The alignment of the detector has been checked by comparing the observed spatial distribution of underground muons to that expected from the topology of the rock. A consideration of both angular resolution and systematic effects led to the a priori choice of a 2 degree cone as the optimum search region for Cygnus X-3. No overall (DC) or phase-modulated excess was observed from the direction of Cygnus X-3 and a 90 percent confidence level upper limit of less than 1.2 x 10(exp -11) cm(exp -2) s(exp -1) can be placed on the steady flux. The data were also examined for any evidence of excess muon fluxes correlated with the large radio flares of Cygnus X-3. Significant muon excesses, corresponding to fluxes of 7 x 10(exp -11) cm(exp -2) s(exp -1), were observed on the 20th and 23rd January 1991. The probability that such a correlation occurred by chance is estimated to be 1 in 1000. This observation has been compared with the results from extensive air shower arrays and other underground experiments. The results from one surface experiment provide possible confirmation of the Soudan result. The flux of underground muons from the observed gamma ray flux has been estimated and cannot explain the Soudan 2 observation. Dissert. Abstr.

OBSERVATIONS AND MODELING OF THE DUST AND GAS IN AN ISOLATED DIFFUSE INTERSTELLAR CLOUD Ph.D. Thesis
David Lawrence Shupe 1992 130 p
Avail: Univ. Microfilms Order No. DA9236069

We present comprehensive radio, infrared, and optical observations of a diffuse interstellar cloud, and calculate the expected emission from interstellar grains. The cloud is unique in being relatively tenuous and very sharply defined both spatially and in velocity, and provides an almost ideal laboratory for study of the diffuse interstellar medium. We have mapped with high resolution the atomic gas in the cloud via the 21 cm line. The maximum H I column density is 4 x 10(exp 20) H-atom cm(exp -2). Our sensitive search for carbon monoxide emission yielded an upper limit on the integrated CO intensity of 0.036 K km s(exp -1), suggesting that little or no molecular material is present in the cloud. We present data on the cloud in the 12, 25, 60, and 100 micron bands from the Infrared Astronomical Satellite. The I(sub nu)(100)/N(sub H) ratio is 0.52 plus or minus 0.05 x 10(exp -14) Jy sr(exp -1) sq cm, comparable to previous surveys of lower spatial resolution. The I(sub nu)(60)/I(sub nu)(100) ratio is 0.32 plus or minus 0.03, about 50 percent larger than average values. The grain distribution in the cloud may have been modified by shocks. We have performed deep optical imaging in the B, V, R, and I bands, and have detected emission from the cloud at the level of 27-28 magnitudes per square arcsecond. The optical colors of the cloud show a slight excess in the R and I bands over predictions of a simple scattering model. This excess is not as large as that found in other investigations and may indicate that the particles responsible for excess red emission are severely dehydrogenated. We calculate the infrared emission from a grain model

including stochastically heated small particles. To match the flux distribution of the cloud, 20 percent or more of the grain mass must consist of 5 A grains. We also compute photoelectric gas heating from these models and find that it is comparable with other estimates of heating and cooling. A very recent observational upper limit on (C(sub II)) emission from the cloud falls in the middle of the heating estimates. Dissert. Abstr.

NEUTRON STARS, STRANGE STARS, AND THE NUCLEAR EQUATION OF STATE
F. Weber and N. K. Glendenning 2 Nov. 1992 28 p Presented at the Workshop on Nuclear Physics in the Universe, Oak Ridge, TN, 24-26 Sep. 1992
(Contract DE-AC03-76SF-00098)
(DE93-004704; LBL-33066; CONF-9209239-3) Avail: CASI HC A03/MF A01

This article consists of three parts. In part one the present status of dense nuclear matter calculations are reviewed, and a representative collection of realistic nuclear equations of state which are derived for different assumptions about the physical behavior of dense matter (baryon population, pion condensation, possible transition of baryon matter to quark matter) is introduced. In part two, recently performed non-rotating and rotating compact star calculations performed for these equations of state are reviewed. The minimum stable rotational periods of compact stars whose knowledge is of decisive importance for the interpretation of rapidly rotating pulsars are determined. For this purpose two different limits on stable rotation are studied: rotation at the general relativistic Kepler period (below which mass shedding at the star's equator sets in), and, secondly, rotation at the gravitational radiation-reaction instability (at which emission of gravitational waves set in which slows the star down). In part three, the properties of hypothetical strange stars are discussed. Specifically, the amount of nuclear solid crust that can be carried by a rotating strange star is investigated and the question of whether such objects can give rise to the observed phenomena of pulsar glitches, which is at the present time the only astrophysical test of the strange-quark-matter hypothesis is answered. CHAOTIC EVOLUTION OF THE SOLAR SYSTEM
Gerald J. Sussman and Jack Wisdom Mar. 1992 20 p
(Contract N00014-89-J-3202)
(AD-A260055; AI-M-1359) Avail: CASI HC A03/MF A01

The evolution of the entire planetary system for nearly 100 million years was studied using a computer with an integration technique. This calculation confirms that the evolution of the solar system as a whole is chaotic, with a remarkably short timescale of exponential divergence of about 4 million years. Additional numerical experiments indicate that the dynamical evolution of the Jovian planets is chaotic apart from the rest of the system as is the motion of Pluto. GRA

THE KINEMATICS OF STARS AND GAS IN THE GALACTIC DISK Ph.D. Thesis
Adrian Robin Jenkins 1992 120 p
Avail: Univ. Microfilms Order No. BRD-97293

The Fokker-Planck equation, which describes the heating of a stellar disk under the combined influence of stochastic spiral structure and giant molecular clouds is solved by Monte Carlo simulation. It is found that disk heating by these two agents can adequately account for the velocity dispersions of young stars. An independent estimate of the present day local value of the cloud heating parameter, which determines the heating of the disk by clouds, is consistent with the results. The RMS amplitude of the potential of the spiral waves is estimated to be: delta phi is approximately (11 - 15 kms(exp -1))(exp 2). To account for the velocity dispersion of the disk as a whole requires a very much higher value of the cloud heating parameter in the early disk; alternatively, the velocities of the oldest stars may have some other origin. In the simulations, the disk is treated, at first, as having a fixed harmonic potential. The use of a more realistic anharmonic potential leads to essentially similar results. The influence of adiabatic effects due to the evolution of the vertical potential of the disk is investigated by modelling the disk as a 1-dimensional self-gravitating layer. It is found that adiabatic heating due to accretion, steepens the age-velocity relation but does not lead to any peculiar signature in the velocity distribution. The distribution of the stellar vertical velocities is predicted to be very close to isothermal in a population with a constant birth-rate. The gas dynamics in a rotating barred potential designed to simulate the Galactic center, is modelled. The gas is represented by particles which interact inelastically with each other. The modelling concentrates on reproducing a prominent feature seen in longitude-velocity (l-v) plots of the Galactic center, which Binney et al. have suggested is due to gas transferring from chi(sub 1) to chi(sub 2) orbits. The feature caused by this transfer is examined in the simulated l-v plots for a set of different viewing angles and bar axis ratios. The feature is enhanced by marking particles according to their collision history. Particles which have been strongly shocked are assumed to be made of H2. For some viewing angles the simulated feature is similar to the observations though the real feature is considerably less symmetric.

MOTION OF CHARGED PARTICLES IN PULSAR MAGNETOSPHERES Ph.D. Thesis
Haris Andrea Zachariades 1992 192 p
Avail: Univ. Microfilms Order No. DA9236636

The motion of charges in the magnetosphere of pulsars is studied from two complementary points of view: (1) for the case of aligned magnetic and rotational axes we solve a fluid version of the Lorentz-Dirac equation, in the Landau approximation, for a two-component plasma. We start from an approximately force-free initial condition and numerically integrate the equations of motion for a time equal to 1.6 percent of one stellar rotation period. We find that the system tends to a charge-separated state in which a negative charge region above the poles is separated by a vacuum gap from a positive charge region near the equator. We see the formation of force-free regions and a tendency of the vacuum gap to spread as the integrations proceed. The energies attained by the charges are only mildly relativistic and radiation reaction does not play an important role during the integrations. The negative charge above the polar region is electrostatically bound and there is a force-free region towards which negative charge tends to flow. Some positive charge is magnetically confined near the stellar equator and other positive charge crosses magnetic field lines moving outward to the region beyond the light cylinder. The outward motion of positive charge is due to the relative magnitudes of the electric and magnetic fields. (2) For the case of non-aligned axes we study the single particle dynamics for electrons moving in the region beyond the light cylinder, again using the Landau approximation to the Lorentz-Dirac equation. The effect of the inner magnetosphere is taken into account by adding a central attractive charge. We find that there exists a class of solutions corresponding to bounded orbits beyond the light cylinder. In an independent particle picture, particles started with different initial conditions within the basin of attraction of this class of orbits eventually form corotating patterns beyond the light cylinder. For a frequently occurring particle configuration we find emission from radio to gamma-ray frequencies with a spectrum different than that of synchrotron radiation. We also show the existence of phase locked dynamics for this system. These results suggest a possible structure of the outer magnetosphere of a non-aligned pulsar.

MID-INFRARED SPECTROSCOPY OF SOLIDS IN RELATION TO THE COMPOSITION OF INTERSTELLAR AND INTERGALACTIC DUST Ph.D. Thesis
Qasim S. Majeed 1990 261 p
Avail: Univ. Microfilms Order No. BRDX97472

The chemical and physical information on the composition and nature of interstellar grains is a long-standing problem in astrophysics. This information can, in principle, be determined from infrared observations of astronomical sources. Whilst a spectral feature near lambda = 3.4 micron can be assigned unambiguously to CH stretching in organic material, features near the wavelengths 10 and 20 microns are open to several interpretations. Alternative explanations fall into two broad categories: C-C, C-O and C-N stretching in organic grains on the one hand, and Si-O stretching in mineral grains on the other. However, detailed comparison between laboratory spectra of various crystalline and amorphous silicates and the features in several astronomical objects, including circumstellar dust shells around cool

stars, and in more extended sources as in the Trapezium nebula, are not satisfactory. In particular, silicates, whether they are of terrestrial or lunar origin, all show either too much structure or have their absorption peaks at the wrong wavelength. We obtained the infrared spectra of different organic, biological, and inorganic materials over the range 2.5-50 microns using a Perking-Elmer 783 series spectrophotometer. We compared these spectra with the 10 and 20 microns spectral features observed in objects in our galaxy and the external galaxies. A mixture of diatom silica with linked SiO4 tetrahedra together with organic grains characterized by the spectrum of an 'average' bacterium, provides excellent agreement with astronomical data relating to broad 10 and 20 microns emission and absorption features. Condensation of clay-like particles of radii 0.01 micron are most likely to occur in the atmospheres of Mira-type stars and be expelled by radiation pressure into interstellar space. These particles would tend to stick onto the surfaces of bacterial grains in conditions of high density associated with regions of star formation. The absorption and emission features at the 10 micron region of the circumstellar shell of cool carbon stars, OH/infrared sources, and the BN object, have been compared to that obtained from a composite model comprised of red crystal, diatom-silica, and 'average' bacteria. Good agreement between the astronomical data for these sources and the model has been obtained.

THE FORMATION OF ENHANCED, LOW-IONIZATION EMISSION IN GALACTIC HALOS Ph.D. Thesis
James Kurt Sokolowski 1992 225 p
Avail: Univ. Microfilms Order No. DA9234444

Recent observations have discovered pervasive, low-ionization gas with unusual excitation in the halos of nearby spiral galaxies. This has led to speculation concerning the excitation mechanisms operating at high galactic latitudes, including exotic processes involving nonequilibrium physics, local grain destruction and decaying dark matter. We demonstrate that the excitation conditions of the diffuse ionized media (DIMs) in several such objects, NGC 891, the Galaxy and NGC 1068, can be understood in terms of photoionization by the dominant radiation fields in their halos, if proper consideration is given to the spatial distributions of their stellar populations, the relative importance of nuclear continuum sources and subsequent radiative transfer. Estimation of the stellar populations in NGC 891 and the Galaxy indicates that OB stars, and the central stars of planetary nebulae dominate the excitation of their DIMs. Photoionization models require local DIM electron densities of order unity to reproduce the observed emission characteristics of the high-(z) gas. The DIM filling factor in NGC 891 is therefore restricted to the range 10(exp -3.5) approximately less than phi approximately less than 10(exp -1.5), while in the Galaxy phi approximately less than 10(exp -1.2) is suggested. Ionization equilibrium indicates that only approximately 5 percent of the total number of ionizing photons from OB stars escape the neutral disk, highlighting the importance of radiative transfer through the multiphase ISM. The DIM in NGC 1068 demonstrates a bipolar asymmetry common among active galaxies, with high-excitation emission confined to two diametric sectors aligned along the radio jet axis and low-excitation emission uniformly distributed over the disk. We show that this bipolar morphology can be understood using the developing picture of NGC 1068, in which its buried Type 1 Seyfert nucleus is visible only through scattered polarized light. The DIM excitation is therefore anisotropic, with high-excitation gas along the jet axis photoionized by direct nuclear continuum and low-excitation gas away from the axis, illuminated by indirect nuclear emission scattered into it. Photoionization models using power-law continua, indicate that the filling factor of this DIM is restricted to the range 10(exp -5) approximately less than phi approximately less than 10(exp -4) in order to reproduce the observed DIM emission characteristics.

THE STABILITY OF THICK, SELF-GRAVITATING DISKS IN PROTOSTELLAR SYSTEMS Ph.D. Thesis
John William Woodward 1992 233 p
Avail: Univ. Microfilms Order No. DA9301113

We perform a computational survey of the stability of protostellar systems which contain a self-gravitating disk. The systems are initially represented by a point mass M(sub c) at the center and a geometrically thick, axisymmetric disk of mass M(sub d) that supports uniform specific angular momentum and obeys an n = 3/2 polytropic equation of state. The equilibrium disk structure is uniquely defined upon the specification of two key dimensionless system parameters: M(sub d)/M(sub c) and T/W (the ratio of rotational kinetic energy of the disk to the gravitational potential energy of the system). The focus of this work is the identification of systems within the two-dimensional parameter space that are marginally unstable toward the development of nonaxisymmetric distortions. The geometric form of the disk's distortion and the likelihood of disk fragmentation as a result of such instabilities is examined with particular attention given to the formation of binary systems. The principal conclusions of this work are: (a) a computer code which results in data that does not require the application of numerical corrections is essential for the identification of marginally unstable models; (b) models in which the central object is constrained to remain at the center of mass of the system show two principal instabilities, one supplanting the other as the stability of cooler systems is explored; (c) models in which the central object is allowed to move and interact dynamically with the disk indicate that two new instabilities emerge. These new instabilities arise in disks that appear to be stable when the central object is constrained not to move. The instability occurring in the marginally unstable systems promotes the development of a tightly wound, one-armed spiral perturbation in the disk, and (d) disk fragmentation via the one-armed spiral mode is consistent with observations indicating that binary formation is the principal branch of the stellar formation process.

TEMPORAL AND SPATIAL INHOMOGENEITIES IN COMETS Ph.D. Thesis
Nalin Harsha Samarasinha 1992 255 p
Avail: Univ. Microfilms Order No. DA9234648

I have developed a time-dependent model to recover the production rate of a comet's outgassing species (molecules and dust) as a function of time from a series of photometric observations. The model has been applied to Comet Levy (1990c) to derive its dust production rate. Comparison of the dust production rate with spectroscopic data suggests that gaseous species must have a different temporal behavior from that of dust and is indicative of chemical heterogeneity of the nucleus of Comet Levy. I demonstrate using numerical simulations, that it is possible for CN jets seen in Comet P/Halley to evolve into CN shells as suggested by Schulz and Schlosser (1990). In indeed, this is the formation process of CN shells, the ejection velocity of CN in its precursor frame has to be much less than the outflow velocity of the precursors themselves. This rules out the canonical gaseous species as the precursor of CN radicals in CN jets and shells while favoring an origin in grains. In order to construct detailed models of the gaseous jets observed in Comet P/Halley, information about the rotational state of the nucleus is required. I have carried out an extensive search to determine all rotational state of Comet P/Halley which are capable of explaining a wide variety of observational data. I find that the orientation of the large end of the long axis during the Vega-1 encounter must be reversed from that suggested by Sagdeev et al. (1989) in order to satisfy some of the constraints. Neither pure rotations nor Short-Axis Modes are capable of satisfying the constraints. The most likely solutions are Long-Axis Modes. In the most likely modes for the rotational state, the long axis executes a precessional motion around the space-fixed total rotational angular momentum vector with a period near 3.7 days while performing a rotational motion around itself with a period of about 7.3 days. The direction of the total rotational angular momentum implies prograde rotation, but the exact coordinates are not well determined.

The Crab-Nebula continues to be the 'standard candle' of TeV gamma-ray astronomy. The Whipple Collaboration's observations of it are now confirmed by two French groups. Application of the 'supercuts' technique, developed on the Crab database, has resulted in the observation of a distant, active galaxy, Markarian 421. Markarian 421 is one of 16 active galactic nuclei (AGN's) observed by the EGRET instrument on the Compton Gamma Ray Observatory. The EGRET observations and the

expected attenuation of TeV photons from very distant AGN's gives added impetus to efforts in upgrading the present steoscopic detection system. The upgrade not only improves the sensitivity of the twin telescopes, but also reduces the energy threshold to 100 GeV, at which energy attenuation effects for distant sources are greatly reduced. During the past year the Ilm reflector was operated as a 37-pixel camera, with its performance matching design expectations. During the coming year, its camera will be upgraded to 109 pixels, the 10m camera electronics made to conform to the Ilm electronics, and both systems interfaced to a single, faster computer. Observations of Markarian 421, simultaneous with EGRET, are scheduled for May, 1993. DOE

INWARD ELECTROSTATIC PRECIPITATION OF INTERPLANETARY PARTICLES
Aaron J. Rulison, Richard C. Flagan, and Thomas J. Ahrens 24 Mar. 1993 31 p
(Grant NAGw-1941)
(NASA-CR-192786; NAS 1.26:192786) Avail: CASI HC A03/MF A01

An inward precipitator collects particles initially dispersed in a gas throughout either a cylindrical or spherical chamber onto a small central planchet. The instrument is effective for particle diameters greater than about 1 micron. One use is the collection of interplanetary dust particles (IDPs) which are stopped in a noble gas (xenon) by drag and ablation after perforating the wall of a thin-walled spacecraft-mounted chamber. First, the particles are positively charged for several seconds by the corona production of positive xenon ions from inward facing needles placed on the chamber wall. Then an electric field causes the particles to migrate toward the center of the instrument and onto the planchet. The collection time (on the order of hours for a 1 m radius spherical chamber) is greatly reduced by the use of optimally located screens which reapportion the electric field. Some of the electric field lines terminate on the wires of the screens so a fraction of the total number of particles in the chamber is lost. The operation of the instrument is demonstrated by experiments which show the migration of carbon soot particles with radius of approximately 1 micron in a 5 cm diameter cylindrical chamber with a single field enhancing screen toward a 3.2 mm central collection rod. IMPACT CONTRIBUTION OF PREBIOTIC REACTANTS TO EARTH Final Technical Report, 1 Apr. 1991 - 28 Feb. 1993
Hans R. Aggarwal 25 Mar. 1993 7 p
(Contract NCC2-722)
(NASA-CR-192785; NAS 1.26:192785) Avail: CASI HC A02/MF A01

A study was performed to explore the effectiveness of comets for chemical evolution. The concentration of amino acids in various terrestrial environments was mathematically explored as there is evidence that amino acids formed as a result of cometary impact. First, the initial concentration of amino acids in surface environment after cometary impact was estimated. The effect of hydrothermal vents, ultra-violet rays, and clays was taken into consideration. Next, the absorption of amino acids by clay particles before degradation by ultra-violet light was analyzed. Finally, the effectiveness of clays, ultra-violet, and hydrothermal vents as sinks for cometary amino acids was compared. A mathematical model was then developed for the production of impact deposits on Earth for the past 2 Ga, and the relative thickness distribution was computed for impact deposits produced in 2 Ga. The reported relative thickness distribution of tillites and diamicites of all ages agrees with the thickness calculated from this impact model. This suggests that many of the ancient tillites and diamicites could be of impact origin. The effectiveness of comets was explored on the chemical evolution of amino acids. The effect of sinks such as clays, submarine vents, and UV light on amino acid concentration was considered. Sites favorable to chemical evolution of amino acids were examined, and it was concluded that chemical evolution could have occurred at or above the surface even during periods of intense bombardment of the Earth more than 3.8 billion years ago. The photo absorption, photo dissociation, and fluorescence cross sections of interstellar molecules and radicals were measured in the vacuum ultraviolet region. These quantitative optical data are useful for understanding of the formation and destruction processes of molecules under the intense interstellar W radiation field. Infrared (IR) emissions from W excitation of aromatic molecules were also observed in this research program. The research results are useful for studying the sources of the 'unidentified' interstellar infrared (UIR) emission bands. Author (revised)

LUNAR SCIENCE MEASUREMENTS AND INSTRUMENTS FOR RESOURCE CHARACTERIZATION
D. Vaniman 1992 5 p Presented at the 4th Annual Symposium on Utilization of Local Planetary Resources, Tucson, AZ, 18-28 Feb. 1993
(Contract W-7405-eng-36)
(DE93-005436; LA-UR-92-4155; CONF-930248-1) Avail: CASI HC A01/MF A01

Resource characterization is a requirement for effective production of any product from planetary materials, whether that product is to be used locally or exported. The characterization required is not necessarily costly or extensive; for example, our current knowledge of lunar regolith is probably sufficient for it to be used immediately for shielding purposes. However, other products from regolith (e.g., oxygen and solar-wind gases) will require more thorough and particularly site-specific resource characterization before actual production commences. If global maps of the Moon are obtained by some combination of gamma ray, reflectance, X-ray fluorescence, and/or imaging methods, the task of targeting resource sites will be considerably improved. Once these sites are selected, however, they must be characterized on the ground. The product of this characterization should be useable maps that will maximize the product output and minimize wasted energy and effort. DOE

LASER-INDUCED BREAKDOWN SPECTROSCOPY FOR REMOTE ELEMENTAL ANALYSIS OF PLANETARY SURFACES
J. D. Blacic, D. R. Pettit, D. A. Cremers, and N. Roessler (McDonnell-Douglas Electronics Co., Saint Louis, MO.) 1992 12 p Presented at the International Symposium on Spectral Sensing Research, Maui, HI, 15-20 Nov. 1992
(Contract W-7405-eng-36)
(DE93-003865; LA-UR-92-3940; CONF-9211130-3) Avail: CASI HC A03/MF A01

One of the most fundamental pieces of information about any planetary body is the elemental and mineralogical composition of its surface materials. We are developing an instrument to obtain such data at ranges of up to several hundreds of meters using the technique of Laser-Induced Breakdown Spectroscopy, or LIBS. The elemental analysis is based on atomic emission spectroscopy of a laser-induced plasma or spark. A pulsed, diode-pumped ND:YAG laser of several hundred mJ optical energy is used to vaporize and electronically excite the constituent elements of a rock surface remotely located from the laser. Light emitted from the excited plasma is collected and introduced to the entrance slit of a small grating spectrometer. The spectrally dispersed spark light is detected with either a linear photodiode array or area CCD array. When the latter detector is used, the optical and spectrometer components of the LIBS instrument can also be used in a passive imaging mode to collect and integrate reflected sunlight from the same rock surface. Absorption spectral analysis of this reflected light gives mineralogical information that, when combined with the elemental analysis from the LIBS mode, provides a complete remote geochemical characterization of the rock surface. We have performed laboratory calibrations in air and in vacuum on standard rock powders to quantify the LIBS analysis. We have performed a preliminary field test using commonly available laboratory components to demonstrate remote LIBS analysis of terrestrial rock surfaces at ranges of over 25 meters. Based on these results, we believe that all major and most minor elements expected on planetary surfaces can be measured with absolute accuracy of 10-15 percent and much higher relative accuracy. SO2 ON VENUS: A FINAL CROSS-CALIBRATION WITH PIONEER VENUS Final Report

S. Alan Stern 1 Mar. 1993 18 p

(Grant NAG5-1913; SwRI Proj. 15-4914)

(NASA-CR-192273; NAS 1.26:192273) Avail: CASI HC A03/MF A01

In the present reporting period we have met with the Pioneer Venus PI to collaborate on the recalibration of the UV spectrometer of Pioneer Venus. The associated data reduction and analysis activities have been completed. The sensitivity of the UV spectrometer has been steadily declining since orbit insertion of Pioneer Venus in 1978 due to aging of the detector tubes. The sensitivity decline is a strong function of wavelength and the rate of decline is also a function of time. Measures were taken to reduce the light dose received by the instrument to slow down the sensitivity decline. The stellar calibration using the bright UV star Hadar in 1990 indicates that the sensitivity decline may have slowed down more than have been previously estimated. The derived amount of SO2 from Pioneer Venus depends on the accuracy of the absolute sensitivity of the UV spectrometer. The previous cross calibration between IUE and Pioneer Venus led to the use of the same solar flux data for reducing and modelling data from both IUE and Pioneer Venus. The comparison between the 1991 IUE results and the Pioneer Venus stellar calibration carried out in 1990 will allow a more accurate determination of sensitivity decline of the PV UV spectrometer. The result of this comparison will be crucial in determining the trend of SO2 in the Venus atmosphere.

WORKSHOP ON CHEMICAL WEATHERING ON MARS, PART 2

Roger Burns, ed. and Amos Banin, ed. 1992 15 p Workshop held at Cocoa Beach, FL, 10-12 Sep. 1992

(Contract NASw-4574)

(NASA-CR-192261; NAS 1.26:192261; LPI-TR-92-04-Pt-2) Avail: CASI HC A03/MF A01

The third Mars Surface and Atmosphere Through Time (MSATT) Workshop, which was held 10-12 Sep. 1992, at Cocoa Beach/Cape Kennedy, focused on chemical weathering of the surface of Mars. The 30 papers presented at the workshop described studies of Martian weathering processes based on results from the Viking mission experiments, remote sensing spectroscopic measurements, studies of the shergottite, nakhlite, and chassignite (SNC) meteorites, laboratory measurements of surface analog materials, and modeling of reaction pathways. A summary of the technical sessions is presented and a list of workshop participants is included.

POSSIBLE POWER SOURCES FOR THE JOVIAN POLAR INFRARED HOT SPOTS Ph.D. Thesis

Jie Zhan 1991 93 p

Avail: Univ. Microfilms Order No. DA9234448

Strong 8-micron infrared hot spots in the polar regions of Jupiter exhibit different behaviors: the northern polar hot spot (hereafter, NPHS) tends to remain fixed in System 3 longitude while the southern polar hot spot (SPHS) drifts. Joule heating associated with Pedersen currents that are generated by the spinning magnetized ionosphere (the Faraday disc dynamo) is proposed as a possible power source for the hot spots. A quantitative perturbation model is used to show that the NPHS is confined by a steep longitudinal magnetic-field gradient to a System 3 longitude of approximately 175 degrees, in agreement with observations. The model also shows that a Joule heating power of about 10(exp 14)-10(exp 15) Watts can be dissipated in the hydrocarbon layer, significantly larger than particle-precipitation power and the radiated power of the hot spots. The drift of the SPHS is hypothesized as being caused by gravity waves. The total energy provided by Joule heating and by the dissipation of the waves constitutes the power for the hot spot; propagation of the waves causes the location of the total energy deposition to move, thus causing the drift of the SPHS. Because of the asymmetry in the polar magnetic field configurations between the two hemispheres, these gravity waves are more likely to deposit energy comparable to the Joule heating energy in the south to heat up the hydrocarbon layer where IR emission originates. The ranges of wavelength and frequency are investigated for waves that propagate mainly in north-south direction. These waves can cause the SPHS to drift at the observed speed of approximately 5km/s and dissipate heat that is comparable to Joule heating in the south but less important than the Joule heating in the north. The current-driven joule-heating model, with the presence of wave modulation, can thus account for the primary features of the Jovian polar hot spots: their power output, the fixed location of the NPHS, and the drift motion of the SPHS.

GEOCHEMICAL MAPPING OF THE LUNAR SURFACE USING LASER-INDUCED ION MASS SPECTROMETRY FROM LANDERS AND ROVERS

H. O. Funsten, R. C. Elphic, J. D. Blacic, J. E. Borovsky, D. J. McComas, and J. E. Nordholt 1992 12 p Presented at the International Symposium on Spectral Sensing Research, Maui, HI, 15-20 Nov. 1992

(Contract W-7405-eng-36)

(DE93-003849; LA-UR-92-3821; CONF-9211130-1) Avail: CASI HC A03/MF A01

In-situ lunar geochemical assessment is essential when remotely prospecting for lunar resources or characterizing the mineralogy of a lunar site. We discuss a technique for lunar geochemical mapping from landed platforms using Laser-induced Ion Mass Spectrometry (LIMS). In this technique, a focused diode-pumped Nd:YAG laser on an lunar lander or rover vaporizes a thin layer of a soil or rock target located at a range of 1 to 100 m. The vapor is ionized through electron heating by inverse Bremsstrahlung, and the expanding plasma cloud contains information about the target composition. Ions in this plasma are analyzed using specialized time-of-flight ion mass spectrometry, providing detailed composition analysis of the lunar surface. In considering this technique, we discuss the effects on the ion trajectories of ambient electric and magnetic fields and present a high sensitivity, high mass-resolution mass spectrometer that is capable of detecting low atomic mass abundances, trace elements, and isotopic variations.

MODEL OF VENUS IONOPAUSE FORMATION Ph.D. Thesis

Mark John Matney 1992 149 p

Avail: Univ. Microfilms Order No. DA9234442

A model is presented that simulates the physics of the Venus mantle plasma. A modified magnetohydrodynamic (MHD) fluid picture is assumed where the post-shock solar wind plasma is mass-loaded by photoionizations and other atomic interactions with exospheric neutral atoms. By assuming Newtonian pressure profiles and draped magnetic field geometry in the mantle, the three-dimensional steady-state flow problem is reduced to a one-dimensional calculation along the stagnation (subsolar) flowline. In addition, the validity of the model assumptions and questions about the plasma thermodynamics are addressed. When the resulting model is run using various solar wind conditions, the computed magnetic field features correspond with those measured by the Pioneer Venus spacecraft. The model reproduces the observed region of sharp ion density gradients, known as the ionopause, that separates the mantle plasma from the denser ionospheric plasma below. The straightforward application of the model reproduces the shape and location of the low-altitude ionopause cases well, but for solar wind conditions that correlate with high-altitude ionopauses, the computed ionopauses tend to be lower than those observed. The addition of anomalous heating terms to the model, however, raises the computed ionopause to locations consistent with the medium altitude cases. The inability of the model to adequately describe the high altitude cases may indicate that they are transient events and thus cannot be simulated in steady state. While the source of the anomalous heating is not specified, the presence of hyperthermal ions or plasma-wave interactions are suggested as possible heating mechanisms.

NUMERICAL SIMULATION OF THE JOVIAN TORUS-DRIVEN PLASMA TRANSPORT Ph.D. Thesis

Yong-Shiang Yang 1992 288 p

Avail: Univ. Microfilms Order No. DA9234447

The Rice Convection Model has been modified and applied to the study of the Jovian magnetospheric system, which is interchange unstable. The basic interchange instability of the Io plasma torus is opposed by

pressure gradients in the energetic particles outside the torus. Many simulations have been performed for cases where the overall system is interchange unstable under the ideal-MHD assumption E + v x B = 0. For such cases, the torus breaks up predominantly into long fingers unless the initial condition strongly favors some other mode. The ends of the fingers tend to be rounded, and they are connected to the main torus by tails that thin rapidly with time if the torus runs out of plasma. Our calculations place an upper limit of approx. 1R(sub J) on the average distance between fingers. For an initially asymmetric large-scale torus, fingers generally form on a time scale shorter than the one on which the heavy side of the torus falls outwards. However, the fingers form predominantly on the heavy side. Galileo may observe such finger features outside the Io torus, at L approx. equals 7 to 15. Additionally, in this thesis, drift-wave theory has been used to investigate the effect of energetic (KeV or MeV) particles on the Io torus plasma transport. It is shown that the MHD stability criterion, where in the interchange motion would be completely stabilized if the energy density of the hot stabilizing plasma is greater than or dual to 3/4 of that of the cold unstable plasma, no longer holds owing to the gradient/curvature drift of the energetic particles. This differential-drift effect, which is a departure from the ideal-MHD and frozen-in flux, may play a significant role in plasma transport in the Jovian magnetosphere. Dissert. Abstr.

N93-24579 Oregon State Univ., Corvallis.
MODELING OF FORCED PLANETARY WAVES IN THE MARS ATMOSPHERE Ph.D. Thesis
Jeffery Lee Hollingsworth 1992 339 p
Avail: Univ. Microfilms Order No. DA9238049

Mariner 9 and Viking spacecraft observations during the 1970's have provided evidence for planetary-scale wave-like disturbances in the Mars atmosphere. It has been suggested that possible sources of the wave activity are dynamical instabilities (e.g., barotropic and/or baroclinic instabilities). Another candidate source is forced, quasi-stationary planetary waves. In connection with Mars' enormous relief, both mechanical forcing and large-scale thermal contrasts due to spatially varying surface thermal-inertia and albedo patterns should provide a strong source for planetary-wave activity. In this thesis, we attempt to model aspects of the observed wave activity, focusing on forced planetary waves in the wintertime atmosphere of Mars. Our approach is to apply two dynamical models: a linear primitive equations model and a quasi-linear 'wave, mean-flow' model. Both models have spherical geometry and represent deviations from zonal symmetry in terms of Fourier modes. The former model permits a separation of responses to different elements that make up the total forcing mechanism, whereas the latter is used principally to investigate the role forced planetary waves may play in the Mars polar warming phenomenon. Basic states representing relatively 'non-dusty' and 'highly dusty' conditions near winter solstice allow wavenumber-1 and -2 disturbances to propagate meridionally and vertically into the winter jet. Higher wavenumbers are strongly vertically trapped. Stationary waves in the northern and southern extratropics differ strongly in amplitude, phase and horizontal wave pattern. The possibility for near-resonant, long-period modes in Mars' winter atmosphere is also examined. For several wave-amplitude measures and dissipation strengths, dusty low-frequency responses are an order of magnitude larger than non-dusty ones. Wave, mean-flow simulations using wavenumber-1 or -2 forcings indicate north polar warmings can occur for the dusty basic states. The sensitivity (magnitude, location, and time scale) of a simulated warming to the wave forcing and the dissipation strength is investigated.

STUDIES OF EXTRA-SOLAR OORT CLOUDS AND THE KUIPER DISK Semiannual Report No. 2
S. Alan Stern 20 Mar. 1993 24 p
(Grant NAGw-3023; SwRI Proj. 15-4971)
(NASA-CR-192759; NAS 1.26:192759) Avail: CASI HC A03/MF A01

This is the second report for NAGW-3023, Studies of Extra-Solar Oort Clouds and the Kuiper Disk. We are conducting research designed to enhance our understanding of the evolution and detectability of comet clouds and disks. This area holds promise for also improving our understanding of outer solar system formation, the bombardment history of the planets, the transport of volatiles and organics from the outer solar system to the inner planets, and the ultimate fate of comet clouds around the Sun and other stars. According to 'standard' theory, both the Kuiper Disk and Oort Cloud are (at least in part) natural products of the planetary accumulation stage of solar system formation. One expects such assemblages to be a common attribute of other solar systems. Therefore, searches for comet disks and clouds orbiting other stars offer a new method for infering the presence of planetary systems. Our three-year effort consists of two major efforts: (1) observational work to predict and search for the signatures of Oort Clouds and comet disks around other stars; and (2) modelling studies of the formation and evolution of the Kuiper Disk (KD) and similar assemblages that may reside around other stars, including Beta Pic. These efforts are referred to as Task 1 and 2, respectively. Author (revised)

SOLAR MAXIMUM MISSION/ULTRAVIOLET SPECTROMETER AND POLARIMETER STUDIES Final Report
William Henze, Jr. Feb. 1993 45 p
(Contract NAS8-35921)
(NASA-CR-192463; NAS 1.26:192463; SP93-NASA-3405) Avail: CASI HC A03/MF A01

This final report for NASA Contract No. NAS8-35921 describes various studies performed for the Ultraviolet Spectrometer and Polarimeter (UVSP) experiment, one of several instruments on the Solar Maximum Mission (SMM) satellite which was launched on 14 February 1980. The UVSP consisted primarily of a Gregorian telescope and an Ebert-Fastie spectrometer with a polarimeter that could be inserted into the light path. The spacecraft and most of the instruments, including the UVSP, operated successfully until 23 November 1980, when part of the SMM attitude

control system (fine pointing control) failed. The UVSP was then unable to observe the Sun until 18 April 1984, when the SMM was visited by the space shuttle and the attitude control module was replaced by astronauts. The SMM mission ended when the spacecraft reentered the atmosphere of the Earth and was thereby destroyed on 2 December 1989. The topics covered in this report include the following: (1) ultraviolet stellar polarimetry (probably the first such attempted measurement); no polarization as detected and the upper limits, based on the sensitivity as determined by the observed count rate, are rather high; (2) an investigation into the possible position of the UVSP wavelength drive after it became stuck on 26 April 1985; (3) fast timing tests for sit-and-state observations involving one or two detectors; (4) development of computer subroutines to allow the calculation of the component of the SMM spacecraft orbital velocity along the line of sight to the Sun at any desired time during the 1984/1985 period when the UVSP wavelength drive was operating properly; (5) listing of published research papers; (6) description of the UVSP catalog of observations; and (7) description of UVSP calibration report and data users guide. AN MHD STUDY OF THE INTERACTION BETWEEN THE SOLAR WIND AND THE INTERSTELLAR MEDIUM Annual Progress Report

R. S. Steinolfson 15 Mar. 1993 4 p

(Grant NAGw-2621)

(NASA-CR-192353; NAS 1.26:192353) Avail: CASI HC A01/MF A01

The overall objective of this research program is to obtain a better understanding of the interaction between the solar wind and the interstellar medium through the use of numerical solutions of the time-dependent magnetohydrodynamic (MHD) equations. The simulated results will be compared with observations where possible and with the results from previous analytic and numerical studies. The primary progress during the first two years has been to develop codes for 2-D models in both spherical and cylindrical coordinates and to apply them to the solar wind-interstellar medium interaction. Computations have been carried out for both a relatively simple gas-dynamic interaction and a flow-aligned interstellar magnetic field. The results have been shown to compare favorably with models that use more approximations and to modify and extend the previous results as would be expected. Work has also been initiated on the development of a 3-D MHD code in spherical coordinates. Author

A MODIFIED FLOW/FIELD MODEL OF THE SOLAR WIND INTERACTION WITH MARS Ph.D. Thesis

Brian K. Stewart 1992 113 p

Avail: Univ. Microfilms Order No. DA9234445

A modified steady state flow/field model is applied to the direct interaction of the solar wind with the Martian ionosphere. The original flow/field model (Cloutier et al., 1987) is a one-dimensional, self-consistent derivation of differentials in vertical velocity, magnetic field, and ion densities from the coupled MHD equations. While successful in reproducing features of the ionosphere of Venus (Cloutier et al., 1987; McGary, 1987) and of Mars (Stewart, 1989), the flow/field model required an independently specified heating term (Q). The requirement of this term implies the presence of an energy source not accounted for in conventional calculations. This source was previously simulated with the inclusion of Q, but an unrecognized momentum or pressure term may also provide the coupling with the solar wind without the need of the free parameter Q. An in-depth analysis of Pioneer Venus data in relation to the total conservation of momentum of the system led to the discovery that the total momentum was in most cases not entirely accounted for, and that this 'missing' term was correlated with solar wind dynamic pressure. By including this missing pressure, a new set of differential equations, which were also extended to include horizontal velocity terms, was derived. Extrapolation of the missing pressure to Mars gave results that faithfully reproduced the ionospheric features associated with previous flow/field models while maintaining agreement with Viking 1 and 2 observations. Finally, we suggest that the source of P(sub missing) could be a population of suprathermal particles within the ionosphere. The missing pressures in the Viking simulations are consistent with measured suprathermal pressures at Mars (Hanson and Mantas, 1988). Dissert. Abstr.

THE SOLAR WIND CONTROL OF RECONNECTION AT THE DAYSIDE MAGNETOPAUSE Ph.D. Thesis

Leland Roy Scurry 1992 287 p

Avail: Univ. Microfilms Order No. DA9301549

The solar wind control of reconnection is examined using both correlation analysis of geomagnetic activity and in situ observations at the magnetopause. The correlation of geomagnetic activity, as measured by the am index, reveals a dependence of reconnection on the direction of the interplanetary magnetic field, the solar wind magnetosonic Mach number, and the solar wind dynamic pressure. In situ observations of accelerated flows and the magnetic normal component at the magnetopause using the ISEE 1 and 2 spacecraft are correlated with solar wind and magnetosheath parameters. The magnitude of the magnetic normal component is found to increase as the solar wind magnetic field clock angle becomes southward. The occurrence of accelerated flows increases with increasing southward field as well. Accelerated flows are found to occur with greater probability when the magnetosheath beta is low. Accelerated flows occur most often near the subsolar point. The direction and location of accelerated flows indicate the merging line tilts according to the direction of the interplanetary magnetic field with an average length of approximately 6 R(sub e). Dissert. Abstr.

WORLD DATA CENTER A FOR SOLAR-TERRESTRIAL PHYSICS. CATALOG OF CORONAL HOLES, 1970-1991

A. Sanchez-Ibarra and M. Barraza-Paredes Oct. 1992 75 p Prepared in cooperation with Universidad de Sonora, Hermosillo (Mexico), Centro de Investigacion en Fisica, and Centro de Investigacion en Astronomia Solar

(PB93-138469; UAG-102) Avail: CASI HC A04/MF A01

Coronal Holes were first noted as 'M' regions that produced periodic geomagnetic disturbances. These were first observed in 1970 by instruments on the Orbiting Solar Observatory (OSO) satellites, and also were noted with optical observations during the total solar eclipse of March 7, 1970. The Apollo Telescope Mount (ATM) on the Skylab manned mission observed in short wavelengths the real nature of Coronal Holes as regions of lower density and temperature than the rest of the solar corona. Three observational periods from Skylab produced substantial data on the development of Coronal Holes as well as their relationship with other types of solar activity. After Skylab, although Coronal Holes were later deduced from radio observations, the main data were obtained by observing the He I 10830A line at the Vacuum Solar Telescope at Kitt Peak National Observatory. These data, continuous from 1977 to date, were published in Solar-Geophysical Data (SGD) as Helium synoptic charts by Carrington Rotation or as Coronal Hole contours plotted on H-alpha synoptic charts. The Skylab observations of Coronal Holes were the subject of exhaustive examination. However, the main data source on Coronal Holes currently

are the synoptic maps published in SGD. This catalog was motivated by the lack of global reference guide. This catalog is based only on summary data for each Carrington Rotation; it presents interesting values and enough data to analyze several aspects of the evolution of Coronal Holes. GRA

OBSERVATION OF IMPULSIVE ACOUSTIC EVENTS AND THE EXCITATION OF SOLAR OSCILLATIONS Annual Report, 1 Nov. 1991 - 31 Oct. 1992
Sergio R. Restaino, Robin T. Stebbins, and Philip R. Goode 4 Dec. 1992 14 p
(Contract F49620-92-J-0094)
(AD-A259788; AFOSR-92-1008TR) Avail: CASI HC A03/MF A01

The five-minute solar oscillation has been exploited in numerous seismic studies in which internal properties of the Sun have been inferred. It is generally regarded that these modes are excited by turbulent convection in the Sun's outermost layers. The oscillatory wakes caused by impulsive events were observed, matching those described by Lamb (1909). These correspond to the events modeled by Goode, et al., which they associate with excitation of the global five-minute oscillations. GRA

GLOBAL SOLAR INTENSITY OSCILLATIONS NEAR SOLAR MAXIMUM Ph.D. Thesis
Robert Stephen Ronan 1992 116 p
Avail: Univ. Microfilms Order No. DA9300344

We report on the results of extended observations of global solar oscillations as measured in the Ca K spectral line. We measure p-mode frequency splittings averaged over the radial order of the oscillations modes. Our measurement of the antisymmetric component of the splittings is consistent with previous measurements. We present an inversion for the internal rotation rate as a function of latitude and radius in the convection zone and upper radiative zone from the observed antisymmetric splittings. This inversion reveals a slight increase in the rotation rate at all latitudes going inward from the surface to about 0.9 solar radii. Below this depth there is a decrease in the rotation rate with depth. Latitudinal differential rotation persists throughout much of the convection zone but decreases near the base of the convection zone. Our measurement of the symmetric component of the splittings is of the same order as was reported from the previous solar maximum and is an order of magnitude larger than has been measured near solar minimum. We find evidence for an aspherical fractional sound speed perturbation located at a depth of 0.85 plus or minus 0.05 solar radii. This perturbation has a magnitude of delta c/c approx. equals +9 x 10(exp -4) at the equator relative to the poles. If an internal global magnetic field is the dominant source of the observed symmetric component of the splittings instead of latitudinal gradients in the sound speed then global fields of order 10(exp 5) Gauss would be required in the convection zone. We detect high frequency counterparts to the global p-mode oscillations up to frequencies of 10 mHz in the intermediate degree range. The peak frequencies of the high frequency spectrum and the p-mode eigenfrequencies obey the same dispersion relationship (Duvall's Law) which is derived for the p-mode acoustic cavity. The high frequency 'modes' have linewidths which are roughly constant with frequency. Dissert. Abstr.

CHAOTIC DYNAMICS OF THE SOLAR CYCLE Annual Report, 1 Nov. 1991 - 30 Nov. 1992
Edward A. Spiegel 30 Nov. 1992 7 p
(Contract F49620-92-J-0061)
(AD-A260039; AFOSR-92-0996TR) Avail: CASI HC A02/MF A01

In modeling the solar cycle, we proceed on the assumption that the processes driving the solar cycle are deterministic. In that case, a chaotic model is a good choice for a description of its complexity. In our modeling, we suppose that the solar activity variation is composed of two distinct, coupled processes: one a conventionally chaotic system, and the other a nonlinear oscillator. This idea comes directly from our analysis of the observations. Since the sun's rotation period is one month, we do not use the daily sunspot number, but work with its monthly average. This quantity shows both the cyclic variation on the eleven year time scale and additional strong fluctuations. If we smooth the data to remove periods less than a year to two, we see the solar cycle clearly exposed. When we subtract this smoothed sunspot number from the monthly average, we obtain the fluctuations in the sunspot number. We show a comparison between the monthly averaged number and the fluctuations for a few cycles. There is a clear correlation between the level of solar activity, as measured by the sunspot number, and the amplitude of the fluctuations in this number. We suggest that the fluctuations and the cyclic behavior correspond to two distinct but interacting processes. GRA

ENVIRONMENTAL CONDITIONS RESPONSIBLE FOR SOLAR ACTIVITY Annual Technical Report, 1 Oct. 1991 - 1 Oct. 1992
Peter A. Sturrock 30 Nov. 1992 18 p
(Contract F49620-92-J-0015)
(AD-A259703; AFSOR-TR-92-1005) Avail: CASI HC A03/MF A01

This report describes progress toward understanding the theoretical basis for solar activity. One of our key accomplishments has been the insight we have gained into the eruption of coronal magnetic structures. Roumeliotis, Sturrock, and Antiochos have made numerical and analytic calculations which indicate that coronal magnetic fields being sheared by convective motions acting on their photospheric footpoints evolve smoothly until the shear surpasses a certain critical amount. After that, the coronal field exhibits very sensitive dependence on the photospheric boundary conditions, in the sense that small changes in the footpoint displacements produce huge changes in the height of the coronal field. We propose that this nonlinear behavior of sheared magnetic fields is the explanation for eruptive phenomena such as coronal mass ejections and solar flares. We are also developing several approaches for understanding coronal heating. In particular, Sturrock has proposed a model in which turbulent reconnection deep within the chromosphere produces local heating as well as a burst of magnetohydrodynamic waves that propagate upward to heat the corona. Roumeliotis is working on the theory that twisted flux loops in the corona undergo an internal resistive kink instability that unwinds the internal field and releases magnetic energy to heat the loop. (Contract N00014-90-J-1466)
(AD-A259781) Avail: CASI HC A07/MF A02

The study of solar flares and the interaction of solar flare radiations with the geospace environment is one of the most fundamental investigations in space science. Involved are basic questions about the mechanism for energy generation in the flare region, the conversion of this energy into high energy charged particles, neutrons, x-rays and gamma rays, the interplanetary propagation of the particles to Earth, the access of these particles to the magnetosphere, and the changes initiated in our local environment due to the solar flare. In the latter case, the solar particles are superposed upon an existing background of geomagnetically trapped and pseudo-trapped charged particles, which are themselves of fundamental importance in the dynamics of the geospace environment. While these questions are quite compelling scientifically, they also have important practical applications. The influence of solar activity and the consequent geomagnetic disturbances on the availability and quality of long range, short wave radio communication is perhaps the best known of the solar effects. With the advent of the space program and the ever increasing use of the space environment for both civilian and military applications, the consequences of space radiations are becoming a major operational concern since possible effects of such radiations include: the long-term degradation of hardware in the space environment, the abrupt failure of space systems due to a short-term event or even a single, intensely ionizing particle, and limitations imposed by the radiation environment on the human presence in orbit. The ability to assess the resulting operational limitations depends both on detailed knowledge of the geospace environment and its spatial and temporal variability and on the degree of sophistication of the space systems that are required to operate there. REMOTE SENSING OF INNER HELIOSPHERIC PLASMAS Annual Report, 15 Nov. 1991 - 14 Nov. 1992

Bernard V. Jackson 15 Dec. 1992 24 p

(Grant AF-AFOSR-0091-91)

(AD-A260337; AFOSR-TR-93-0026) Avail: CASI HC A03/MF A01

Solar disturbances produce major effects on the corona, the solar wind, the interplanetary medium, and the Earth along with its magnetosphere. New techniques for studying plasma disturbances in the inner heliosphere by remotely sensing them were developed. These techniques use data from the HELIOS spacecraft zodiacal light photometers, the ISEE-3 spacecraft kilometer radio-wave experiment, and a variety of other spacecraft and ground-based instruments. Use of interplanetary scintillation (IPS) data from the Cambridge, England radio telescope was added. The zodiacal-light photometers on board the two HELIOS spacecraft (data coverage from 1974 to 1986) provide the first good information about the heliospheric masses and shapes of propagating disturbances. Metric and kilometric type 2 and type 3 radiation caused by shock waves and fast moving electrons respectively are another way to remotely sense the structures which propagate outward from the Sun. The best kilometric radio-wave sensing of inner heliospheric plasma is available from the ISEE-3 spacecraft, and recently these data were used to obtain crude images of the Earth's magnetosphere. The investigations into the physics of the disturbances sensed by these techniques and the ability to forecast them are underway. GRA

The operations described in this report are separated into two sections, one involving the high-resolution sampling, analysis, and interpretation of a firn core from Windless Bight Antarctica and a second section concerned with the acquisition of a 120 meter firn core from the GISP2 site in Central Greenland. Most of the Antarctic work is involved with detailed correlation with records from two-drill cores located - 10 km apart on the Ross Ice Shelf where snow deposition involves little mixing and highly precise correlations are possible with known solar flare events. In Greenland, a much longer time period of roughly 400 years has been sampled. The core drilling was completed in June 1992 and the cores have been shipped to the National Ice Core Storage Facility in Denver, Colorado. The upper - 12 meters of firn core was analyzed on site in Greenland and shows that a high quality ice core record can be obtained. GRA

ANISOTROPIC REFLECTIONS IN MOUNTAINOUS TERRAIN TO DETERMINE THE ABSORPTION OF SOLAR RADIATION FROM SATELLITE DATA

Gerhard H. Ruppersberg (Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Cologne, Germany.) and Ruediger H. Bull Aug. 1992 56 p Transl. into ENGLISH of Anisotrope Reflexion im Gebirge: Ihre Bedeutung fuer die Bestimmung der Absorption solarer Strahlung aus Satellitendaten Original language document was announced as N92-14959

(ESA-TT-1262; DLR-FB-91-06; ETN-93-93517) Avail: CASI HC A04/MF A01; original German version available from DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

The anisotropic factors of quasi-three-dimensionally modeled areas in the Alps (Europe) with an extent of approximately 60 sq km are calculated for two wavelengths in the solar spectral region. For light snow cover, even simple assumptions concerning the reflection function of the elements of area return very accurate values of absorptance and radiation balance. With increasing snow cover, however, large errors can occur if reflection anisotropy of the snow fields is not adequately considered. With Meteosat measurements, anisotropic factors, f, are required which also take into account this effect, using NOAA AVHRR (Advanced Very High Resolution Radiometer) measured values and assuming that $f = 1$ already yields very accurate absorptances by imposing a restriction to the midday overpasses and positions of the areas around a nadir of +/- 273 km. MULTIPLE MOLECULAR SCATTERING AND ALBEDO ACTION ON THE SOLAR SPECTRAL IRRADIANCE IN THE REGION OF THE UVB (LESS THAN OR EQUAL TO 320 NM): A PRELIMINARY INVENTORY

Marcel Nicolet 1991 70 p Submitted for publication Sponsored by Commission of European Communities

(Aeronomica-Acta-A-363-1991; ETN-93-93537) Avail: Inst. d'Aeronomie Spatiale de Belgique, 3 Avenue Circulaire, B-1180 Brussels, Belgium

A study comparing, in the spectral UVB region, the various components of the solar radiation field in order to explain the large difference obtained in Apr. 1939 by Goetz in Chur (green meadows), Nicolet in Arosa (adequate

location in the snow) and Penndorf on the Weisshorn (above the ski slopes) (Switzerland) is presented. Numerical results from detailed theoretical calculations aimed at evaluating the various absolute effects associated with height, solar zenith angle and surface albedo were obtained for the standard atmosphere. The variations with solar zenith angles from 0 to 90 deg and albedos between 0 and 1 are presented for a spherical terrestrial atmosphere at selected wavelengths between 301 and 325 nm in the UVB region. From simultaneous measurements made at the same solar zenith angles, it was found that the values obtained in Arosa were between 5 and 10 times those obtained in Chur and on the Weisshorn. Such results are explained by a maximum of reflectivity of the snow covering the slope facing the relatively low Sun and its associated multiple scattered radiation in addition to the multiple molecular scattering of the atmosphere. NEW APPROACH TO THE INTERACTION OF COSMIC RAYS WITH NUCLEI IN SPACECRAFT SHIELDING AND THE HUMAN BODY
B. W. Bush and J. R. Nix Jan. 1993 50 p
(Contract W-7405-eng-36)
(DE93-006263; LA-12452-MS) Avail: CASI HC A03/MF A01

The interaction of high-energy cosmic rays with nuclei in spacecraft shielding and the human body is important for manned interplanetary missions and is not well understood either experimentally or theoretically. We present a new theoretical approach to this problem based on classical hadrodynamics for extended nucleons, which treats nucleons of finite size interacting with massive meson fields. This theory represents the classical analogue of the quantum hadrodynamics of Serot and Walecka without the assumptions of the mean-field approximation and point nucleons. It provides a natural covariant microscopic approach to collisions between cosmic rays and nuclei that automatically includes space-time non-locality and retardation, nonequilibrium phenomena, interactions among all nucleons, and particle production. Unlike previous models, this approach is manifestly Lorentz covariant and satisfies a priori the basic conditions that are present when cosmic rays collide with nuclei, namely an interaction time that is extremely short and a nucleon mean-free path, force range, and internucleon separation that are all comparable in size. We review the history of classical meson-field theory and derive the classical relativistic equations of motion for nucleons of finite size interacting with massive scalar and vector meson fields. GAMMA RAY PULSARS AND GEMINGA
M. Ruderman, J. P. Halpern (Columbia Univ., New York, NY.), K. Chen, and K. S. Cheng (Hong Kong Univ.) 1992 15 p Presented at the Gamma Ray Observatory Symposium, St. Louis, MO, 14-18 Oct. 1992
(Contract W-7405-eng-36)
(DE93-005452; LA-UR-92-4006; CONF-9210245-2) Avail: CASI HC A03/MF A01

Observed properties of gamma-ray pulsars are related to those of the accelerators which power their radiation. It is argued that the relatively slowly spinning Geminga is a strong gamma-ray source only because its magnetic dipole is more inclined than that of the more rapidly spinning Vela. This would also account for special Geminga properties including 180 degrees subpulse separation, soft x-ray spectra and intensities, and suppression of radio emission. DOE

POLARIZATION CORRECTION FOR IONIZATION LOSS IN A GALACTIC COSMIC RAY TRANSPORT CODE (HZETRN)
Judy L. Shinn, Hamidullah Farhat (Old Dominion Univ., Norfolk, VA.), Francis F. Badavi (Christopher Newport Coll., Newport News, VA.), and John W. Wilson Washington Mar. 1993 11 p
(RTOP 593-41-21-01)
(NASA-TM-4443; L-17192; NAS 1.15:4443) Avail: CASI HC A03/MF A01

An approximate polarization correction for ionization loss suggested by Sternheimer has been implemented in the galactic cosmic ray transport code (HZETRN) developed at the Langley Research Center. Sample calculations made for the aluminum shield and liquid hydrogen shield show no more than a plus or minus 2 percent change in the linear energy transfer (LET) distribution for flux compared with those without polarization correction. This very small change is expected because the effect of polarization correction on the reduction in stopping power of ions with energies above 2 GeV/amu is suppressed by the decrease in galactic cosmic ray ion flux at such high energies. (DE93-003823; LA-UR-92-3734; CONF-9210245-1) Avail: CASI HC A02/MF A01

Gamma-ray burst detectors are aboard three U.S. Air Force Defense Meteorological Satellite Program (DMSP) spacecraft, in orbit at 800 km altitude. A large number of bursts have been detected by DMSP, often

confirming and supplementing data from GRO and other spacecraft, sometimes detecting bursts not otherwise known. The position of an unknown source may be considerably restricted by knowledge of the several DMSP spacecraft locations and fields of view. These data may be of considerable assistance in understanding the gamma-ray burst phenomenon. DOE

The Transportable Applications Environment (TAE) Plus, developed at NASA's Goddard Space Flight Center, is an advanced portable user interface development which simplifies the process of creating and managing complex application graphical user interfaces (GUI's). TAE Plus supports the rapid prototyping of GUI's and allows applications to be ported easily between different platforms. This paper will discuss the capabilities of the TAE Plus tool, and how it makes the job of designing and developing GUI's easier for application developers. TAE Plus is being applied to many types of applications, and this paper discusses how it has been used both within and outside NASA. Author

ADVANCED DISPLAY OBJECT SELECTION METHODS FOR ENHANCING USER-COMPUTER PRODUCTIVITY **c61**
Glenn A. Osga *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 13-17 Sponsored in part by Office of Naval Technology (For primary document see N93-22149 08-99)
Avail: CASI HC A01/MF A04

The User-Interface Technology Branch at NCCOSC RDT&E Division has been conducting a series of studies to address the suitability of commercial off-the-shelf (COTS) graphic user-interface (GUI) methods for efficiency and performance in critical naval combat systems. This paper presents an advanced selection algorithm and method developed to increase user performance when making selections on tactical displays. The method has also been applied with considerable success to a variety of cursor and pointing tasks. Typical GUI's allow user selection by: (1) moving a

cursor with a pointing device such as a mouse, trackball, joystick, touchscreen; and (2) placing the cursor on the object. Examples of GUI objects are the buttons, icons, folders, scroll bars, etc. used in many personal computer and workstation applications. This paper presents an improved method of selection and the theoretical basis for the significant performance gains achieved with various input devices tested. The method is applicable to all GUI styles and display sizes, and is particularly useful for selections on small screens such as notebook computers. Considering the amount of work-hours spent pointing and clicking across all styles of available graphic user-interfaces, the cost/benefit in applying this method to graphic user-interfaces is substantial, with the potential for increasing productivity across thousands of users and applications. Avail: CASI HC A03/MF A04

This paper will discuss a two and a half year long project undertaken to develop an English-language interface for the geographical information system GRASS. The work was carried out for NASA by a small business, Netrologic, based in San Diego, California, under Phase 1 and 2 Small Business Innovative Research contracts. We consider here the potential value of this system whose current functionality addresses numerical, categorical and boolean raster layers and includes the display of point sets defined by constraints on one or more layers, answers yes/no and numerical questions, and creates statistical reports. It also handles complex queries and lexical ambiguities, and allows temporarily switching to UNIX or GRASS. Author

The exchange of Computer Aided Design (CAD) information between dissimilar CAD systems is a problem. This is especially true for transferring electronics CAD information such as multi-chip module (MCM), hybrid microcircuit assembly (HMA), and printed circuit board (PCB) designs. Currently, there exists several neutral data formats for transferring electronics CAD information. These include IGES, EDIF, and DXF formats. All these formats have limitations for use in exchanging electronic data. In an attempt to overcome these limitations, the Navy's MicroCIM program implemented a project to transfer hybrid microcircuit design information between dissimilar CAD systems. The IGES (Initial Graphics Exchange Specification) format is used since it is well established within the CAD industry. The goal of the project is to have a complete transfer of microelectronic CAD information, using IGES, without any data loss. An Application Protocol (AP) is being developed to specify how hybrid microcircuit CAD information will be represented by IGES entity constructs. The AP defines which IGES data items are appropriate for describing HMA geometry, connectivity, and processing as well as HMA material characteristics. Author

METHODS AND MEANS USED IN PROGRAMMING INTELLIGENT SEARCHES OF TECHNICAL DOCUMENTS **c82**

David L. Gross *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 55-62 (For primary document see N93-22149 08-99)

Avail: CASI HC A02/MF A04

In order to meet the data research requirements of the Safety, Reliability & Quality Assurance activities at Kennedy Space Center (KSC), a new computer search method for technical data documents was developed. By their very nature, technical documents are partially encrypted because of the author's use of acronyms, abbreviations, and shortcut notations. This problem of computerized searching is compounded at KSC by the volume of documentation that is produced during normal Space Shuttle operations. The Centralized Document Database (CDD) is designed to solve this problem. It provides a common interface to an unlimited number of files of various sizes, with the capability to perform any diversified types and levels of data searches. The heart of the CDD is the nature and capability of its search algorithms. The most complex form of search that the program uses is with the use of a domain-specific database of acronyms, abbreviations, synonyms, and word frequency tables. This database, along with basic sentence parsing, is used to convert a request for information into a relational network. This network is used as a filter on the original document file to determine the most likely locations for the data requested. This type of search will locate information that traditional techniques, (i.e., Boolean structured key-word searching), would not find. Author

AN INTEGRATED INFORMATION RETRIEVAL AND DOCUMENT MANAGEMENT SYSTEM **c82**

L. Stephen Coles, J. Fernando Alvarez, James Chen, William Chen, Lai-Mei Cheung, Susan Clancy, and Alexis Wong *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 63-72 (For primary document see N93-22149 08-99)

Avail: CASI HC A02/MF A04

This paper describes the requirements and prototype development for an intelligent document management and information retrieval system that will be capable of handling millions of pages of text or other data. Technologies for scanning, Optical Character Recognition (OCR), magneto-optical storage, and multiplatform retrieval using a Standard Query Language (SQL) will be discussed. The semantic ambiguity inherent in the English language is somewhat compensated-for through the use of coefficients or weighting factors for partial synonyms. Such coefficients are used both for defining structured query trees for routine queries and for establishing long-term interest profiles that can be used on a regular basis to alert individual users to the presence of relevant documents that may have just arrived from an external source, such as a news wire service. Although this attempt at evidential reasoning is limited in comparison with the latest developments in AI Expert Systems technology, it has the advantage of being commercially available. Author

AN INVESTIGATIVE STUDY OF MULTISPECTRAL DATA COMPRESSION FOR REMOTELY-SENSED IMAGES USING VECTOR QUANTIZATION AND DIFFERENCE-MAPPED SHIFT-CODING **c61**

S. Jaggi *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 73-88 (For primary document see N93-22149 08-99)

(Contract NAS13-315)

Avail: CASI HC A03/MF A04

A study is conducted to investigate the effects and advantages of data compression techniques on multispectral imagery data acquired by NASA's airborne scanners at the Stennis Space Center. The first technique used was vector quantization. The vector is defined in the multispectral imagery context as an array of pixels from the same location from each channel. The error obtained in substituting the reconstructed images for

the original set is compared for different compression ratios. Also, the eigenvalues of the covariance matrix obtained from the reconstructed data set are compared with the eigenvalues of the original set. The effects of varying the size of the vector codebook on the quality of the compression and on subsequent classification are also presented. The output data from the Vector Quantization algorithm was further compressed by a lossless technique called Difference-mapped Shift-extended Huffman coding. The overall compression for 7 channels of data acquired by the Calibrated Airborne Multispectral Scanner (CAMS), with an RMS error of 15.8 pixels was 195:1 (0.41 bpp) and with an RMS error of 3.6 pixels was 18:1 (.447 bpp). The algorithms were implemented in software and interfaced with the help of dedicated image processing boards to an 80386 PC compatible computer. Modules were developed for the task of image compression and image analysis. Also, supporting software to perform image processing for visual display and interpretation of the compressed/classified images was developed. Author

A MACRO-MICRO ROBOT FOR PRECISE FORCE APPLICATIONS c63
Neville I. Marzwell and Yulun Wang (Computer Motion, Inc., Goleta, CA.) *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 91-100 Sponsored in part by NSF (For primary document see N93-22149 08-99)
(Contract NAS7-1149)
Avail: CASI HC A02/MF A04

This paper describes an 8 degree-of-freedom macro-micro robot capable of performing tasks which require accurate force control. Applications such as polishing, finishing, grinding, deburring, and cleaning are a few examples of tasks which need this capability. Currently these tasks are either performed manually or with dedicated machinery because of the lack of a flexible and cost effective tool, such as a programmable force-controlled robot. The basic design and control of the macro-micro robot is described in this paper. A modular high-performance multiprocessor control system was designed to provide sufficient compute power for executing advanced control methods. An 8 degree of freedom macro-micro mechanism was constructed to enable accurate tip forces. Control algorithms based on the impedance control method were derived, coded, and load balanced for maximum execution speed on the multiprocessor system. Author

A FAULT-TOLERANT INTELLIGENT ROBOTIC CONTROL SYSTEM c63
Neville I. Marzwell and Kam Sing Tso (SoHaR, Inc., Beverly Hills, CA.) *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 101-110 (For primary document see N93-22149 08-99)
(Contract NAS7-1172)
Avail: CASI HC A02/MF A04

This paper describes the concept, design, and features of a fault-tolerant intelligent robotic control system being developed for space and commercial applications that require high dependability. The comprehensive strategy integrates system level hardware/software fault tolerance with task level handling of uncertainties and unexpected events for robotic control. The underlying architecture for system level fault tolerance is the distributed recovery block which protects against application software, system software, hardware, and network failures. Task level fault tolerance provisions are implemented in a knowledge-based system which utilizes advanced automation techniques such as rule-based and model-based reasoning to monitor, diagnose, and recover from unexpected events. The two level design provides tolerance of two or more faults occurring serially at any level of command, control, sensing, or actuation. The potential benefits of such a fault tolerant robotic control system include: (1) a minimized potential for damage to humans, the work site, and the robot itself; (2) continuous operation with a minimum of uncommanded motion in the presence of failures; and (3) more reliable autonomous operation providing increased efficiency in the execution of robotic tasks and decreased demand on human operators for controlling and monitoring the robotic servicing routines. MULTI-BEAM RANGE IMAGER FOR AUTONOMOUS OPERATIONS c36
Neville I. Marzwell, H. Sang Lee (Science and Engineering Services, Inc., Burtonsville, MD.), and R. Ramaswami (Science and Engineering Services, Inc., Burtonsville, MD.) *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 111-118 (For primary document see N93-22149 08-99)
(Contract NAS7-1186)
Avail: CASI HC A02/MF A04

For space operations from the Space Station Freedom the real time range imager will be very valuable in terms of refuelling, docking as well as space exploration operations. For these applications as well as many other robotics and remote ranging applications, a small potable, power efficient, robust range imager capable of a few tens of km ranging with 10 cm accuracy is needed. The system developed is based on a well known pseudo-random modulation technique applied to a laser transmitter combined with a novel range resolution enhancement technique. In this technique, the transmitter is modulated by a relatively low frequency of an order of a few MHz to enhance the signal to noise ratio and to ease the stringent systems engineering requirements while accomplishing a very high resolution. The desired resolution cannot easily be attained by other conventional approaches. The engineering model of the system is being designed to obtain better than 10 cm range accuracy simply by implementing a high precision clock circuit. In this paper we present the principle of the pseudo-random noise (PN) lidar system and the results of the proof of experiment. Author

ROBOSIM: AN INTELLIGENT SIMULATOR FOR ROBOTIC SYSTEMS c63
Kenneth R. Fernandez, George E. Cook (Vanderbilt Univ., Nashville, TN.), Csaba Biegl (Vanderbilt Univ., Nashville, TN.), and James F. Springfield (Vanderbilt Univ., Nashville, TN.) *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 119-125 (For primary document see N93-22149 08-99)
Avail: CASI HC A02/MF A04

The purpose of this paper is to present an update of an intelligent robotics simulator package, ROBOSIM, first introduced at Technology 2000 in 1990. ROBOSIM is used for three-dimensional geometrical modeling of robot manipulators and various objects in their workspace, and for the simulation of action sequences performed by the manipulators. Geometric modeling of robot manipulators has an expanding area of interest because it can aid the design and usage of robots in a number of ways, including: design and testing of manipulators, robot action planning, on-line control of robot manipulators, telerobotic user interface, and training and education. NASA developed ROBOSIM between 1985-88 to facilitate the development of robotics, and used the package to develop robotics for welding, coating, and space operations. ROBOSIM has been further developed for academic use by its co-developer Vanderbilt University, and has been in both classroom and laboratory environments for teaching complex robotic concepts. Plans are being formulated to make ROBOSIM available to all U.S. engineering/engineering technology schools (over three hundred total with an estimated 10,000+ users per year). Author

A THREE CHANNEL TELEMETRY SYSTEM c17
Jeffery C. Lesho and Harry A. C. Eaton *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 129-136 (For primary document see N93-22149 08-99)
(NASA Order S-92635)
Avail: CASI HC A02/MF A04

A three channel telemetry system intended for biomedical applications is described. The transmitter is implemented in a single chip using a 2 micron BiCMOS processes. The operation of the system and the test results from the latest chip are discussed. One channel is always dedicated to temperature measurement while the other two channels are generic. The generic channels carry information from transducers that are interfaced to the system through on-chip general purpose operational amplifiers. The generic channels have different bandwidths: one from dc to 250 Hz and the other from dc to 1300 Hz. Each generic channel modulates a current controlled oscillator to produce a frequency modulated signal. The two

frequency modulated signals are summed and used to amplitude modulate the temperature signal which acts as a carrier. A near-field inductive link telemeters the combined signals over a short distance. The chip operates on a supply voltage anywhere from 2.5 to 3.6 Volts and draws less than 1 mA when transmitting a signal. The chip can be incorporated into ingestible, implantable and other configurations. The device can free the patient from tethered data collection systems and reduces the possibility of infection from subcutaneous leads. Data telemetry can increase patient comfort leading to a greater acceptance of monitoring. Author

AUTOMATED SYSTEM FOR ANALYZING THE ACTIVITY OF INDIVIDUAL NEURONS **c52**
Isaac N. Bankman, Kenneth O. Johnson, Alex M. Menkes, Steve D. Diamond, and David M. OShaughnessy *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 138-145 (For primary document see N93-22149 08-99)
(Contract N00039-91-C-0001; NS-072226)
Avail: CASI HC A02/MF A04

This paper presents a signal processing system that: (1) provides an efficient and reliable instrument for investigating the activity of neuronal assemblies in the brain; and (2) demonstrates the feasibility of generating the command signals of prostheses using the activity of relevant neurons in disabled subjects. The system operates online, in a fully automated manner and can recognize the transient waveforms of several neurons in extracellular neurophysiological recordings. Optimal algorithms for detection, classification, and resolution of overlapping waveforms are developed and evaluated. Full automation is made possible by an algorithm that can set appropriate decision thresholds and an algorithm that can generate templates on-line. The system is implemented with a fast IBM PC compatible processor board that allows on-line operation. Author

IMPROVED INHALATION TECHNOLOGY FOR SETTING SAFE EXPOSURE LEVELS FOR WORKPLACE CHEMICALS **c52**
Bruce O. Stuart *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 146-149 (For primary document see N93-22149 08-99)
Avail: CASI HC A01/MF A04

Threshold Limit Values recommended as allowable air concentrations of a chemical in the workplace are often based upon a no-observable-effect-level (NOEL) determined by experimental inhalation studies using rodents. A 'safe level' for human exposure must then be estimated by the use of generalized safety factors in attempts to extrapolate from experimental rodents to man. The recent development of chemical-specific physiologically-based toxicokinetics makes use of measured physiological, biochemical, and metabolic parameters to construct a validated model that is able to 'scale-up' rodent response data to predict the behavior of the chemical in man. This procedure is made possible by recent advances in personal computer software and the emergence of appropriate biological data, and provides an analytical tool for much more reliable risk evaluation and airborne chemical exposure level setting for humans. ACTIVE HYDRAZINE VAPOR SAMPLER (AHVS) **c25**
Rebecca C. Young, Charles F. McBrearty (I-NET, Inc., Cocoa Beach, FL.), and Daniel J. Curran (I-NET, Inc., Cocoa Beach, FL.) *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 153-163 (For primary document see N93-22149 08-99)
Avail: CASI HC A03/MF A04

The Active Hydrazine Vapor Sampler (AHVS) was developed to detect vapors of hydrazine (HZ) and monomethylhydrazine (MMH) in air at parts-per-billion (ppb) concentration levels. The sampler consists of a commercial personal pump that draws ambient air through paper tape treated with vanillin (4-hydroxy-3-methoxybenzaldehyde). The paper tape is sandwiched in a thin cardboard housing inserted in one of the two specially designed holders to facilitate sampling. Contaminated air reacts with vanillin to develop a yellow color. The density of the color is proportional to the concentration of HZ or MMH. The AHVS can detect 10 ppb in less than 5 minutes. The sampler is easy to use, low cost, and intrinsically safe and contains no toxic material. It is most beneficial for use in locations with no laboratory capabilities for instrumentation calibration. This paper reviews the development, laboratory test, and field test of the device. Author

COP IMPROVEMENT OF REFRIGERATOR/FREEZERS, AIR-CONDITIONERS, AND HEAT PUMPS USING NONAZEOTROPIC REFRIGERANT MIXTURES **c31**
Douglas G. Westra *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 164-173 (For primary document see N93-22149 08-99)
Avail: CASI HC A02/MF A04

With the February, 1992 announcement by President Bush to move the deadline for outlawing CFC (chloro-fluoro-carbon) refrigerants from the year 2000 to the year 1996, the refrigeration and air-conditioning industries have been accelerating their efforts to find alternative refrigerants. Many of the alternative refrigerants being evaluated require synthetic lubricants, are less efficient, and have toxicity problems. One option to developing new, alternative refrigerants is to combine existing non-CFC refrigerants to form a nonazeotropic mixture, with the concentration optimized for the given application so that system COP (Coefficient Of Performance) may be maintained or even improved. This paper will discuss the dilemma that industry is facing regarding CFC phase-out and the problems associated with CFC alternatives presently under development. A definition of nonazeotropic mixtures will be provided, and the characteristics and COP benefits of nonazeotropic refrigerant mixtures will be explained using thermodynamic principles. Limitations and disadvantages of nonazeotropic mixtures will be discussed, and example systems using such mixtures will be reviewed. Author

VARIABLE-VOLUME FLUSHING (V-VF) DEVICE FOR WATER CONSERVATION IN TOILETS **c54**
Louis J. Jasper, Jr. *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 175-179 (For primary document see N93-22149 08-99)
Avail: CASI HC A01/MF A04

Thirty five percent of residential indoor water used is flushed down the toilet. Five out of six flushes are for liquid waste only, which requires only a fraction of the water needed for solid waste. Designers of current low-flush toilets (3.5-gal. flush) and ultra-low-flush toilets (1.5-gal. flush) did not consider the vastly reduced amount of water needed to flush liquid waste versus solid waste. Consequently, these toilets are less practical than desired and can be improved upon for water conservation. This paper describes a variable-volume flushing (V-VF) device that is more reliable than the currently used flushing devices (it will not leak), is simple, more economical, and more water conserving (allowing one to choose the amount of water to use for flushing solid and liquid waste). Avail: CASI HC A02/MF A04

The system-level software onboard a spacecraft is responsible for recovery from communication, power, thermal, and computer-health anomalies that may occur. The recovery must occur without disrupting any critical scientific or engineering activity that is executing at the time of the error. Thus, the error-recovery software may have to execute concurrently with the ongoing acquisition of scientific data or with spacecraft maneuvers. This work provides a technique by which the rules that constrain the concurrent execution of these processes can be modeled in a graph. An algorithm is described that uses this model to validate that the constraints hold for all concurrent executions of the error-recovery software with the software that controls the science and engineering activities of the spacecraft. The results are applicable to a variety of control systems with critical constraints on the timing and ordering of the events they control.

Understanding risks and avoiding failure are daily concerns for the women and men of NASA. Although NASA's mission propels us to push the limits of technology, and though the risks are considerable, the NASA community has instilled within, the determination to preserve the integrity of the systems upon which our mission and, our employees lives and well-being depend. One of the ways this is being done is by expanding and improving the tools used to perform risk assessment. The Failure Environment Analysis Tool (FEAT) was developed to help engineers and analysts more thoroughly and reliably conduct risk assessment and failure analysis. FEAT accomplishes this by providing answers to questions regarding what might have caused a particular failure; or, conversely, what effect the occurrence of a failure might have on an entire system. Additionally, FEAT can determine what common causes could have resulted in other combinations of failures. FEAT will even help determine the vulnerability of a system to failures, in light of reduced capability. FEAT also is useful in training personnel who must develop an understanding of particular systems. FEAT facilitates training on system behavior, by providing an automated environment in which to conduct 'what-if' evaluation. These types of analyses make FEAT a valuable tool for engineers and operations personnel in the design, analysis, and operation of NASA space systems.

Multimedia is making an increasingly significant contribution to our informational society. The usefulness of this technology is already evident in education, business presentations, informational kiosks (e.g., in museums), training and the entertainment environment. Institutions, from grade schools to medical schools, are exploring the use of multifaceted electronic text books and teaching aids to enhance course materials. Through multimedia, teachers and students can take full advantage of the cognitive value of animation, audio, video and other types in a seamless application. The Software Technology Branch at NASA Johnson Space Center (NASA/JSC) is taking similar approaches to apply the state-of-the-art technology to space training, mission operations and other applications. This paper discusses the characteristics and development of multimedia applications at the NASA/JSC.

MICRO-VIDEO DISPLAY WITH OCULAR TRACKING AND INTERACTIVE VOICE CONTROL c60
James E. Miller *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 227-234 Prepared for Foster-Miller Associates, Inc., Waltham, MA (For primary document see N93-22149 08-99)
Avail: CASI HC A02/MF A04

In certain space-restricted environments, many of the benefits resulting from computer technology have been foregone because of the size, weight, inconvenience, and lack of mobility associated with existing computer interface devices. Accordingly, an effort to develop a highly miniaturized and 'wearable' computer display and control interface device, referred to as the Sensory Integrated Data Interface (SIDI), is underway. The system incorporates a micro-video display that provides data display and ocular tracking on a lightweight headset. Software commands are implemented by conjunctive eye movement and voice commands of the operator. In this initial prototyping effort, various 'off-the-shelf' components have been integrated into a desktop computer and with a customized menu-tree software application to demonstrate feasibility and conceptual capabilities. When fully developed as a customized system, the interface device will allow mobile, 'hand-free' operation of portable computer equipment. It will thus allow integration of information technology applications into those restrictive environments, both military and industrial, that have not yet taken advantage of the computer revolution. This effort is Phase 1 of Small Business Innovative Research (SBIR) Topic number N90-331 sponsored by the Naval Undersea Warfare Center Division, Newport. The prime contractor is Foster-Miller, Inc. of Waltham, MA.

VIDEO CONFERENCING MADE EASY c32
D. Gail Larsen and Paul R. Schwieder *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 235-241 (For primary document see N93-22149 08-99)
(Contract DE-AC07-76ID-01570)
Avail: CASI HC A02/MF A04

Network video conferencing is advancing rapidly throughout the nation, and the Idaho National Engineering Laboratory (INEL), a Department of Energy (DOE) facility, is at the forefront of the development. Engineers at INEL/EG&G designed and installed a very unique DOE videoconferencing system, offering many outstanding features, that include true multipoint conferencing, user-friendly design and operation with no full-time operators required, and the potential for cost effective expansion of the system. One area where INEL/EG&G engineers made a significant contribution to video conferencing was in the development of effective, user-friendly, end station driven scheduling software. A PC at each user site is used to schedule conferences via a windows package. This software interface provides information to the users concerning conference availability, scheduling, initiation, and termination. The menus are 'mouse' controlled. Once a conference is scheduled, a workstation at the hubs monitors the network to initiate all scheduled conferences. No active operator participation is required once a user schedules a conference through the local PC; the workstation automatically initiates and terminates the conference as scheduled. As each conference is scheduled, hard copy notification is also printed at each participating site. Video conferencing is the wave of the future. The use of these user-friendly systems will save millions in lost productivity and travel cost throughout the nation. The ease of operation and conference scheduling will play a key role on the extent industry uses this new technology. The INEL/EG&G has developed a prototype scheduling system for both commercial and federal government use.

The Kansas City Division of Allied Signal Inc., as part of the Integrated Flexible Manufacturing Program (IFMP), is developing an integrated manufacturing environment. Several systems are being developed to produce standards and automation tools for specific activities within the manufacturing environment. The Advanced Manufacturing Development System (AMDS) is concentrating on information standards (STEP) and product data transfer; the Expert Cut Planner system (XCUT) is concentrating on machining operation process planning standards and automation capabilities; the Advanced Numerical Control system (ANC) is concentrating on NC data preparation standards and NC data generation tools; the Inspection Planning and Programming Expert system (IPPEX) is concentrating on inspection process planning, coordinate measuring machine (CMM) inspection standards and CMM part program generation tools; and the Intelligent Scheduling and Planning System (ISAPS) is concentrating on planning and scheduling tools for a flexible manufacturing system environment. All of these projects are working together to address information exchange, standardization, and information sharing to support rapid prototyping in a Flexible Manufacturing System (FMS) environment. AUTOMATED FIBER PLACEMENT COMPOSITE MANUFACTURING: THE MISSION AT MSFC'S PRODUCTIVITY ENHANCEMENT COMPLEX c31
John H. Vickers and Larry I. Pelham (Thiokol Corp., Huntsville, AL.) *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 255-261 (For primary document see N93-22149 08-99)
Avail: CASI HC A02/MF A04

Automated fiber placement is a manufacturing process used for producing complex composite structures. It is a notable leap to the state-of-the-art in technology for automated composite manufacturing. The fiber placement capability was established at the Marshall Space Flight Center's (MSFC) Productivity Enhancement Complex in 1992 in collaboration with Thiokol Corporation to provide materials and processes research and development, and to fabricate components for many of the Center's Programs. The Fiber Placement System (FPX) was developed as a distinct solution to problems inherent to other automated composite manufacturing systems. This equipment provides unique capabilities to build composite parts in complex 3-D shapes with concave and other asymmetrical configurations. Components with complex geometries and localized reinforcements usually require labor intensive efforts resulting in expensive, less reproducible components; the fiber placement system has the features necessary to overcome these conditions. The mechanical systems of the equipment have the motion characteristics of a filament winder and the fiber lay-up attributes of a tape laying machine, with the additional capabilities of differential tow payout speeds, compaction and cut-restart to selectively place the correct number of fibers where the design dictates. This capability will produce a repeatable process resulting in lower cost and improved quality and reliability. Author

LEARNING CHARACTERISTICS OF A SPACE-TIME NEURAL NETWORK AS A TETHER SKIPROPE OBSERVER c18
Robert N. Lea, James A. Villarreal, Yashvant Jani (Togai InfraLogic, Inc., Houston, TX.), and Charles Copeland (Loral Space Information Systems, Houston, TX.) *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 262-273 (For primary document see N93-22149 08-99)
Avail: CASI HC A03/MF A04

The Software Technology Laboratory at the Johnson Space Center is testing a Space Time Neural Network (STNN) for observing tether oscillations present during retrieval of a tethered satellite. Proper identification of tether oscillations, known as 'skiprope' motion, is vital to safe retrieval of the tethered satellite. Our studies indicate that STNN has certain learning characteristics that must be understood properly to utilize this type of neural network for the tethered satellite problem. We present our findings on the learning characteristics including a learning rate versus momentum performance table. Author

WIRELESS INFRARED COMMUNICATIONS FOR SPACE AND TERRESTRIAL APPLICATIONS c32
James W. Crimmins *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 277-280 (For primary document see N93-22149 08-99)
Avail: CASI HC A01/MF A04

Voice and data communications via wireless (and fiberless) optical means has been commonplace for many years. However, continuous advances in optoelectronics and microelectronics have resulted in significant advances in wireless optical communications over the last decade. Wilton has specialized in diffuse infrared voice and data communications since 1979. In 1986, NASA Johnson Space Center invited Wilton to apply its wireless telecommunications and factory floor technology to astronaut voice communications aboard the shuttle. In September, 1988 a special infrared voice communications system flew aboard a 'Discovery' Shuttle mission as a flight experiment. Since then the technology has been further developed, resulting in a general purpose of 2Mbs wireless voice/data LAN which has been tested for a variety of applications including use aboard Spacelab. Funds for Wilton's wireless IR development were provided in part by NASA's Technology Utilization Office and by the NASA Small Business Innovative Research Program. As a consequence, Wilton's commercial product capability has been significantly enhanced to include diffuse infrared wireless LAN's as well as wireless infrared telecommunication systems for voice and data. FLEXIBLE HIGH SPEED CODEC c33
James V. Wernlund *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 281-288 (For primary document see N93-22149 08-99)
(Contract NAS3-25087)
Avail: CASI HC A02/MF A04

HARRIS, under contract with NASA Lewis, has developed a hard decision BCH (Bose-Chaudhuri-Hocquenghem) triple error correcting block CODEC ASIC, that can be used in either a bursted or continuous mode. the ASIC contains both encoder and decoder functions, programmable lock thresholds, and PSK related functions. The CODEC provides up to 4 dB of coding gain for data rates up to 300 Mbps. The overhead is selectable from 7/8 to 15/16 resulting in minimal band spreading, for a given BER. Many of the internal calculations are brought out enabling the CODEC to be incorporated in more complex designs. The ASIC has been tested in BPSK, QPSK and 16-ary PSK link simulators and found to perform to within 0.1 dB of theory for BER's of 10(exp -2) to 10(exp -9). The ASIC itself, being a hard decision CODEC, is not limited to PSK modulation formats. Unlike most hard decision CODEC's, the HARRIS CODEC doesn't upgrade BER performance significantly at high BER's but rather becomes transparent. Author

ULTRA-STABLE, LOW PHASE NOISE DIELECTRIC RESONATOR STABILIZED OSCILLATORS FOR MILITARY AND COMMERCIAL SYSTEMS c33
Muhammad Mizan, Thomas Higgins, and Dana Sturzebecher *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 289-295 (For primary document see N93-22149 08-99)
Avail: CASI HC A02/MF A04

EPSD has designed, fabricated and tested, ultra-stable, low phase noise microwave dielectric resonator oscillators (DRO's) at S, X, Ku, and K-bands, for potential application to high dynamic range and low radar cross section target detection radar systems. The phase noise and the temperature stability surpass commercially available DROs. Low phase noise signals are critical for CW Doppler radars, at both very close-in and large offset frequencies from the carrier. The oscillators were built without any temperature compensation techniques and exhibited a temperature stability of 25 parts per million (ppm) over an extended temperature range. The oscillators are lightweight, small and low cost compared to BAW & SAW oscillators, and can impact commercial systems such as telecommunications,

built-in-test equipment, cellular phone and satellite communications systems. The key to obtaining this performance was a high Q factor resonant structure (RS) and careful circuit design techniques. The high Q RS consists of a dielectric resonator (DR) supported by a low loss spacer inside a metal cavity. The S and the X-band resonant structures demonstrated loaded Q values of 20,300 and 12,700, respectively. Author

EXCIMER LASER PROCESSING OF BACKSIDE-ILLUMINATED CCDS **c36**

S. D. Russell *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 296-303 (For primary document see N93-22149 08-99)

Avail: CASI HC A02/MF A04

An excimer laser is used to activate previously implanted dopants on the backside of a backside-illuminated CCD. The controlled ion implantation of the backside and subsequent thin layer heating and recrystallization by the short wavelength pulsed excimer laser simultaneously activates the dopant and anneals out implant damage. This improves the dark current response, repairs defective pixels and improves spectral response. This process heats a very thin layer of the material to high temperatures on a nanosecond time scale while the bulk of the delicate CCD substrate remains at low temperature. Excimer laser processing backside-illuminated CCD's enables salvage and utilization of otherwise nonfunctional components by bringing their dark current response to within an acceptable range. This process is particularly useful for solid state imaging detectors used in commercial, scientific and government applications requiring a wide spectral response and low light level detection. APPLICATIONS OF FIBROUS SUBSTRATES CONTAINING INSOLUBILIZED PHASE CHANGE POLYMERS **c37**

Tyrone L. Vigo and Joseph S. Bruno *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 307-316 (For primary document see N93-22149 08-99)

Avail: CASI HC A02/MF A04

Incorporation of polyethylene glycols into fibrous substrates produces several improved functional properties when they are insolubilized by crosslinking with a methylolamide resin or by polyacetal formation by their reaction with glyoxal. The range of molecular weights of polyols that may be insolubilized is broad as are the curing conditions (0.25-10 min at 80-200C). Most representative fiber types and blends (natural and synthetic) and all types of fabric constructions (woven, nonwoven and knit) have been modified by incorporation of the bound polyols. The most novel property is the thermal adaptability of the modified substrates to many climatic conditions. This adaptability is due to the high latent heat of the crosslinked polyols that function as phase change materials, the hydrophilic nature of the crosslinked polymer and its enhanced thermal conductivity. Other enhanced properties imparted to fabrics include flex and flat abrasion, antimicrobial activity, reduced static charge, resistance to oily soils, resiliency, wind resistance and reduced lint loss. Applications commercialized in the U.S. and Japan include sportswear and skiwear. Several examples of electric sets of properties useful for specific end uses are given. In addition, other uses are biomedical horticultural, aerospace, indoor insulation, automotive interiors and components and packaging material. Author

RUST TRANSFORMATION/RUST COMPATIBLE PRIMERS **c27**

Dario A. Emeric and Christopher E. Miller *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 317-323 (For primary document see N93-22149 08-99)

Avail: CASI HC A02/MF A04

Proper surface preparation has been the key to obtain good performance by a surface coating. The major obstacle in preparing a corroded or rusted surface is the complete removal of the contaminants and the corrosion products. Sandblasting has been traditionally used to remove the corrosion products before painting. However, sandblasting can be expensive, may be prohibited by local health regulations and is not applicable in every situation. To get around these obstacles, Industry developed rust converters/rust transformers and rust compatible primers (high solids epoxies). The potential use of these products for military equipment led personnel of the Belvoir Research, Development and Engineering Center (BRDEC) to evaluate the commercially available rust transformers and rust compatible primers. Prior laboratory experience with commercially available rust converters, as well as field studies in Hawaii and Puerto Rico, revealed poor performance, several inherent limitations, and lack of reliability. It was obvious from our studies that the performance of rust converting products was more dependent on the amount and type of rust present, as well as the degree of permeability of the coating, than on the product's ability to form an organometallic complex with the rust. Based on these results, it was decided that the Military should develop their own rust converter formulation and specification. The compound described in the specification is for use on a rusted surface before the application of an organic coating (bituminous compounds, primer or topcoat). These coatings should end the need for sandblasting or the removing of the adherent corrosion products. They also will prepare the surface for the application of the organic coating. Several commercially available rust compatible primers (RCP) were also tested using corroded surfaces. All of the evaluated RCP failed our laboratory tests for primers. Author

AN X RAY SCATTER APPROACH FOR NON-DESTRUCTIVE CHEMICAL ANALYSIS OF LOW ATOMIC NUMBERED ELEMENTS **c72**

H. Richard Ross *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 330-339 (For primary document see N93-22149 08-99)

Avail: CASI HC A02/MF A04

A non-destructive x-ray scatter (XRS) approach has been developed, along with a rapid atomic scatter algorithm for the detection and analysis of low atomic-numbered elements in solids, powders, and liquids. The present method of energy dispersive x-ray fluorescence spectroscopy (EDXRF) makes the analysis of light elements (i.e., less than sodium; less than 11) extremely difficult. Detection and measurement become progressively worse as atomic numbers become smaller, due to a competing process called 'Auger Emission', which reduces fluorescent intensity, coupled with the high mass absorption coefficients exhibited by low energy x-rays, the detection and determination of low atomic-numbered elements by x-ray spectrometry is limited. However, an indirect approach based on the intensity ratio of Compton and Rayleigh scattered has been used to define light element components in alloys, plastics and other materials. This XRS technique provides qualitative and quantitative information about the overall constituents of a variety of samples. Author

REACTIVE CONTROL AND REASONING ASSISTANCE FOR SCIENTIFIC LABORATORY INSTRUMENTS **c63**

David E. Thompson, Richard Levinson, and Peter Robinson *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 353-363 (For primary document see N93-22149 08-99)

Avail: CASI HC A03/MF A04

Scientific laboratory instruments that are involved in chemical or physical sample identification frequently require substantial human preparation, attention, and interactive control during their operation. Successful real-time analysis of incoming data that supports such interactive control requires: (1) a clear recognition of variance of the data from expected results; and (2) rapid diagnosis of possible alternative hypotheses which might explain the variance. Such analysis then aids in decisions about modifying the experiment protocol, as well as being a goal itself. This paper reports on a collaborative project at the NASA Ames Research Center between artificial intelligence researchers and planetary microbial ecologists. Our team is currently engaged in developing software that autonomously controls science laboratory instruments and that provides data analysis of the real-time data in support of dynamic refinement of the experiment control. the first two instruments to which this technology has been applied are a differential thermal analyzer (DTA) and a gas chromatograph (GC). coupled together, they form a new geochemicstry and microbial analysis tool that is capable of rapid identification of the organiz and mineralogical constituents in soils. The thermal decomposition of the minerals and organics, and the attendance release of evolved gases, provides data about the structural and molecular chemistry of the soil samples. Author

KNOWLEDGE FROM PICTURES (KFP) **c63**

Walt Truszkowski, Frank Paterra (Computer Technology Associates, Inc., Rockville, MD.), and Sidney Bailin (Computer Technology Associates, Inc., Rockville, MD.) *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 364-373 (For primary document see N93-22149 08-99)

Avail: CASI HC A02/MF A04

The old maxim goes: 'A picture is worth a thousand words'. The objective of the research reported in this paper is to demonstrate this idea as it relates to the knowledge acquisition process and the automated development of an expert system's rule base. A prototype tool, the Knowledge From Pictures (KFP) tool, has been developed which configures an expert system's rule base by an automated analysis of and reasoning about a 'picture', i.e., a graphical representation of some target system to be supported by the diagnostic capabilities of the expert system under development. This rule base, when refined, could then be used by the expert system for target system monitoring and fault analysis in an operational setting. Most people, when faced with the problem of understanding the behavior of a complicated system, resort to the use of some picture or graphical representation of the system as an aid in thinking about it. This depiction provides a means of helping the individual to visualize the bahavior and dynamics of the system under study. An analysis of the picture augmented with the individual's background information, allows the problem solver to codify knowledge about the system. This knowledge can, in turn, be used to develop computer programs to automatically monitor the system's performance. The approach taken is this research was to mimic this knowledge acquisition paradigm. A prototype tool was developed which provides the user: (1) a mechanism for graphically representing sample system-configurations appropriate for the domain, and (2) a linguistic device for annotating the graphical representation with the behaviors and mutual influences of the components depicted in the graphic. The KFP tool, reasoning from the graphical depiction along with user-supplied annotations of component behaviors and inter-component influences, generates a rule base that could be used in automating the fault detection, isolation, and repair of the system. (Grant NAG3-1027)

Avail: CASI HC A02/MF A04

Using an adaptation of NASA software, we have investigated the use of numerical optimization techniques for the shape and material optimization of fiber composite hip implants. The original NASA inhouse codes, were originally developed for the optimization of aerospace structures. The adapted code, which was called OPORIM, couples numerical optimization algorithms with finite element analysis and composite laminate theory to perform design optimization using both shape and material design variables. The external and internal geometry of the implant and the surrounding bone is described with quintic spline curves. This geometric representation is then used to create an equivalent 2-D finite element model of the structure. Using laminate theory and the 3-D geometric information, equivalent stiffnesses are generated for each element of the 2-D finite element model, so that the 3-D stiffness of the structure can be approximated. The geometric information to construct the model of the femur was obtained from a CT scan. A variety of test cases were examined, incorporating several implant constructions and design variable sets. Typically the code was able to produce optimized shape and/or material parameters which substantially reduced stress concentrations in the bone adjacent of the implant. The results indicate that this technology can provide meaningful insight into the design of fiber composite hip implants. Author

DESIGN OF A PORTABLE POWERED SEAT LIFT **c54**

Bruce Weddendorf *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 390-396 (For primary document see N93-22149 08-99)

Avail: CASI HC A02/MF A04

People suffering from degenerative hip or knee joints find sitting and rising from a seated position very difficult. These people can rely on large stationary chairs at home, but must ask others for assistance when rising from any other chair. An orthopedic surgeon identified to the MSFC

Technology Utilization Office the need for development of a portable device that could perform a similar function to the stationary lift chairs. The MSFC Structural Development Branch answered the Technology Utilization Office's request for design of a portable powered seat lift. The device is a seat cushion that opens under power, lifting the user to near-standing positions. The largest challenge was developing a mechanism to provide a stable lift over the large range of motion needed, and fold flat enough to be comfortable to sit on. CAD 3-D modeling was used to generate complete drawings for the prototype, and a full-scale working model of the Seat lift was made based on the drawings. The working model is of low strength, but proves the function of the mechanism and the concept. Author

MICROCOMPUTER BASED SOFTWARE FOR BIODYNAMIC SIMULATION **c54**
N. Rangarajan and T. Shams *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 397-405 (For primary document see N93-22149 08-99)
Avail: CASI HC A02/MF A04

This paper presents a description of a microcomputer based software package, called DYNAMAN, which has been developed to allow an analyst to simulate the dynamics of a system consisting of a number of mass segments linked by joints. One primary application is in predicting the motion of a human occupant in a vehicle under the influence of a variety of external forces, specially those generated during a crash event. Extensive use of a graphical user interface has been made to aid the user in setting up the input data for the simulation and in viewing the results from the simulation. Among its many applications, it has been successfully used in the prototype design of a moving seat that aids in occupant protection during a crash, by aircraft designers in evaluating occupant injury in airplane crashes, and by users in accident reconstruction for reconstructing the motion of the occupant and correlating the impacts with observed injuries. THE DATA EGG: A NEW SOLUTION TO TEXT ENTRY BARRIERS **c82**
Gary L. Friedman *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 409-418 (For primary document see N93-22149 08-99)
Avail: CASI HC A02/MF A04

A unit that allows text entry with only one hand has been developed, and holds the promise of allowing computers to be truly portable. It is unique in that it allows operation in any position, freeing the user from the traditional constraints of having to be seated near a desk. This hand held, chord-key-based unit can be used either autonomously for idea capturing, or tethered to a personal computer and used as an auxiliary keyboard. Astronauts, journalists, the bedridden, and anyone else normally barred from using a computer while on the job could also benefit from this form of man-machine interface, which has been dubbed the 'Data Egg'. MIRAGE: THE DATA ACQUISITION, ANALYSIS, AND DISPLAY SYSTEM **c82**
Robert S. Rosser and Hasan H. Rahman *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 419-428 (For primary document see N93-22149 08-99)
Avail: CASI HC A02/MF A04

Developed for the NASA Johnson Space Center and Life Sciences Directorate by GE Government Services, the Microcomputer Integrated Real-time Acquisition Ground Equipment (MIRAGE) system is a portable ground support system for Spacelab life sciences experiments. The MIRAGE system can acquire digital or analog data. Digital data may be NRZ-formatted telemetry packets of packets from a network interface. Analog signal are digitized and stored in experimental packet format. Data packets from any acquisition source are archived to a disk as they are received. Meta-parameters are generated from the data packet parameters by applying mathematical and logical operators. Parameters are displayed in text and graphical form or output to analog devices. Experiment data packets may be retransmitted through the network interface. Data stream definition, experiment parameter format, parameter displays, and other variables are configured using spreadsheet database. A database can be developed to support virtually any data packet format. The user interface provides menu- and icon-driven program control. The MIRAGE system can be integrated with other workstations to perform a variety of functions. The generic capabilities, adaptability and ease of use make the MIRAGE a cost-effective solution to many experimental data processing requirements. Author

Mayergoyz (Maryland Univ., College Park.) *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 429-438 (For primary document see N93-22149 08-99)
Avail: CASI HC A02/MF A04

We have developed a powerful new tool for studying the magnetic patterns on magnetic recording media. This was accomplished by modifying a conventional scanning tunneling microscope. The fine-wire probe that is used to image surface topography was replaced with a flexible magnetic probe. Images obtained with these probes reveal both the surface topography and the magnetic structure. We have made a thorough theoretical analysis of the interaction between the probe and the magnetic fields emanating from a typical recorded surface. Quantitative data about the constituent magnetic fields can then be obtained. We have employed these techniques in studies of two of the most important issues of magnetic record: data overwrite and maximizing data-density. These studies have shown: (1) overwritten data can be retrieved under certain conditions; and (2) improvements in data-density will require new magnetic materials. In the course of these studies we have developed new techniques to analyze magnetic fields of recorded media. These studies are both theoretical and experimental and combined with the use of our magnetic force scanning tunneling microscope should lead to further breakthroughs in the field of magnetic recording. OPERATOR PERFORMANCE SUPPORT SYSTEM (OPSS) **c54**
Marlen Z. Conklin (Nova Univ., Dania, FL.) *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 439-444 (For primary document see N93-22149 08-99)
Avail: CASI HC A02/MF A04

In the complex and fast reaction world of military operations, present technologies, combined with tactical situations, have flooded the operator with assorted information that he is expected to process instantly. As technologies progress, this flow of data and information have both guided and overwhelmed the operator. However, the technologies that have confounded many operators today can be used to assist him -- thus the Operator Performance Support Team. In this paper we propose an operator support station that incorporates the elements of Video and Image Databases, productivity Software, Interactive Computer Based Training, Hypertext/Hypermedia Databases, Expert Programs, and Human Factors Engineering. The Operator Performance Support System will provide the operator with an integrating on-line information/knowledge system that will guide expert or novice to correct systems operations. Although the OPSS is being developed for the Navy, the performance of the workforce in today's competitive industry is of major concern. The concepts presented in this paper which address ASW systems software design issues are also directly applicable to industry. the OPSS will propose practical applications in how to more closely align the relationships between technical knowledge and equipment operator performance. A NEW TECHNOLOGY FOR MANUFACTURING SCHEDULING DERIVED FROM SPACE SYSTEM OPERATIONS **c31**
R. S. Hornstein and J. K. Willoughby (Avyx, Inc., Englewood, CO.) *In its* Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 447-453 (For primary document see N93-22149 08-99)
Avail: CASI HC A02/MF A04

A new technology for producing finite capacity schedules has been developed in response to complex requirements for operating space systems such as the Space Shuttle, the Space Station, and the Deep Space Network for telecommunications. This technology has proven its effectiveness in manufacturing environments where popular scheduling techniques associated with Materials Resources Planning (MRPII) and with factory simulation are not adequate for shop-floor work planning and control. The technology has three components. The first is a set of data structures that accommodate an extremely general description of a factory's resources, its manufacturing activities, and the constraints imposed by the environment. The second component is a language and set of software utilities that enable a rapid synthesis of functional capabilities. The third component is an algorithmic architecture called the Five Ruleset Model which accommodates the unique needs of each factory. Using the new technology, systems can model activities that generate, consume, and/or obligate resources. This allows work-in-process (WIP) to be generated and used; it permits constraints to be imposed or intermediate as well as finished goods inventories. It is also possible to match as closely as possible both the current factory state and future conditions such as promise dates. Schedule revisions can be accommodated without impacting the entire production schedule. Applications have been successful in both discrete and process manufacturing environments. The availability of a high-quality finite capacity production planning capability enhances the data management capabilities of MRP II systems. These schedules can be integrated with shop-floor data collection systems and accounting systems. Using the new technology, semi-custom systems can be developed at costs that are comparable to products that do not have equivalent functional capabilities and/or extensibility. Author

THREE-DIMENSIONAL LASER WINDOW FORMATION FOR INDUSTRIAL APPLICATION **c36**

Vincent G. Verhoff and David Kowalski *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 454-459 (For primary document see N93-22149 08-99)

Avail: CASI HC A04/MF A04

The NASA Lewis Research Center has developed and implemented a unique process for forming flawless three-dimensional, compound-curvature laser windows to extreme accuracies. These windows represent an integral component of specialized nonintrusive laser data acquisition systems that are used in a variety of compressor and turbine research testing facilities. These windows are molded to the flow surface profile of turbine and compressor casings and are required to withstand extremely high pressures and temperatures. This method of glass formation could also be used to form compound-curvature mirrors that would require little polishing and for a variety of industrial applications, including research view ports for testing devices and view ports for factory machines with compound-curvature casings. Currently, sodium-alumino-silicate glass is recommended for three-dimensional laser windows because of its high strength due to chemical strengthening and its optical clarity. This paper discusses the main aspects of three-dimensional laser window formation. It focuses on the unique methodology and the peculiarities that are associated with the formation of these windows. HIGH PERFORMANCE SAPPHIRE WINDOWS **c36**

Stephen C. Bates (Advanced Fuel Research, Inc., East Hartford, CT.) and Larry Liou *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 460-469 (For primary document see N93-22149 08-99)

Avail: CASI HC A02/MF A04

High-quality, wide-aperture optical access is usually required for the advanced laser diagnostics that can now make a wide variety of non-intrusive measurements of combustion processes. Specially processed and mounted sapphire windows are proposed to provide this optical access to extreme environment. Through surface treatments and proper thermal stress design, single crystal sapphire can be a mechanically equivalent replacement for high strength steel. A prototype sapphire window and mounting system have been developed in a successful NASA SBIR Phase 1 project. A large and reliable increase in sapphire design strength (as much as 10x) has been achieved, and the initial specifications necessary for these gains have been defined. Failure testing of small windows has conclusively demonstrated the increased sapphire strength, indicating that a nearly flawless surface polish is the primary cause of strengthening, while an unusual mounting arrangement also significantly contributes to a larger effective strength. Phase 2 work will complete specification and demonstration of these windows, and will fabricate a set for use at NASA. The enhanced capabilities of these high performance sapphire windows will lead to many diagnostic capabilities not previously possible, as well as new applications for sapphire. Author

A DUAL OUTPUT PRESSURE, HIGH RELIABILITY, LONG STORAGE LIFE GAS DELIVERY VESSEL ASSEMBLY **c37**

Isaac Maya, Joe McKee, and Rajiv Rajpurkar *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 470-474 (For primary document see N93-22149 08-99)

Avail: CASI HC A01/MF A04

A Gas Vessel Assembly has been developed that delivers purified, very low moisture content gas at two different output pressures. High pressure gas is delivered at up to 6,700 psi, and low pressure gas regulated to 130 psi is also delivered via a second outlet over a wide range of flow rates. The device is extremely lightweight (less than 1 lb) and compact, affords maximum mechanical integrity, high reliability (0.9999 at 95 percent confidence level), and offers extremely long storage life. Specialized design and fabrication techniques are employed that guarantee gas purity and negligible leakage for more than 20 years, in widely varying conditions of storage temperature, humidity, altitude, and vibration environments. The technology offers unique advantages in fast, high pressure discharge applications. For example, when combined with a cryostat, cryogenic temperatures can be achieved such as those used in missile seeker technology. The technology has many additional applications such as: emergency power sources for safety devices such as those needed in nuclear power plants, refineries, collision cushioning devices, superconductor cooling devices, emergency egress systems, miniature mechanical devices that employ gas bearings, and other areas where long storage, extremely high reliability and/or high energy density sources are required. ON-LINE PROCESS ANALYSIS INNOVATION: DICOMP (TM) SHUNTING DIELECTRIC SENSOR TECHNOLOGY **c33**

Craig R. Davis and Frank A. Waldman *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 477-484 (For primary document see N93-22149 08-99)

Avail: CASI HC A02/MF A04

The DiComp Shunting Dielectric Sensor (SDS) is a new patent-pending technology developed under the Small Business Innovation Research Program (SBIR) for NASA's Kennedy Space Center. The incorporation of a shunt electrode into a conventional fringing field dielectric sensor makes the SDS uniquely sensitive to changes in material dielectric properties in the KHz to MHz range which were previously detectable only at GHz measurement frequencies. The initial NASA application of the SDS for Nutrient Delivery Control has demonstrated SDS capabilities for thickness and concentration measurement of Hoagland nutrient solutions. The commercial introduction of DiComp SDS technology for concentration and percent solids measurements in dispersions, emulsions and solutions represents a new technology for process measurements for liquids in a variety of industries. A MODULAR, PROGRAMMABLE MEASUREMENT SYSTEM FOR PHYSIOLOGICAL AND SPACEFLIGHT APPLICATIONS **c35**

John W. Hines, Robert D. Ricks (Sverdrup Technology, Inc., Moffett Field, CA.), and Christopher J. Miles (Sverdrup Technology, Inc., Moffett Field, CA.) *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 485-493 (For primary document see N93-22149 08-99)

Avail: CASI HC A02/MF A04

The NASA-Ames Sensors 2000! Program has developed a small, compact, modular, programmable, sensor signal conditioning and measurement system, initially targeted for Life Sciences Spaceflight Programs. The system consists of a twelve-slot, multi-layer, distributed function backplane, a digital microcontroller/memory subsystem, conditioned and isolated power supplies, and six application-specific, physiological signal conditioners. Each signal condition is capable of being programmed for gains, offsets, calibration and operate modes, and, in some cases, selectable outputs and functional modes. Presently, the system has the capability for measuring ECG, EMG, EEG, Temperature, Respiration, Pressure, Force, and Acceleration parameters, in physiological ranges. The measurement system makes heavy use of surface-mount packaging technology, resulting in plug in modules sized 125x55 mm. The complete 12-slot system is contained within a volume of 220x150x70mm. The system's capabilities extend well beyond the specific objectives of NASA programs. Indeed, the potential commercial uses of the technology are virtually limitless. In addition to applications in medical and biomedical sensing, the system might also be used in process control situations, in clinical or research environments, in general instrumentation systems, factory processing, or any other applications where high quality measurements are required. PREDICTIVE SENSOR METHOD AND APPARATUS **c35**
Vivien J. Cambridge and Thomas L. Koger *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 494-500 (For primary document see N93-22149 08-99)
Avail: CASI HC A02/MF A04

A microprocessor and electronics package employing predictive methodology was developed to accelerate the response time of slowly responding hydrogen sensors. The system developed improved sensor response time from approximately 90 seconds to 8.5 seconds. The microprocessor works in real-time providing accurate hydrogen concentration corrected for fluctuations in sensor output resulting from changes in atmospheric pressure and temperature. Following the successful development of the hydrogen sensor system, the system and predictive methodology was adapted to a commercial medical thermometer probe. Results of the experiment indicate that, with some customization of hardware and software, response time improvements are possible for medical thermometers as well as other slowly responding sensors. ATTIRE (ANALYTICAL TOOLS FOR THERMAL INFRARED ENGINEERING): A SENSOR SIMULATION AND MODELING PACKAGE **c35**
S. Jaggi *In* NASA, Washington, Technology 2002: The Third National Technology Transfer Conference and Exposition, Volume 2 Feb. 1993 p 501-519 (For primary document see N93-22149 08-99)
Avail: CASI HC A03/MF A04

The Advanced Sensor Development Laboratory (ASDL) at the Stennis Space Center develops, maintains and calibrates remote sensing instruments for the National Aeronautics & Space Administration (NASA). To perform system design trade-offs, analysis, and establish system parameters, ASDL has developed a software package for analytical simulation of sensor systems. This package called 'Analytical Tools for Thermal InfraRed Engineering' - ATTIRE, simulates the various components of a sensor system. The software allows each subsystem of the sensor to be analyzed independently for its performance. These performance parameters are then integrated to obtain system level information such as Signal-to-Noise Ratio (SNR), Noise Equivalent Radiance (NER), Noise Equivalent Temperature Difference (NETD) etc. This paper describes the uses of the package and the physics that were used to derive the performance parameters. CAPSULE REVIEW OF DOE RESEARCH AND DEVELOPMENT LABORATORIES AND FIELD FACILITIES
Sep. 1992 140 p
(DE93-003282; DOE/ST-0002P) Avail: CASI HC A07/MF A02

An overview of the unique complex of research, technical development, manufacturing, and administrative facilities that comprise the US Department of Energy (DOE) field installations is provided. Originating in the Manhattan Project of World War 2, the DOE field facilities system has developed in several major directions. It includes the largest uranium enrichment and special nuclear materials production complex in the free world; its manufacturing facilities provide the nuclear devices for the national strategic defense system; and it develops the nuclear reactors that power the submarine fleet of the US Navy. Equally important is the growth of the scientific and technological capabilities of the system. The original concentration on nuclear physics has been broadened to encompass the entire spectrum of the fundamental sciences. Research in DOE laboratories now spans investigations into the nature of matter and chemical reactions, cosmology, the operation of biological cells, the process of genetic information coding, the ecosystem, the geosphere, mathematics and computing, and medicine. Nearly every area of basic scientific knowledge is represented in the research activities of the laboratories within the DOE field system. The 9 multiprogram laboratories and 21 program-dedicated laboratories accomplish the fundamental scientific work of the DOE field system and also the bulk of the research and development. DOE

The Institute for Information Technology (IIT) of Canada's National Research Council has the mission of assisting Canadian industry in achieving excellence in information technology software and systems by promoting, supporting, and undertaking focused, industry-oriented research and development programs in those areas. There are four elements to IIT's research program: software engineering, knowledge-based systems, sensor-based automation, and systems integration. Research is conducted in four Ottawa laboratories (one for each element) and one laboratory in Vancouver which focuses on systems integration for the resource industries. Research programs and activities for 1991-1992 are summarized in such areas as photonic systems (fiber optics, optically enhanced computing), sensor systems (digital imaging and machine vision), sensor-based robotics (including supervised autonomy or man-machine cooperation), the Intelligent Advisor Project, diagnostic systems, machine learning, realtime and embedded software systems, software portability and design recovery, industrial and manufacturing systems, electromagnetic protection, and support systems for the resource and transportation industries. The Structures and Materials Laboratory (SML) is one of four laboratories of the Institute of Aerospace Research of Canada's National Research Council. The SML is concerned with research and development on matters affecting the structural design, strength, stability, durability, and structural integrity of aircraft, engines, and space structures. After an overview of the organizational structure of the SML and its interactions with external organizations, a synopsis is provided of each of the research projects that were active in the SML during 1990 and 1991. Reports and publications resulting from each of the projects are listed, and illustrations and figures are included for some of the projects. Projects are described under the following programs: aerospace structures, structural dynamics and acoustics; aerospace materials and engineering physics; and structures facilities, services and administration. Author (CISTI)

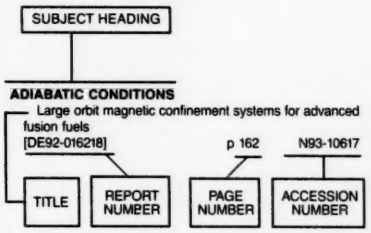
Typical Subject Index Listing



The subject heading is a key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension has been added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The page number helps you locate the the citation in the abstract section. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus*.

[DE93-003700] p 2513 N93-24496

ABSORPTION SPECTROSCOPY
Laser-induced breakdown spectroscopy for remote elemental analysis of planetary surfaces
[DE93-003865] p 2553 N93-22949
X ray absorption fine structure strain determination in thin films p 2326 N93-23072
Studies of cosmic dusts using synchrotron radiation
p 2549 N93-23390
X ray absorption spectroscopy of dense, shock compressed, laser plasma p 2496 N93-23497

ABSORPTIVITY
Optical properties of slags: Data for refractive indices and absorption coefficients
[NPL-DMM(A)-73] p 2486 N93-22453

ABSTRACTS
COSMIC software catalog, 1993
[NASA-CR-191005] p 2434 N93-22205
ARTI refrigerant database
[DE93-006431] p 2239 N93-23949

AC GENERATORS
Dynamic analysis of Free-Piston Stirling Engine/Linear Alternator-load system-experimentally validated
[NASA-TM-106034] p 2473 N93-22559
Heat pipe heat transport system for the Stirling Space Power Converter (SSPC)
[NASA-CR-191065] p 2203 N93-22662
Modelling a single phase voltage controlled rectifier using Laplace transforms
[NASA-TM-106005] p 2474 N93-23016
Combined magnetic vector-scalar potential finite element computation of 3D magnetic field and performance of modified Lundell alternators in Space Station applications
[NASA-CR-192348] p 2263 N93-23215

ACCELERATED LIFE TESTS
Life cycle testing of desiccant core samples
[PB93-127058] p 2220 N93-23098
Step stress testing of receiver/transmitter units, part 1
[AD-A260182] p 2273 N93-24318

ACCELERATION
Preliminary OARE absolute acceleration measurements on STS-50
[NASA-TM-107724] p 2182 N93-22587

ACCELERATORS
Electron-beam rocket acceleration of hydrogen pellets
[DE93-002822] p 2171 N93-23685

ACCELEROMETERS
Preliminary OARE absolute acceleration measurements on STS-50
[NASA-TM-107724] p 2182 N93-22587
Silicon accelerometer for AHRS and hybrid navigation systems p 2120 N93-22786
Proposed ground-based control of accelerometer on Space Station Freedom
[NASA-TM-105960] p 2201 N93-23738

ACCEPTABILITY
Technical management and test procedures for AustroMir-1991 p 2158 N93-24357

ACCESS CONTROL
Universal channel network, or combining the best of token ring and slotted ring
[MEMO-INF-92-41] p 2449 N93-24630

ACCRETION DISKS
The stability of thick, self-gravitating disks in protostellar systems p 2551 N93-24185

ACCUMULATORS
A summary of recent activities at the National Solar Thermal Test Facility
[DE92-040969] p 2379 N93-22967

ACCURACY
Comparison of mapping with different satellite images
p 2348 N93-23540
Influence due to satellite attitude jitter on estimation of Digital Elevation Model (DEM) p 2350 N93-23551

ACID RAIN
Analysis of acid precipitation samples collected by state agencies
[PB93-144152] p 2386 N93-23276
The 111th Meeting for Research of Safety Engineering
[DE93-753679] p 2388 N93-24046

ACOUSTIC COUPLING
Well-posedness of a model for structural acoustic coupling in a cavity enclosed by a thin cylindrical shell
[NASA-CR-191439] p 2473 N93-22878

ACOUSTIC EMISSION
Research in ultrasonic measurements at NIST: 1982-1992
[PB93-152064] p 2476 N93-23682
Acoustic emission of structural materials exposed to open flames
[PB93-138980] p 2477 N93-23951

ACOUSTIC EXCITATION
Observation of impulsive acoustic events and the excitation of solar oscillations
[AD-A259788] p 2557 N93-23454

ACOUSTIC IMPEDANCE
The acoustical impedance at the junction of non-coaxial cylindrical ducts
[MATHS-REPT-A-157] p 2477 N93-24123

ACOUSTIC LEVITATION
Motion measurement of acoustically levitated object
[NASA-CASE-NPO-18191-1-CU] p 2135 N93-24601

ACOUSTIC MEASUREMENT
Acoustic determination of dewpoints in natural gas mixtures and retrograde condensates
[PB93-142917] p 2221 N93-23274
Research in ultrasonic measurements at NIST: 1982-1992
[PB93-152064] p 2476 N93-23682
Acoustic emission of structural materials exposed to open flames
[PB93-138980] p 2477 N93-23951
Microtopography of manganese crusts
[PB93-120830] p 2398 N93-23996

ACOUSTIC PROPAGATION
Low altitude acoustic propagation analysis by use of a three-dimensional parabolic wave equation
[ONERA-P-1992-1] p 2477 N93-24190

ACOUSTIC SCATTERING
Solution of the Helmholtz-Poincare Wave Equation using the coupled boundary integral equations and optimal surface eigenfunctions
[DE93-005300] p 2470 N93-24038

ACOUSTIC VELOCITY
Using nonlinear acoustics for nondestructive materials characterization and evaluation
[DE93-004447] p 2321 N93-22727
Acoustic determination of dewpoints in natural gas mixtures and retrograde condensates
[PB93-142917] p 2221 N93-23274

ACOUSTICS
Role of acoustics in flame/vortex interactions
[NASA-CR-191429] p 2299 N93-24494

ACRYLONITRILES
Dielectric and dynamic mechanical properties of ATBN-containing thermosets
[DREA-CR-91-444] p 2239 N93-23725

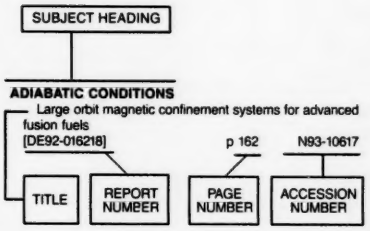
ACTINIDE SERIES
Isotope tracer studies of diffusion in silicates and of geological transport processes using actinide elements
[DE93-006902] p 2392 N93-23029

ACTIVATION
The influence of carbon dioxide on the catalytic oxidative coupling of methane over A-La2O3 and 2-La2O2CO3
[DE93-004800] p 2220 N93-22989

ACTIVATION ENERGY
The nucleation and growth of uranium on the basal plane of graphite studied by scanning tunneling microscopy
[DE93-006279] p 2501 N93-22510
Luminescence and picosecond photo-induced absorption of polyaniline
[AD-A260002] p 2242 N93-24436

ACTIVE CONTROL
Autonomous prealignment of a docking mechanism
p 2137 N93-22238
Precursor SSF utilization: The MODE experiments
p 2188 N93-22633

Typical Subject Index Listing



The subject heading is a key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension has been added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The page number helps you locate the the citation in the abstract section. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus*.

A

ABLATION
Ablation, melting, and smoothing of polycrystalline alumina by pulsed excimer laser radiation
[DE93-005148] p 2227 N93-22496
Atmospheric transmission of polar meteorites
[ESA-TT-1283] p 2547 N93-23206

ABLATIVE MATERIALS
Thermal protection systems for aerobrakes
p 2176 N93-22110

ABNORMALITIES
Occurrence Reporting and Processing System (ORPS) lessons learned: Tools to improve workplace performance
[DE93-005241] p 2522 N93-22498

ABRASION RESISTANCE
Optical and scratch resistant properties of diamondlike carbon films deposited with single and dual ion beams
[NASA-TM-105943] p 2206 N93-22586

ABSORBENTS
Life cycle testing of desiccant core samples
[PB93-127058] p 2220 N93-23098
High performance nanocomposite desiccation materials
[PB93-127025] p 2223 N93-24210

ABSORPTION CROSS SECTIONS
Multiple molecular scattering and albedo action on the solar spectral irradiance in the region of the UVB (less than or equal to 320 nm): A preliminary inventory
[AERONOMICA-ACTA-A-363-1991]
p 2558 N93-24637

ABSORPTION SPECTRA
Sputter-deposition and characterization of molybdenum disulfide thin films
[DE93-004801] p 2235 N93-22048
Spectroscopy and kinetics of combustion gases at high temperatures
[DE93-006892] p 2221 N93-23340
Compositional superlattices based on PtCl/PtBr MX materials
[DE93-003700] p 2513 N93-24496

ABSORPTION SPECTROSCOPY
Laser-induced breakdown spectroscopy for remote elemental analysis of planetary surfaces
[DE93-003865] p 2553 N93-22949
X ray absorption fine structure strain determination in thin films p 2326 N93-23072
Studies of cosmic dusts using synchrotron radiation
p 2549 N93-23390
X ray absorption spectroscopy of dense, shock compressed, laser plasma p 2496 N93-23497

ABSORPTIVITY
Optical properties of slags: Data for refractive indices and absorption coefficients
[NPL-DMM(A)-73] p 2486 N93-22453

ABSTRACTS
COSMIC software catalog, 1993
[NASA-CR-191005] p 2434 N93-22205
ARTI refrigerant database
[DE93-006431] p 2239 N93-23949

AC GENERATORS
Dynamic analysis of Free-Piston Stirling Engine/Linear Alternator-load system-experimentally validated
[NASA-TM-106034] p 2473 N93-22559
Heat pipe heat transport system for the Stirling Space Power Converter (SSPC)
[NASA-CR-191065] p 2203 N93-22662
Modelling a single phase voltage controlled rectifier using Laplace transforms
[NASA-TM-106005] p 2474 N93-23016
Combined magnetic vector-scalar potential finite element computation of 3D magnetic field and performance of modified Lundell alternators in Space Station applications
[NASA-CR-192348] p 2263 N93-23215

ACCELERATED LIFE TESTS
Life cycle testing of desiccant core samples
[PB93-127058] p 2220 N93-23098
Step stress testing of receiver/transmitter units, part 1
[AD-A260182] p 2273 N93-24318

ACCELERATION
Preliminary OARE absolute acceleration measurements on STS-50
[NASA-TM-107724] p 2182 N93-22587

ACCELERATORS
Electron-beam rocket acceleration of hydrogen pellets
[DE93-002822] p 2171 N93-23685

ACCELEROMETERS
Preliminary OARE absolute acceleration measurements on STS-50
[NASA-TM-107724] p 2182 N93-22587
Silicon accelerometer for AHRS and hybrid navigation systems p 2120 N93-22786
Proposed ground-based control of accelerometer on Space Station Freedom
[NASA-TM-105960] p 2201 N93-23738

ACCEPTABILITY
Technical management and test procedures for AustroMir-1991 p 2158 N93-24357

ACCESS CONTROL
Universal channel network, or combining the best of token ring and slotted ring
[MEMO-INF-92-41] p 2449 N93-24630

ACCRETION DISKS
The stability of thick, self-gravitating disks in protostellar systems p 2551 N93-24185

ACCUMULATORS
A summary of recent activities at the National Solar Thermal Test Facility
[DE92-040969] p 2379 N93-22967

ACCURACY
Comparison of mapping with different satellite images
p 2348 N93-23540
Influence due to satellite attitude jitter on estimation of Digital Elevation Model (DEM) p 2350 N93-23551

ACID RAIN
Analysis of acid precipitation samples collected by state agencies
[PB93-144152] p 2386 N93-23276
The 111th Meeting for Research of Safety Engineering
[DE93-753679] p 2388 N93-24046

ACOUSTIC COUPLING
Well-posedness of a model for structural acoustic coupling in a cavity enclosed by a thin cylindrical shell
[NASA-CR-191439] p 2473 N93-22878

ACOUSTIC EMISSION
Research in ultrasonic measurements at NIST: 1982-1992
[PB93-152064] p 2476 N93-23682
Acoustic emission of structural materials exposed to open flames
[PB93-138980] p 2477 N93-23951

ACOUSTIC EXCITATION
Observation of impulsive acoustic events and the excitation of solar oscillations
[AD-A259788] p 2557 N93-23454

ACOUSTIC IMPEDANCE
The acoustical impedance at the junction of non-coaxial cylindrical ducts
[MATHS-REPT-A-157] p 2477 N93-24123

ACOUSTIC LEVITATION
Motion measurement of acoustically levitated object
[NASA-CASE-NPO-18191-1-CU] p 2135 N93-24601

ACOUSTIC MEASUREMENT
Acoustic determination of dewpoints in natural gas mixtures and retrograde condensates
[PB93-142917] p 2221 N93-23274
Research in ultrasonic measurements at NIST: 1982-1992
[PB93-152064] p 2476 N93-23682
Acoustic emission of structural materials exposed to open flames
[PB93-138980] p 2477 N93-23951
Microtopography of manganese crusts
[PB93-120830] p 2398 N93-23996

ACOUSTIC PROPAGATION
Low altitude acoustic propagation analysis by use of a three-dimensional parabolic wave equation
[ONERA-P-1992-1] p 2477 N93-24190

ACOUSTIC SCATTERING
Solution of the Helmholtz-Poincare Wave Equation using the coupled boundary integral equations and optimal surface eigenfunctions
[DE93-005300] p 2470 N93-24038

ACOUSTIC VELOCITY
Using nonlinear acoustics for nondestructive materials characterization and evaluation
[DE93-004447] p 2321 N93-22727
Acoustic determination of dewpoints in natural gas mixtures and retrograde condensates
[PB93-142917] p 2221 N93-23274

ACOUSTICS
Role of acoustics in flame/vortex interactions
[NASA-CR-191429] p 2299 N93-24494

ACRYLONITRILES
Dielectric and dynamic mechanical properties of ATBN-containing thermosets
[DREA-CR-91-444] p 2239 N93-23725

ACTINIDE SERIES
Isotope tracer studies of diffusion in silicates and of geological transport processes using actinide elements
[DE93-006902] p 2392 N93-23029

ACTIVATION
The influence of carbon dioxide on the catalytic oxidative coupling of methane over A-La2O3 and 2-La2O2CO3
[DE93-004800] p 2220 N93-22989

ACTIVATION ENERGY
The nucleation and growth of uranium on the basal plane of graphite studied by scanning tunneling microscopy
[DE93-006279] p 2501 N93-22510
Luminescence and picosecond photo-induced absorption of polyaniline
[AD-A260002] p 2242 N93-24436

ACTIVE CONTROL
Autonomous prealignment of a docking mechanism
p 2137 N93-22238
Precursor SSF utilization: The MODE experiments
p 2188 N93-22633

Attenuation of empennage buffet response through active control of damping using piezoelectric material
[NASA-TM-107736] p 2110 N93-23034
Semi-active suspension for automotive application
[MEMT-17] p 2316 N93-23377
Vibration control experiments on a 12-meter cantilever truss structure
[AD-A259764] p 2328 N93-23484
Active control of the separation region on a two-dimensional airfoil p 2112 N93-23589
Perception/action: An holistic approach
[AD-A259597] p 2428 N93-24067
Analytical and experimental studies of a short compact subsonic diffuser for a two-dimensional supersonic inlet
[NASA-TP-3247] p 2113 N93-24118
Control of two- and three-dimensional wake instabilities from bluff-bodies
[AD-A260410] p 2299 N93-24428

ACTIVE GALACTIC NUCLEI
Active galactic nuclei: The view from space p 2534 N93-23886
ROSAT observations of active galactic nuclei p 2534 N93-23888
Very high energy gamma ray astrophysics
[DE93-007625] p 2551 N93-24453

ACTIVE GALAXIES
ROSAT all sky survey observations of IRAS galaxies
[MPE-PREPRINT-220] p 2542 N93-22462

ACTS
Analysis of MMIC arrays for use in the ACTS Aero Experiment
[NASA-TM-106073] p 2180 N93-22589
Advanced communications technology satellite high burst rate link evaluation terminal communication protocol software user's guide, version 1.0
[NASA-CR-189162] p 2437 N93-23134

ACTUATORS
Well-posedness of a model for structural acoustic coupling in a cavity enclosed by a thin cylindrical shell
[NASA-CR-191439] p 2473 N93-22878
The three-dimensional evolution of a plane mixing layer. Part 2: Pairing and transition to turbulence
[NASA-TM-103926] p 2294 N93-23417
Nonlinear adaptive control of electro-mechanical systems p 2461 N93-23716
Actuator stroke requirements based on a Zernike decomposition of atmospheric turbulence
[DE93-007393] p 2516 N93-24449
Microelectronic and micromechanical sensors and actuators in CMOS technology: A novel scheme toward s regularization and integration
[ISBN-0-315-60192-2] p 2305 N93-24609

ADA (PROGRAMMING LANGUAGE)
Update of GRASP/Ada reverse engineering tools for Ada
[NASA-CR-192465] p 2436 N93-22798

ADAPTATION
Spatial adaptation procedures on tetrahedral meshes for unsteady aerodynamic flow calculations
[NASA-TM-107726] p 2108 N93-22552
Eye-head-arm coordination and spinal reflexes in weightlessness p 2159 N93-24362

ADAPTIVE CONTROL
Adaptive fuzzy system for 3-D vision p 2451 N93-22216
Fuzzy logic path planning system for collision avoidance by an autonomous rover vehicle p 2451 N93-22217
Adaptive meshing in solids
[DE93-003238] p 2287 N93-22331
Advanced telerobotic control using neural networks p 2455 N93-22364
Adaptive process control using fuzzy logic and genetic algorithms p 2457 N93-22376
The ASLOTS concept: An interactive, adaptive decision support concept for Final Approach Spacing of Aircraft (FASA). FAA-NASA Joint University Program p 2105 N93-22563
Adaptive control of a flexible manipulator p 2458 N93-23201
Topics in stochastic systems, failure time models change-point problems, and sequential analysis
[AD-A260047] p 2472 N93-23711
Nonlinear adaptive control of electro-mechanical systems p 2461 N93-23716
Joint services electronics program. Basic research in electronics (JSEP)
[AD-A259598] p 2283 N93-24068
Modeling and control of flexible manipulators p 2318 N93-24182
Adaptive control of uncertain systems
[ISBN-0-315-54485-6] p 2464 N93-24622

ADAPTIVE FILTERS
Adaptive filters for monitoring localized brain activity from surface potential time series
[DE93-003795] p 2420 N93-22774

ADAPTIVE OPTICS
Prototyping of two-beam laser interferometer for measurement of optical turbulence along extended paths
[AD-A260229] p 2310 N93-24320

ADDITIVES
Local vibronic and electronic excitations of doping-induced states in the copper oxides
[DE93-003844] p 2501 N93-22429
Methane oxidation over dual redox catalysts
[DE92-012454] p 2217 N93-22431
Use of new oxygenates as gasoline components
[DE93-752864] p 2244 N93-22968
Electrical characterization of conducting polymers and polymeric semiconductor devices
[ACTA-POL-SCAND-PH-178] p 2238 N93-23006
Biofuels program plan, FY 1992 - 1996
[DE93-000036] p 2245 N93-23048
1991 CRC octane number requirement survey
[AD-A259821] p 2245 N93-23667
Broadband erbium-doped fiber sources for the fiber-optic gyroscope p 2304 N93-23723

ADDUCTS
Combustion-related studies using weakly-bonded complexes
[DE93-005250] p 2217 N93-22415
Electron conducting adducts of water-soluble redox polyelectrolytes and enzymes
[AD-A259938] p 2241 N93-24154
Gas source molecular beam epitaxial growth of GaN
[AD-A260524] p 2512 N93-24199

ADHESION
Atomic scale stitching of beryllium coatings to carbon substrates using 200-keV carbon ions
[DE93-007392] p 2485 N93-24565

ADHESION TESTS
Mesomechanical model for fibre composites: The role of the interface
[AD-A260195] p 2215 N93-24468

ADHESIVE BONDING
Rust transformation/rust compatible primers p 2244 N93-22182
A new method of impact tension testing of adhesively-bonded joints p 2212 N93-23939
A fracture mechanics approach to failure load predictions of structural adhesive joints p 2212 N93-23940
Designing for damage tolerant composite repairs
[AD-A260094] p 2214 N93-24053

ADIABATIC EQUATIONS
Chaotic dynamics in accelerator physics
[DE93-004600] p 2515 N93-22766

ADSORPTION
High pressure heterogeneous catalysis in a low pressure ultrahigh vacuum environment
[DE93-005917] p 2479 N93-22418
Correlations between surface structure and catalytic activity/selectivity
[DE93-005884] p 2217 N93-22423
Investigation of the kinetics of surface-limited thin film growth of SiGe alloys
[DE93-005419] p 2502 N93-22538
Adsorption kinetics at liquid-liquid interfaces in microgravity conditions. Experimental approach and theoretical background p 2248 N93-22843
Chemistry of bimetallic and alloy surfaces
[DE93-006893] p 2230 N93-22981
Sequential deposition of copper on solid gold (111): A statistical model
[AD-A260269] p 2234 N93-24233
Phase transitions at the fluid-solid interface in a model for the adsorption of hard spheres
[AD-A260304] p 2223 N93-24235
Effect of triplet correlations on the adsorption of a dense fluid onto a crystalline surface
[AD-A260306] p 2223 N93-24236
A model for voltammograms of the under-potential deposition of copper on solid gold (111) in the presence of bisulfate
[AD-A260309] p 2234 N93-24237
Solid-state (31)P magic angle spinning (MAS) NMR study of the partitioning and reaction of organophosphorus esters adsorbed on synthetic resin catalysts
[AD-A259889] p 2242 N93-24321

ADVANCED LAUNCH SYSTEM (STS)
Base heating methodology improvements, volume 1
[NASA-CR-192455] p 2202 N93-22350
User's manual for the ALS base heating prediction code, volume 2
[NASA-CR-192457] p 2203 N93-22962
Preliminary base heating environments for a generalized ALS LO2/LH2 launch vehicle, appendix 1 and 2
[NASA-CR-192456] p 2203 N93-22963

ADVANCED VERY HIGH RESOLUTION RADIOMETER
Observation in the East China Sea p 2335 N93-22126
Estimation of partial cloud cover within a pixel p 2335 N93-22127
Vegetation index for Europe p 2340 N93-22443
Distinguishing ice thickness from sea ice surface shape by using NOAA-AVHRR (National Oceanic and Atmosphere Administration Advanced Very High Resolution Radiometer) and SAR data p 2340 N93-22445
Investigations into the dynamics of sea ice in the East Greenland Sea region in May 1988, using NOAA-AVHRR data p 2341 N93-22446
NOAA participation in ISY Earth science and other activities p 2366 N93-23805

ADVECTION
Renormalization group estimates of transport coefficients in the advection of a passive scalar by incompressible turbulence
[NASA-CR-191421] p 2295 N93-23421
On regional surface fluxes over partly forested areas
[MPIM-82] p 2397 N93-23858

AERIAL PHOTOGRAPHY
Remote sensing and land use in the region of Tuscany (Italy). A new methodology for the integration of very heterogeneous data p 2353 N93-23567
Applicability of satellite remote sensing for slope instability hazard zonation p 2368 N93-23817

AEROACOUSTICS
Aeroacoustic diffraction and dissipation by a short propeller cowl in subsonic flight
[NASA-CR-190801] p 2476 N93-22673
Annual progress report, 1990-1991
[CTN-93-60695] p 2570 N93-23115
A multiple scales approach to sound generation by vibrating bodies
[NASA-CR-191414] p 2294 N93-23409

AEROASSIST
Flexible thermal protection materials for entry systems p 2177 N93-22111
Thermal protection materials at NASA Ames Research Center p 2177 N93-22114
Investigation of aerothermodynamics and optical radiation in the AFE hypersonic flow field
[NASA-CR-192844] p 2114 N93-24475

AEROBRAKING
Mars transfer vehicle studies p 2173 N93-22088
Aerobraking technology studies p 2173 N93-22089
Nuclear concepts/propulsion p 2174 N93-22093
Thermal protection systems for aerobrakes p 2176 N93-22110
Some materials perspectives for space transportation systems p 2177 N93-22115
Space transfer concepts and analysis for exploration missions. Implementation plan and element description document (draft final). Volume 2: Cryo/aerobrake vehicle
[NASA-CR-192490] p 2179 N93-23251
Investigation of aerothermodynamics and optical radiation in the AFE hypersonic flow field
[NASA-CR-192844] p 2114 N93-24475

AERODYNAMIC BALANCE
SUMS experiment flight results on STS-35
[NASA-TM-107738] p 2201 N93-23407

AERODYNAMIC CHARACTERISTICS
Full vector (3-D) inflow simulation in natural and wind farm environments using an expanded version of the SNLWIND (Veers) turbulence code
[DE93-000041] p 2376 N93-22334
An approximate method for estimating the lifting characteristics of thin bodies of non-circular cross-section
[CRANFIELD-AERO-9006] p 2108 N93-22395
Subsonic aerodynamic characteristics of a proposed advanced manned launch system orbiter configuration
[NASA-TM-4439] p 2108 N93-22558
Selected OAST/OSSA space experiment activities in support of Space Station Freedom p 2189 N93-22636
Aerodynamic sensitivity analysis in the transonic regime p 2109 N93-22667
An experimental study of the aerodynamics of a NACA0012 airfoil with a simulated glaze ice accretion, volume 2
[NASA-CR-191007] p 2109 N93-22823
A two-dimensional spoiler of arbitrary chordwise position in a low speed flow p 2127 N93-24211
Aerodynamic characteristics of a proposed Personnel Launch System (PLS) lifting-body configuration at Mach numbers from 0.05 to 20.3
[NASA-TM-101641] p 2180 N93-24522

AERODYNAMIC CONFIGURATIONS
A system for the numerical simulation of complex configuration internal aerodynamic fields for the aerospace industry
[ETN-93-93698] p 2110 N93-23364
A two-dimensional spoiler of arbitrary chordwise position in a low speed flow p 2127 N93-24211
Separated flow past smooth slender bodies p 2298 N93-24213

A method for the analysis of complex configuration three dimensional internal vortices based on the solution of Euler equations
[ETN-93-93701] p 2299 N93-24487
AERODYNAMIC FORCES
Preliminary OARE absolute acceleration measurements on STS-50
[NASA-TM-107724] p 2182 N93-22587
AERODYNAMIC HEAT TRANSFER
Wake-induced unsteady stagnation region heat transfer measurements p 2295 N93-23591
AERODYNAMIC HEATING
Base heating methodology improvements, volume 1
[NASA-CR-192455] p 2202 N93-22350
SUMS experiment flight results on STS-35
[NASA-TM-107738] p 2201 N93-23407
An overview of aeroelasticity studies for the National Aerospace Plane
[NASA-TM-107728] p 2111 N93-23422
Static and aerothermal tests of a superalloy honeycomb prepackaged thermal protection system
[NASA-TP-3257] p 2297 N93-24096
AERODYNAMIC INTERFERENCE
Slotted-wall flow-field measurements in a transonic wind tunnel
[NASA-TM-4280] p 2113 N93-24111
AERODYNAMIC LOADS
Stress calculation for the Sandia 34-meter wind turbine using the local circulation method and turbulent wind
[DE93-004480] p 2375 N93-22045
Hypersonic three-dimensional nonequilibrium boundary-layer equations in generalized curvilinear coordinates
[NASA-CR-185677] p 2109 N93-22802
Computation of rotor aerodynamic loads in forward flight using a full-span free wake analysis
[NASA-CR-177611] p 2113 N93-24058
Low-speed wind tunnel study of the direct lift and direct side-force characteristics of a joined-wing airplane
[DE93-767971] p 2115 N93-24508
AERODYNAMIC STABILITY
Stability of elastically tailored rotor systems
[AD-A260550] p 2132 N93-24241
AERODYNAMIC STALLING
Active control of the separation region on a two-dimensional airfoil p 2112 N93-23589
Unsteady flow past a pitching airfoil at moderately high subsonic free stream Mach numbers
[AD-A260118] p 2113 N93-23714
An oscillating three-dimensional wing experiment: Compressibility, sweep, rate, waveform, and geometry effects on unsteady separation and dynamic stall
[AD-A260530] p 2114 N93-24224
AERODYNAMICS
Joint University Program for Air Transportation Research, 1991-1992
[NASA-CP-3193] p 2105 N93-22561
Mechanisms and enhancement of flame stabilization
[DE93-006467] p 2219 N93-22709
An experimental study of the aerodynamics of a NACA0012 airfoil with a simulated glaze ice accretion, volume 2
[NASA-CR-191007] p 2109 N93-22823
Concept definition study for an extremely large aerophysics/ range facility
[NASA-CR-4491] p 2133 N93-22987
Aeronautical engineering: A cumulative index to a continuing bibliography (supplement 287)
[NASA-SP-7037(287)] p 2107 N93-23038
Aeronautical engineering: A continuing bibliography with indexes (supplement 288)
[NASA-SP-7037(288)] p 2107 N93-23039
Annual progress report, 1990-1991
[CTN-93-60695] p 2570 N93-23115
Bank-to-turn missiles and autopilot design
[ETN-93-93488] p 2131 N93-23373
Performance and test section flow characteristics of the National Full-Scale Aerodynamics Complex 80- by 120-Foot Wind Tunnel
[NASA-TM-103920] p 2134 N93-23420
AEROELASTICITY
Wing flutter boundary prediction using an unsteady Euler aerodynamic method
[NASA-TM-107732] p 2108 N93-22457
An improved CAMRAD model for aeroelastic stability analysis of the XV-15 with advanced technology blades
[NASA-TM-4448] p 2125 N93-22486
Structural dynamics division research and technology accomplishments for FY 1992 and plans for FY 1993
[NASA-TM-107713] p 2109 N93-22671
Attenuation of empennage buffet response through active control of damping using piezoelectric material
[NASA-TM-107736] p 2110 N93-23034
Algorithm and code development for unsteady three-dimensional Navier-Stokes equations
[NASA-CR-192760] p 2292 N93-23234
An overview of aeroelasticity studies for the National Aerospace Plane
[NASA-TM-107728] p 2111 N93-23422
AERONAUTICAL ENGINEERING
The role of university research in aviation safety and competitiveness: Testimony to the US Congress
[NIAR-92-3] p 2116 N93-22379
Transportation technology program: Strategic plan
[NASA-TM-108706] p 2152 N93-23032
Aeronautical engineering: A cumulative index to a continuing bibliography (supplement 287)
[NASA-SP-7037(287)] p 2107 N93-23038
Aeronautical engineering: A continuing bibliography with indexes (supplement 288)
[NASA-SP-7037(288)] p 2107 N93-23039
AERONAUTICS
An evaluation of schedule metrics used within aeronautical systems center
[AD-A260113] p 2521 N93-24413
AEROSOLS
Elimination of absorption effect of atmospheric gases and stratospheric aerosol by combined use of IR and microwave data p 2335 N93-22128
Gas-Grain Simulation Facility (GGSF) p 2186 N93-22626
Aerosol phase transformation in the atmosphere
[DE93-001903] p 2384 N93-22936
Studies of the formation chemical reactivity and properties of small clusters application to an understanding of aerosol formation and heterogeneous chemistry
[DE93-005920] p 2221 N93-23309
Photoacoustic determination of the single-scattering albedo of carbonaceous particulates p 2395 N93-23493
Light extinction in the atmosphere
[DE93-005034] p 2397 N93-23978
Aerosol measurements at the South Pole during 1987
[PB93-137016] p 2390 N93-24567
AEROSPACE ENGINEERING
Space Transportation Materials and Structures Technology Workshop. Volume 2: Proceedings
[NASA-CP-3148-VOL-2] p 2172 N93-22081
CSTI Earth-to-orbit propulsion research and technology program overview p 2174 N93-22090
How to get on board Space Station Freedom p 2183 N93-22611
Space technology research plans p 2184 N93-22613
Space Station Freedom as an engineering experiment station: An overview p 2187 N93-22631
Precursor Space Station Freedom experiments p 2188 N93-22632
Utilization of Space Station Freedom for technology research p 2188 N93-22634
Selected OAST/OSSA space experiment activities in support of Space Station Freedom p 2189 N93-22636
Center for Space Microelectronics Technology
[NASA-CR-192799] p 2279 N93-22812
Transportation technology program: Strategic plan
[NASA-TM-108706] p 2152 N93-23032
JPRS report: Science and technology. Central Eurasia: Space
[JPRS-USP-93-001] p 2153 N93-23103
First National Space Grant Conference report
[NASA-EP-275] p 2516 N93-23140
Pre-college education p 2516 N93-23142
College education p 2516 N93-23143
Underrepresented groups p 2517 N93-23146
Pipeline issues p 2517 N93-23148
State and local governments p 2517 N93-23149
Focusing educational initiatives p 2517 N93-23150
University-industry interaction p 2517 N93-23151
Organization and management of space grant programs p 2517 N93-23152
Communications p 2517 N93-23153
Use of fellowships p 2517 N93-23154
Pitfalls p 2517 N93-23155
NASA's strategic plan for education. A strategy for change, 1993-1998
[NASA-EP-289] p 2517 N93-23174
Solving modal equations of motion with initial conditions using MSC/NASTRAN DMAP. Part 1: Implementing exact mode superposition
[NASA-TM-106063] p 2329 N93-23739
Solving modal equations of motion with initial conditions using MSC/NASTRAN DMAP. Part 2: Coupled versus uncoupled integration
[NASA-TM-106064] p 2330 N93-23740
Research activities and highlights of the University of Maryland's Department of Aerospace Engineering p 2571 N93-24478
AEROSPACE ENVIRONMENTS
Utilization of Space Station Freedom for technology research p 2188 N93-22634
Fluids in Space
[ESA-SP-353] p 2246 N93-22830
Flight project data book
[NASA-TM-108657] p 2152 N93-22870
Space activities and environmental protection: Role of the United Nations p 2372 N93-23841
Solar flares and magnetospheric particles: Investigations based upon the ONR-602 and ONR-604 experiments
[AD-A259781] p 2557 N93-23973
Ecosystems on Earth and in space (the possible utilization of artificial ecosystems for space life support systems) p 2167 N93-24406
AEROSPACE INDUSTRY
Risk management in fly-by-wire systems
[NASA-TM-104757] p 2180 N93-22703
Post Cold War assessment of US space policy: A task group report
[PB93-139962] p 2532 N93-22900
National security and national competitiveness: Open source solutions NASA requirements and capabilities
[NASA-TM-4458] p 2523 N93-23030
Transportation technology program: Strategic plan
[NASA-TM-108706] p 2152 N93-23032
First National Space Grant Conference report
[NASA-EP-275] p 2516 N93-23140
Outreach and public service p 2517 N93-23147
State and local governments p 2517 N93-23149
University-industry interaction p 2517 N93-23151
Communications p 2517 N93-23153
Industry perspectives p 2154 N93-23162
Human Factors Issues in Aircraft Maintenance and Inspection. Science, technology, and management: A program review
[PB93-146975] p 2427 N93-23647
An evaluation of schedule metrics used within aeronautical systems center
[AD-A260113] p 2521 N93-24413
Future of the US space industrial base: A task group report
[PB93-139954] p 2522 N93-24585
AEROSPACE MEDICINE
Space life sciences perspectives for Space Station Freedom p 2185 N93-22619
Life sciences utilization of Space Station Freedom p 2185 N93-22622
Life sciences recruitment objectives p 2186 N93-22623
Biomedical Monitoring and Countermeasures Facility p 2186 N93-22624
Crew health p 2187 N93-22630
Cytokines and immune surveillance in humans
[NASA-CR-192728] p 2447 N93-22828
Bibliography of the Biosciences Division: 1986 to present
[DCIEM-92-20] p 2419 N93-23343
Two techniques for measuring locomotion impact forces during zero G
[NASA-TP-3305] p 2421 N93-23410
Tobacco and health of the pilot
[ETN-93-93693] p 2421 N93-23414
Human Factors Issues in Aircraft Maintenance and Inspection. Science, technology, and management: A program review
[PB93-146975] p 2427 N93-23647
Survey of aviation medical examiners: Information and attitudes about the pre-employment and pre-appointment drug testing program
[DOT/FAA/AM-92/15] p 2422 N93-24088
Selection of astronauts for European space missions p 2156 N93-24345
Mir '92 project p 2157 N93-24350
Mir 1992: Scientific program and payload p 2157 N93-24351
Physiological experiments within the project AustroMir p 2157 N93-24354
Telescience testbedding for physiological experiments under hypobaric hypoxic conditions p 2165 N93-24398
An automated method for determining mass properties
[AD-A259924] p 2428 N93-24441
AEROSPACE PLANES
Materials and structures technologies for hypersonics p 2177 N93-22116
New launch technologies and American competitiveness p 2153 N93-23157
Saenger: A space transportation system for the 21st century
[ETN-93-93696] p 2126 N93-23363
Usage of small-sized aerospace plane in the infrastructure of space research of the Earth p 2362 N93-23781
The effect of missions and payload performance on the configuration of an orbital injection system design p 2156 N93-24349
AEROSPACE SAFETY
Control of a varying thrust spacecraft for autonomous space rendezvous p 2139 N93-22246

Space technology research plans p 2184 N93-22613
Space Station Furnace Facility. Volume 2: Requirements definition and conceptual design study. Appendix 3: Environment analysis
[NASA-CR-192475] p 2199 N93-23224

AEROSPACE SCIENCES
COSMIC software catalog, 1993
[NASA-CR-191005] p 2434 N93-22205
Transportation technology program: Strategic plan
[NASA-TM-108706] p 2152 N93-23032
JPRS report: Science and technology. Central Eurasia: Space

Organization and management of space grant programs p 2517 N93-23152
Communications p 2517 N93-23153
Use of fellowships p 2517 N93-23154
Pitfalls p 2517 N93-23155
The Eighth National Space Symposium
[ISBN-0-9616962-5-7] p 2153 N93-23156
NASA's strategic plan for education. A strategy for change, 1993-1998
[NASA-EP-289] p 2517 N93-23174
Annual bibliography, 1989
[ISBN-951-22-0488-6] p 2526 N93-23424
The role of planetariums in promoting space sciences p 2170 N93-23827
The tropical school for atmospheric and space sciences: An international project proposal p 2369 N93-23828
Innovation: Key to the future
[NASA-TM-103599] p 2571 N93-24095
NASA scientific and technical publications: A catalog of special publications, reference publications, conference publications, and technical papers, 1991-1992
[NASA-SP-7063(06)] p 2529 N93-24654

AEROSPACE SYSTEMS
Advances in automatic electro-optical tracking systems p 2254 N93-22020
Space assembled entry systems certification p 2176 N93-22106
Failure environment analysis tool applications p 2322 N93-22170
A new technology for manufacturing scheduling derived from space system operations p 2260 N93-22196
SSTAC/ARTS review of the draft Integrated Technology Plan (ITP). Volume 5: Human Support
[NASA-TM-108653] p 2518 N93-22465
Innovation: Key to the future
[NASA-TM-103599] p 2571 N93-24095

AEROSPACE TECHNOLOGY TRANSFER
Communications p 2517 N93-23153
Human Factors Issues in Aircraft Maintenance and Inspection. Science, technology, and management: A program review
[PB93-146975] p 2427 N93-23647

AEROSPACE VEHICLES
Entry systems technology assessment p 2177 N93-22118
Computer Aided Control System Design (CACSD) p 2107 N93-22572
X-ray computed tomography for advanced materials and processes
[AD-A259828] p 2213 N93-23953
Multiobjective optimization of aerospace structures
[AD-A260433] p 2127 N93-24430

AEROTHERMODYNAMICS
Orbiter lessons learned: A guide to future vehicle development p 2175 N93-22100
Entry systems technology assessment p 2177 N93-22118
Hypersonic three-dimensional nonequilibrium boundary-layer equations in generalized curvilinear coordinates
[NASA-CR-185677] p 2109 N93-22802
Preliminary base heating environments for a generalized ALS LO2/LH2 launch vehicle, appendix 1 and 2
[NASA-CR-192456] p 2203 N93-22963
Investigation of aerothermodynamics and optical radiation in the AFE hypersonic flow field
[NASA-CR-192844] p 2114 N93-24475
Instrumentation for hypersonic aerodynamics research with tethered satellites
[NASA-CR-191435] p 2442 N93-24539
Flowfield computer graphics
[NASA-CR-193029] p 2444 N93-24655

AFRICA
System design for ARTEMIS environmental monitoring p 2349 N93-23545
Analysis of human impact on degradation and desertification of the West African Sahel by means of multi-level remote sensing techniques p 2355 N93-23578

AGE FACTOR
A linear, time-varying simulation of the respiratory tract system
[DE93-004515] p 2421 N93-24009

AGGLOMERATION
Stardust: Studies in microgravity of condensation and agglomeration of cosmic dust analogue p 2164 N93-24394

AGGREGATES
Geogrid reinforced base courses for flexible pavements for light aircraft: Test section construction, behavior under traffic, laboratory tests, and design criteria
[DOT/FAA/RD-92/25] p 2134 N93-23128
Experimental and theoretical studies of reverse micelles in dense gases
[PB93-141901] p 2222 N93-24143

AGING (MATERIALS)
A study into the effects of electric fields and currents on the aging and quench hardening of steels
[AD-A260228] p 2233 N93-24098

AGRICULTURE
NRC Twin Otter operations in the 1991 California ozone deposition experiment
[NRC-LTR-FR-118] p 2383 N93-22472
Satellite navigation in agriculture p 2124 N93-23528
Image treatment and geographical information systems at the service of the Common Agricultural Policy p 2351 N93-23555
Application of remote sensing and GIS. Technology to natural resources management: Selecting rice fields in Vietnam p 2353 N93-23569
Action 4 from image to statistics: Operational review after two years of rapid estimates of acreages and potential yields of major annual crops throughout the European community p 2360 N93-23770
AGRICOLA subject category codes with scope notes (modified AGRIS)
[PB93-152643] p 2528 N93-24202
List of journals indexed in AGRICOLA, 1992
[PB93-152650] p 2528 N93-24204
Analysis and synthesis of models for effects of climate change on agricultural systems
[DE93-007949] p 2389 N93-24521

AIR CONDITIONING
Compatibility of refrigerants and lubricants with elastomers
[DE93-006429] p 2216 N93-22057
COP improvement of refrigerator/freezers, air-conditioners, and heat pumps using nonazeotropic refrigerant mixtures p 2259 N93-22166
Colorado State University program for developing, testing, evaluating and optimizing solar heating and cooling systems
[DE93-005795] p 2376 N93-22417
Compatibility of refrigerants and lubricants with elastomers
[DE93-007808] p 2237 N93-22729
Materials compatibility and lubricants research on CFC-refrigerant substitutes
[DE93-007806] p 2237 N93-22915
Heat pump technology: Responding to new opportunities
[DE93-005939] p 2379 N93-22978

AIR CONDITIONING EQUIPMENT
COP improvement of refrigerator/freezers, air-conditioners, and heat pumps using nonazeotropic refrigerant mixtures p 2259 N93-22166
Colorado State University program for developing, testing, evaluating and optimizing solar heating and cooling systems
[DE93-005795] p 2376 N93-22417

AIR DEFENSE
Electromagnetic radiating source elimination (ERASE) program p 2254 N93-22019
Versatile attack weapon p 2256 N93-22027
Detection of active emitters using triangulation and trilateration techniques: Theory and practice p 2267 N93-23612
Technical Digest. Detection systems and technology, September 1992
[AD-A259812] p 2271 N93-23670

AIR FLOW
Theoretical errors on airborne measurements of: Static pressure, impact temperature, air flow angle, air flow speed
[PB93-136406] p 2405 N93-23232
On regional surface fluxes over partly forested areas
[MPIM-82] p 2397 N93-23858

AIR LAND INTERACTIONS
Diagnostic determination of boundary-layer cumulus clouds using HAPEX aircraft data
[DE93-002164] p 2402 N93-22337
Calibration, navigation, and registration of MAMS data for FIFE
[NASA-CR-108397] p 2342 N93-22699

AIR LAUNCHING
A conceptual design analysis of an air launched anti-satellite missile system
[ETN-93-93487] p 2126 N93-23372

AIR NAVIGATION
Calibration, navigation, and registration of MAMS data for FIFE
[NASA-CR-108397] p 2342 N93-22699
Simulation evaluation of a low-altitude helicopter flight guidance system adapted for a helmet-mounted display
[NASA-TM-103883] p 2122 N93-23419
Precise flight navigation by integration of global positioning system and inertial measurement units p 2124 N93-23523
Towards global satellite navigation p 2124 N93-23529
On-line health monitoring: An integrity improvement for the civil use of GPS and GLONASS p 2125 N93-23535
An integrated Rotorcraft Avionics/Controls Architecture to support advanced controls and low-altitude guidance flight research
[NASA-TM-103983] p 2134 N93-24493

AIR POLLUTION
Evaluation of resistively heated fuel injection technology to reduce cold start emissions and assist starting/driveaway of a methanol-fueled vehicle
[PB93-144350] p 2313 N93-22901
Development of size-specific data from particulate control technology research reports
[PB93-131456] p 2384 N93-22922
Proceedings of the Fourth Annual Fuel Cells Contractors Review Meeting
[DE92-001290] p 2378 N93-22934
Formation and control of combustion pollutants from gasoline-fueled spark-ignition motor vehicle engines
[PB93-141042] p 2314 N93-23275
Survey of data from the continuous sites of the 1990 Atlanta ozone precursor study
[PB93-124618] p 2386 N93-23348
Scenario development for the northeast United States 500 millibar height field p 2408 N93-23968
The 111th Meeting for Research of Safety Engineering
[DE93-753679] p 2388 N93-24046
Guidelines for estimating and applying rule effectiveness for ozone CO state implementation plan base year inventories
[PB93-131498] p 2389 N93-24163
NOAA/CMDL atmospheric methane data from shipboard flask sampling
[PB93-136489] p 2389 N93-24226
Enabling document for regulations governing compliance extensions for early reductions of hazardous air pollutants
[PB93-147007] p 2390 N93-24584
Simulation of the formation and transport of ozone in the atmospheric boundary layer
[ESA-TT-1243] p 2402 N93-24615

AIR PURIFICATION
Zero-G life support for Space Station Freedom p 2189 N93-22640
Integrated oxygen recovery system
[NASA-CR-192343] p 2426 N93-22663

AIR QUALITY
NRC Twin Otter operations in the 1991 California ozone deposition experiment
[NRC-LTR-FR-118] p 2383 N93-22472
Development of size-specific data from particulate control technology research reports
[PB93-131456] p 2384 N93-22922
Survey of data from the continuous sites of the 1990 Atlanta ozone precursor study
[PB93-124618] p 2386 N93-23348
Numerical simulations of the transport and diffusion during the 1991 Winter Validation Study along the front range in Colorado
[DE93-002684] p 2396 N93-23674
Development and application of procedures to evaluate air quality and visibility impacts of low-altitude flying operations
[AD-A259903] p 2408 N93-23990
Guidelines for estimating and applying rule effectiveness for ozone CO state implementation plan base year inventories
[PB93-131498] p 2389 N93-24163

AIR SAMPLING
A gas extraction system for the measurement of carbon dioxide and carbon isotopes in polar ice cores
[DE93-005289] p 2412 N93-22225
Isotope identification of purified xenon and krypton by low-background gamma spectroscopy
[DE93-004585] p 2217 N93-22339
AIR SEA ICE INTERACTIONS
Climate variability in a coupled GCM. Part 1: The tropical pacific
[MPIM-73] p 2407 N93-23633
On the space-time structure of ENSO
[MPIM-74] p 2407 N93-23634
Iron fertilization of the austral ocean: A model assessment
[MPIM-84] p 2415 N93-23860
AIR TO AIR MISSILES
A conceptual design analysis of an air launched anti-satellite missile system
[ETN-93-93487] p 2126 N93-23372
AIR TO SURFACE MISSILES
Versatile attack weapon p 2256 N93-22027
X ray computed tomography for whole system evaluation (small engines)
[AD-A259519] p 2130 N93-23669
AIR TRAFFIC
Advanced air traffic management
p 2107 N93-22571
A method for estimating future runway capacity of German airports for single runway systems
[DLR-FB-91-38] p 2132 N93-22666
Multipath runway exits and taxiways
[DOT/FAA/CT-92/19] p 2134 N93-23217
TCAS 2: Report on UK operational trial
[CAA-PAPER-92011] p 2122 N93-24105
AIR TRAFFIC CONTROL
Terrain Referenced Information and Guidance Systems (TRIGS)
[MBB-FE-315-S-PUB-0494] p 2119 N93-22390
Hazard evaluation and operational cockpit display of ground-measured windshear data
[AIAA PAPER 90-0566] p 2105 N93-22564
Advanced air traffic management
p 2107 N93-22571
A method for estimating future runway capacity of German airports for single runway systems
[DLR-FB-91-38] p 2132 N93-22666
Air traffic operational evaluation plan of the automated surface observing system (ASOS) displays
[DOT/FAA/CT-TN92/36] p 2121 N93-22801
Operational evaluation of the converging runway display aid at Saint Louis
[MTR-92W0000217] p 2133 N93-22874
Plan for the evaluation of the prototype Terminal Doppler Weather Radar (TDWR) system
[DOT/FAA/CT-TN92/44] p 2404 N93-23045
Controller evaluation of initial terminal data link ATC services: Mini study 3
[DOT/FAA/CT-92/18] p 2262 N93-23046
Multipath runway exits and taxiways
[DOT/FAA/CT-92/19] p 2134 N93-23217
Airline applications in air-/ground communication using advanced technologies p 2275 N93-23514
The future role of satellite communications in an improved air traffic management p 2275 N93-23518
TCAS 2: Report on UK operational trial
[CAA-PAPER-92011] p 2122 N93-24105
AIR TRAFFIC CONTROLLERS (PERSONNEL)
Air traffic operational evaluation plan of the automated surface observing system (ASOS) displays
[DOT/FAA/CT-TN92/36] p 2121 N93-22801
Stress resistance as a diagnostic category in air traffic controller selection
[DLR-FB-92-13] p 2422 N93-24092
AIR TRANSPORTATION
Joint University Program for Air Transportation Research, 1991-1992
[NASA-CP-3193] p 2105 N93-22561
An investigation of air transportation technology at the Massachusetts Institute of Technology, 1991-1992
p 2105 N93-22562
Hazard alerting and situational awareness in advanced air transport cockpits p 2106 N93-22566
Investigation of air transportation technology at Princeton University, 1991-1992 p 2106 N93-22570
Options of air traffic distribution in the Berlin region (Germany)
[DLR-FB-91-37] p 2117 N93-22660
AIR WATER INTERACTIONS
Physical oceanography of the US Atlantic and Eastern Gulf of Mexico
[PB93-123909] p 2412 N93-22067
Nested Grid Model performance during cold offshore and warm onshore flow over the Gulf of Mexico
[PB93-108090] p 2404 N93-23090
The effect of current-induced stress perturbation on large- and meso-scale air-sea interactions
p 2393 N93-23207
Direct numerical simulations and hydrodynamic stability problems in the upper oceanic mixed layer
p 2414 N93-23490
A hybrid coupled tropical atmosphere ocean model: Sensitivities and hindcast skill
[MPIM-76] p 2396 N93-23635
The joint normal modes of the coupled atmosphere-ocean system observed from 1967 to 1986
[MPIM-78] p 2396 N93-23637
On the cold start problem in transient simulations with coupled atmosphere-ocean models
[MPIM-83] p 2397 N93-23859
Airborne studies of ocean-particle-cloud interactions
[AD-A259874] p 2415 N93-23958
Modeling the tropical ocean response to westerly wind forcing
[AD-A260230] p 2416 N93-24099
Application of ocean models for the interpretation of AGCM experiments on the climate of the last glacial maximum
[MPIM-80] p 2416 N93-24581
AIRBORNE EQUIPMENT
Theoretical errors on airborne measurements of: Static pressure, impact temperature, air flow angle, air flow speed
[PB93-136406] p 2405 N93-23232
Airborne system for detection and location of radio interference sources p 2269 N93-23622
Size dependence of the chemical properties of cloud droplets: Exploratory studies by aircraft
[PB93-136117] p 2410 N93-24501
AIRBORNE/SPACEBORNE COMPUTERS
Automated target recognition and tracking using an optical pattern recognition neural network
p 2138 N93-22240
Onboard navigation rendezvous expert system
p 2144 N93-22280
DataMir: A PC-based computer system for application at Space Station Mir p 2158 N93-24358
Data compression opportunities in EOSDIS
p 2430 N93-24545
AIRCRAFT
Bogie-gripping transfer device
[CA-PATENT-APPL-SN-024586] p 2135 N93-24643
Wheeled transfer device for moving an aircraft
[CA-PATENT-APPL-SN-2-024584] p 2135 N93-24644
AIRCRAFT ACCIDENT INVESTIGATION
Aircraft accident report: Air Transport International, Inc., flight 805, Douglas DC-8-63, N794AL. Loss of control and crash, Swanton, Ohio, 15 February 1992
[PB92-910406] p 2117 N93-23086
AIRCRAFT ACCIDENTS
Optimal recovery from microburst wind shear
p 2107 N93-22574
Aircraft accident report: Air Transport International, Inc., flight 805, Douglas DC-8-63, N794AL. Loss of control and crash, Swanton, Ohio, 15 February 1992
[PB92-910406] p 2117 N93-23086
Safety study: Alcohol and other drug involvement in fatal general aviation accidents, 1983 through 1988
[PB92-917008] p 2117 N93-23187
Aircraft accident report: United Airlines flight 585, Boeing 737-291, N999UA, uncontrolled collision with terrain for undetermined reasons, 4 miles south of Colorado Springs Municipal Airport, Colorado Springs, Colorado, 3 March 1991
[PB92-910407] p 2117 N93-23191
Modeling the heat release rate of aircraft cabin panels
[DOT/FAA/CT-92/3] p 2118 N93-23222
The annual probability of an aircraft crash on the US Department of Energy reservation in Oak Ridge, Tennessee
[DE93-005171] p 2118 N93-23325
The consequence of joint failures
p 2212 N93-23941
AIRCRAFT APPROACH SPACING
An investigation of air transportation technology at the Massachusetts Institute of Technology, 1991-1992
p 2105 N93-22562
The ASLOTS concept: An interactive, adaptive decision support concept for Final Approach Spacing of Aircraft (FASA). FAA-NASA Joint University Program
p 2105 N93-22563
AIRCRAFT BRAKES
Soft-ground arresting system for commercial aircraft
[DOT/FAA/CT-TN93/4] p 2133 N93-22797
AIRCRAFT COMMUNICATION
OSI applied to aeronautical satellite mobile communications in EURATN p 2276 N93-23525
AIRCRAFT COMPARTMENTS
Modeling the heat release rate of aircraft cabin panels
[DOT/FAA/CT-92/3] p 2118 N93-23222
AIRCRAFT CONFIGURATIONS
Theoretical errors on airborne measurements of: Static pressure, impact temperature, air flow angle, air flow speed
[PB93-136406] p 2405 N93-23232
Analysis of a high speed civil transport configuration at subsonic flow conditions using a Navier-Stokes solver
[NASA-CR-4490] p 2127 N93-24108
AIRCRAFT CONSTRUCTION MATERIALS
Practical problems related to flammability and combustion in space p 2226 N93-22839
NASA-UVA Light Aerospace Alloy and Structures Technology Program: LA(2)ST
[NASA-CR-192354] p 2230 N93-23193
Review of aeronautical fatigue investigation activities developed in Aeritalia-GAT during the period May 1987 - April 1989
[ETN-93-93702] p 2126 N93-23401
Non-chromated surface pretreatments for aluminum
[AD-A260130] p 2232 N93-23704
Airframe materials
[ISBN-0-919086-32-2] p 2211 N93-23935
Fiber-metal laminates: A solution to weight, strength, and fatigue problems p 2211 N93-23938
Automated manufacturing of continuous fibre composite structures for aerospace applications
p 2212 N93-23942
A review of design and manufacturing methodologies for stiffened composite panels used in aircraft
p 2128 N93-23943
Research projects
[NRC-LTR-ST-1883] p 2571 N93-24652
AIRCRAFT CONTROL
Linear payout systems for dispensing fiber-optic data links from precision-guided munitions or high-performance aircraft/missles p 2255 N93-22026
A neural based intelligent flight control system for the NASA F-15 flight research aircraft p 2132 N93-22368
An improved CAMRAD model for aeroelastic stability analysis of the XV-15 with advanced technology blades
[NASA-TM-4448] p 2125 N93-22486
Dynamic response and control of a jet-transport aircraft encountering a single-axis vortex p 2107 N93-22575
Trail maneuver generation and selection in the Paladin tactical decision generation system
[NASA-TM-107722] p 2131 N93-23088
A simulation of the Boeing B-747 aircraft
[CRANFIELD-AERO-9202] p 2127 N93-24074
AIRCRAFT DESIGN
Automatic differentiation of advancod CFD codes for multidisciplinary design
[DE93-005685] p 2290 N93-22867
MD-11: When appearances deceive
[ETN-93-93695] p 2126 N93-23416
CFD-based approximation concepts for aerodynamic design optimization with application to a 2-D scramjet vehicle p 2126 N93-23505
The role of fatigue testing in the design, development, and certification of the ATR 42/72
[ETN-93-93704] p 2127 N93-23969
Scientific visualization of volumetric radar cross section data
[AD-A259586] p 2272 N93-24065
Multiobjective optimization of aerospace structures
[AD-A260433] p 2127 N93-24430
Use of system identification techniques for improving airframe finite element models using test data
[NASA-CR-192699] p 2128 N93-24481
Microwave-powered aircraft
[CA-PATENT-1-295-019] p 2128 N93-24591
AIRCRAFT DETECTION
Detectability of high power aircraft
[MBB-FE-S-PUB-0490] p 2262 N93-22682
AIRCRAFT ENGINES
Report to the Chairman, Subcommittee on Defense, Committee on Appropriations, House of Representatives. Intelligence programs: New RC-135 aircraft engines can reduce cost and improve performance
[AD-A259283] p 2105 N93-22397
Summary of the effects of engine throttle response on airplane formation-flying qualities
[NASA-TM-4465] p 2131 N93-23123
Aircraft engine reliability analysis using lower confidence limit estimate procedures
[AD-A260386] p 2131 N93-24271
AIRCRAFT EQUIPMENT
An expert system for the diagnostic and maintenance of various aircraft components
[MBB-FE-363-S-PUB-0499] p 2105 N93-22392
Ground proximity warning system for use with aircraft having degraded performance
[CA-PATENT-1-295-716] p 2118 N93-24200
AIRCRAFT FUELS
Mini-satellite exploration of very near Earth space fuel objects
[DE93-005253] p 2195 N93-24057

Combustion and heat transfer studies utilizing advanced diagnostics: Fuels research
[AD-A260249] p 2246 N93-24332

AIRCRAFT GUIDANCE
Terrain Referenced Information and Guidance Systems (TRIGS)
[MBB-FE-315-S-PUB-0494] p 2119 N93-22390
Joint University Program for Air Transportation Research, 1991-1992
[NASA-CP-3193] p 2105 N93-22561
GPS multipath errors in the precision landing environment p 2106 N93-22569
Operational evaluation of the converging runway display aid at Saint Louis
[MTR-92W0000217] p 2133 N93-22874

AIRCRAFT HAZARDS
Modeling the heat release rate of aircraft cabin panels
[DOT/FAA/CT-92/3] p 2118 N93-23222

AIRCRAFT ICING
Icing cloud simulator for use in helicopter engine induction system ice protection testing
[DOT/FAA/CT-TN92/43] p 2133 N93-23087

AIRCRAFT INSTRUMENTS
Flight experience with lightweight, low-power miniaturized instrumentation systems
[NASA-TM-4463] p 2128 N93-23102

AIRCRAFT LANDING
Optimization of flight trajectories in a 3D model of windshear flow field p 2110 N93-23203
Low-speed wind tunnel study of the direct lift and direct side-force characteristics of a joined-wing airplane
[DE93-767971] p 2115 N93-24508

AIRCRAFT MAINTENANCE
An artificial intelligence-based structural health monitoring system for aging aircraft
p 2465 N93-22185
An expert system for the diagnostic and maintenance of various aircraft components
[MBB-FE-363-S-PUB-0499] p 2105 N93-22392
Condition based machinery maintenance (helicopter fault detection), phase 1
[AD-A259774] p 2316 N93-23477
Human Factors Issues in Aircraft Maintenance and Inspection. Science, technology, and management: A program review
[PB93-146975] p 2427 N93-23647
Comparative evaluation of a monocular head mounted display device versus a flat screen display device in presenting aircraft maintenance technical data
[AD-A259684] p 2427 N93-23660
Non-chromated surface pretreatments for aluminum
[AD-A260130] p 2232 N93-23704

AIRCRAFT MANEUVERS
Trail maneuver generation and selection in the Paladin tactical decision generation system
[NASA-TM-107722] p 2131 N93-23088

AIRCRAFT MODELS
Flight experience with lightweight, low-power miniaturized instrumentation systems
[NASA-TM-4463] p 2128 N93-23102
Low-speed wind tunnel study of the direct lift and direct side-force characteristics of a joined-wing airplane
[DE93-767971] p 2115 N93-24508
Inflow measurements made with a laser velocimeter on a helicopter model in forward flight. Volume 8: Rectangular planform blades at an advance ratio of 0.23, 0.50 chord above the tip path plane
[NASA-TM-102642] p 2115 N93-24524
Inflow measurements made with a laser velocimeter on a helicopter model in forward flight. Volume 9: Rectangular planform blades at an advance ratio of 0.23, 0.75 chord above the tip path plane
[NASA-TM-102643] p 2115 N93-24525
Inflow measurements made with a laser velocimeter on a helicopter model in forward flight. Volume 11: Rectangular planform blades at an advance ratio of 0.30, 0.75 chord above the tip path plane
[NASA-TM-102645] p 2115 N93-24527
Inflow measurements made with a laser velocimeter on a helicopter model in forward flight. Volume 10: Rectangular planform blades at an advance ratio of 0.30, 0.50 chord above the tip path plane
[NASA-TM-102644] p 2116 N93-24528
Inflow measurements made with a laser velocimeter on a helicopter model in forward flight. Volume 7: Rectangular planform blades at an advance ratio of 0.40
[NASA-TM-101599] p 2116 N93-24538
Inflow measurements made with a laser velocimeter on a helicopter model in forward flight. Volume 6: Rectangular planform blades at an advance ratio of 0.35
[NASA-TM-101598] p 2116 N93-24540

AIRCRAFT NOISE
Feasibility study on conducting overflight measurements of shaped sonic boom signatures using the Firebee BQM-34E RPV
[NASA-CR-189715] p 2476 N93-22813
Tiltrotor aircraft noise: A summary of the presentations and discussions at the 1991 FAA/Georgia Tech Workshop
[AD-A260072] p 2477 N93-24119
Aircraft overflight study: Effect of aircraft altitude upon sound levels at the ground
[PB93-144194] p 2477 N93-24572

AIRCRAFT PERFORMANCE
Detectability of high power aircraft
[MBB-FE-S-PUB-0490] p 2262 N93-22682
Simulation evaluation of a low-altitude helicopter flight guidance system adapted for a helmet-mounted display
[NASA-TM-103883] p 2122 N93-23419

AIRCRAFT PILOTS
In-flight field-of-view with ANVIS
[AD-A259905] p 2427 N93-23992
Effects on physiology and performance of wearing the aviator NBC ensemble while flying the UH-60 helicopter flight simulator in a controlled heat environment
[AD-A259909] p 2427 N93-23995
The five-factor personality model and naval aviation candidates
[AD-A260227] p 2425 N93-24319
Human visual limitations on suprathreshold contrast perception through ANVIS
[AD-A259970] p 2425 N93-24431

AIRCRAFT SAFETY
An artificial intelligence-based structural health monitoring system for aging aircraft
p 2465 N93-22185
The role of university research in aviation safety and competitiveness: Testimony to the US Congress
[NIAR-92-3] p 2116 N93-22379
Solar-powered light emitting diode power line avoidance marker design
[AD-A259886] p 2381 N93-23983
Ground proximity warning system for use with aircraft having degraded performance
[CA-PATENT-1-295-716] p 2118 N93-24200
Aircraft fire protection system
[CA-PATENT-1-296-970] p 2118 N93-24592

AIRCRAFT STRUCTURES
Computer aided integrated production planning in unit production, as represented in aircraft construction
[MBB-FW-3-S-PUB-0439-A] p 2435 N93-22394
Modeling the heat release rate of aircraft cabin panels
[DOT/FAA/CT-92/3] p 2118 N93-23222
Review of aeronautical fatigue investigation activities developed in Aeritalia-GAT during the period May 1987 - April 1989
[ETN-93-93702] p 2126 N93-23401
X-ray computed tomography for advanced materials and processes
[AD-A259828] p 2213 N93-23953
Multiobjective optimization of aerospace structures
[AD-A260433] p 2127 N93-24430
Research projects
[NRC-LTR-ST-1883] p 2571 N93-24652

AIRDROPS
A nonlinear dynamic spherical membrane model
[AD-A259633] p 2112 N93-23654

AIRFOILS
Swept wing attachment line contamination fence
[NASA-CASE-LAR-13400-1] p 2107 N93-22015
Navier-Stokes analysis of airfoils with leading edge ice accretions
[NASA-CR-191008] p 2109 N93-22822
An experimental study of the aerodynamics of a NACA0012 airfoil with a simulated glaze ice accretion, volume 2
[NASA-CR-191007] p 2109 N93-22823
Active control of the separation region on a two-dimensional airfoil p 2112 N93-23589
Unsteady flow past a pitching airfoil at moderately high subsonic free stream Mach numbers
[AD-A260118] p 2113 N93-23714
Low-speed wind tunnel study of the direct lift and direct side-force characteristics of a joined-wing airplane
[DE93-767971] p 2115 N93-24508
Induced inflow velocity and blade surface pressure measurements for a helicopter model in forward flight. Volume 1: Advance ratio of 0.37, thrust coefficient of 0.0081, and hover tip speed of 710 ft/sec
[NASA-TM-104224] p 2116 N93-24532

AIRFRAMES
An overview of aeroelasticity studies for the National Aerospace Plane
[NASA-TM-107728] p 2111 N93-23422
Tip-vortex/airframe interactions p 2111 N93-23489
Use of system identification techniques for improving airframe finite element models using test data
[NASA-CR-192699] p 2128 N93-24481

AIRLINE OPERATIONS
An artificial intelligence-based structural health monitoring system for aging aircraft
p 2465 N93-22185
Options of air traffic distribution in the Berlin region (Germany)
[DLR-FB-91-37] p 2117 N93-22660
Activities report of Lufthansa German Airlines
[ETN-93-93465] p 2117 N93-23004
Aircraft accident report: United Airlines flight 585, Boeing 737-291, N999UA, uncontrolled collision with terrain for undetermined reasons, 4 miles south of Colorado Springs Municipal Airport, Colorado Springs, Colorado, 3 March 1991
[PB92-910407] p 2117 N93-23191
Airline applications in air-/ground communication using advanced technologies p 2275 N93-23514
Human Factors Issues in Aircraft Maintenance and Inspection. Science, technology, and management: A program review
[PB93-146975] p 2427 N93-23647
Aircraft overflight study recommended plan: Detailed sampling, data collection and data analysis plans for the visitor survey and the dose-response survey
[PB93-144186] p 2478 N93-24649

AIRPORT PLANNING
Options of air traffic distribution in the Berlin region (Germany)
[DLR-FB-91-37] p 2117 N93-22660

AIRPORTS
Options of air traffic distribution in the Berlin region (Germany)
[DLR-FB-91-37] p 2117 N93-22660
A method for estimating future runway capacity of German airports for single runway systems
[DLR-FB-91-38] p 2132 N93-22666
Plan for the evaluation of the prototype Terminal Doppler Weather Radar (TDWR) system
[DOT/FAA/CT-TN92/44] p 2404 N93-23045
An assessment of permafrost conditions at three DND airports in Arctic Canada as they pertain to future planning and operations
[ORAE-R107] p 2133 N93-23114
Multipath runway exits and taxiways
[DOT/FAA/CT-92/19] p 2134 N93-23217

ALABAMA
Small business profiles, 1992. Region 4: Alabama, Florida, Georgia, Kentucky, Mississippi, North Carolina, South Carolina, and Tennessee
[PB93-110955] p 2519 N93-23286

ALASKA
Environmental data sets at the University of Alaska
p 2338 N93-22146
Small business profiles, 1992. Region 10: Alaska, Idaho, Oregon, and Washington
[PB93-111011] p 2521 N93-24305

ALBEDO
The influence of the hydrologic cycle on the extent of sea ice with climatic implications
[NASA-CR-192772] p 2413 N93-22700
Photoacoustic determination of the single-scattering albedo of carbonaceous particulates
p 2395 N93-23493
Precipitating auroral electron flux characteristics based on UV data obtained by the AIRS experiment onboard the polar BEAR satellite
[AD-A260015] p 2401 N93-24301

ALCOHOLS
High octane ethers from synthesis gas-derived alcohols
[DE93-006476] p 2245 N93-24031
Design of a high activity and selectivity alcohol catalyst
[DE93-008100] p 2225 N93-24575

ALGEBRA
The design of scalable software libraries for distributed memory concurrent computers
[DE93-003612] p 2434 N93-22332
Robust algebraic image enhancement for intelligent control systems p 2454 N93-22361
Aprepro: An algebraic preprocessor for parameterizing finite element analyses
[DE93-006989] p 2466 N93-22527
An algebra of discrete event processes
[NASA-TM-102848] p 2469 N93-23413
Data for map algebra p 2350 N93-23553

ALGORITHMS
Multi-window registration algorithm for automatic detection and tracking of moving targets
p 2255 N93-22022
Inverting sets and the packing problem
[DE93-003822] p 2466 N93-22075
An investigative study of multispectral data compression for remotely-sensed images using vector quantization and difference-mapped shift-coding p 2445 N93-22157
Constraint checking during error recovery
p 2445 N93-22169
Methods for predicting properties and tailoring salt solutions for industrial processes p 2226 N93-22183

A fuzzy logic controller for an autonomous mobile robot p 2452 N93-22220
A synthetic environment for visualization and planning of orbital maneuvers p 2140 N93-22251
Image based tracking approaches to AR/C at the Johnson Space Center p 2140 N93-22256
Automated rendezvous and proximity operations p 2141 N93-22257
LADAR vision technology for automated rendezvous and capture p 2141 N93-22258
Use of non-spherical gravity harmonics for relative motion GN/C (category 2) p 2141 N93-22262
GN/C translation and rotation control parameters for AR/C (category 2) p 2142 N93-22263
New developments in astrodynamics algorithms for autonomous rendezvous p 2144 N93-22279
Solution to a multicriteria aircraft routing problem utilizing parallel search techniques
[AD-A259293] p 2119 N93-22398
Copper Mountain conference on iterative methods, volume 2
[DE93-004994] p 2466 N93-22405
Theories of elastoplasticity coupled with continuum damage mechanics
[DE93-007426] p 2323 N93-22534
Flight evaluation of differential GPS aided inertial navigation systems p 2120 N93-22790
Toward achieving global sole means radionavigation systems p 2121 N93-22794
Automatic differentiation of advanced CFD codes for multidisciplinary design
[DE93-005685] p 2290 N93-22867
GJOIN: A program for merging two or more GENESIS databases
[DE93-007709] p 2523 N93-22914
Applications and accuracy of the parallel diagonal dominant algorithm
[NASA-CR-191431] p 2438 N93-23173
Implementation of a Monte Carlo algorithm for neutron transport on a massively parallel SIMD machine
[DE93-005461] p 2447 N93-23245
Effectiveness of feature and classifier algorithms in character recognition systems
[PB93-147197] p 2525 N93-23272
A stochastic learning algorithm for layered neural networks
[DE93-003555] p 2458 N93-23288
Bipartitioning of LOTOS specifications
[MEMO-INF-92-50] p 2439 N93-23359
A comparison of polynomial and rational NARMAX models for nonlinear system identification
[RR-444] p 2469 N93-23374
Identification of systems from non-uniformly sampled data
[RR-452] p 2472 N93-23375
Applications of parallel and vector algorithms in nonlinear structural dynamics using the finite element method
[PB93-142438] p 2439 N93-23436
Perception, scene reconstruction and world modeling for unmanned underwater vehicles
[PB93-146983] p 2459 N93-23443
Taming chaotic circuits
[AD-A259495] p 2439 N93-23449
Using recurrent networks for dimensionality reduction
[AD-A259497] p 2459 N93-23464
Precision geocoding demonstrator system p 2348 N93-23539
Radio location through high resolution eigenstructure processing techniques that yield accurate multipath AOA and differential time delay estimates p 2270 N93-23626
Multiple emitter direction finding from a circular array by single snapshot processing p 2270 N93-23627
Digital processing for positioning with one satellite p 2270 N93-23629
The WG sequences: Quasi perfect binary sequences p 2271 N93-23631
Least squares surface approximation to scattered data using multiquadric functions
[AD-A259804] p 2469 N93-23640
When networks disagree: Ensemble methods for hybrid neural networks
[AD-A260121] p 2460 N93-23701
Solving modal equations of motion with initial conditions using MSC/NASTRAN DMAP. Part 1: Implementing exact mode superposition
[NASA-TM-106063] p 2329 N93-23739
Inter-comparison of satellite derived passive microwave ice products p 2371 N93-23836
Time dependent classification of features with a nonlinear, dynamic network
[VTT-PUBS-83] p 2448 N93-23868
An investigation of multi-block structured algorithms for parallel CFD applications by a solution of 1D Burgers equation
[ETN-93-93703] p 2297 N93-23871
Implementation and performance evaluation of a parallel transitive closure algorithm on PRISMA/DB
[MEMO-INF-92-45] p 2448 N93-23873
Projective structure from two uncalibrated images: Structure from motion and recognition
[AD-A260102] p 2470 N93-24056
A new conjugate gradient method for optimal control
[MATHS-REPT-A-174] p 2462 N93-24077
Application and development of wavelet analysis
[AD-A260389] p 2489 N93-24240
Probability and statistics applied to the theory of algorithms
[AD-A259956] p 2473 N93-24248
What makes a good feature?
[AD-A259962] p 2463 N93-24249
Permissive planning: A machine-learning approach to planning in complex real-world domains
[AD-A260019] p 2521 N93-24303
Neural net architecture for computing structure from motion
[AD-A260526] p 2463 N93-24421
Multiobjective optimization of aerospace structures
[AD-A260433] p 2127 N93-24430
Parallel-vector unsymmetric Eigen-Solver on high performance computers
[NASA-CR-191417] p 2433 N93-24491
On essentially non-oscillatory schemes on unstructured meshes: Analysis and implementation
[NASA-CR-191415] p 2471 N93-24492
A novel recursive partitioning criterion
[AD-A259921] p 2464 N93-24564
A parameter-controlled relaxation algorithm for Bayesian restoration of images using the maximum entropy method (design, analysis, Mach band simulation and parallelization)
[ISBN-0-315-64776-0] p 2444 N93-24608
Versatile Reed-Solomon decoders
[ISBN-0-315-64738-8] p 2274 N93-24626
A user's manual for software GPR92
[MATHS-REPT-A-175] p 2444 N93-24642
A global path planning approach for redundant manipulators
[NASA-CR-193017] p 2320 N93-24656

ALIGNMENT
FALCON remote laser alignment system
[DE93-006448] p 2309 N93-23693

ALKALINITY
Oceanic CO measurements for the WOCE Hydrological Survey in the Pacific Ocean: Shipboard Alkalinity analyses during 1991 and 1992
[DE93-006900] p 2412 N93-22581

ALKANES
Computer-aided design of molecular catalysts for alkane oxidation using dodeca-substituted iron porphyrins
[DE93-004046] p 2218 N93-22520

ALLOCATIONS
Options of air traffic distribution in the Berlin region (Germany)
[DLR-FB-91-37] p 2117 N93-22660

ALLOYING
Using nonlinear acoustics for nondestructive materials characterization and evaluation
[DE93-004447] p 2321 N93-22727
High-temperature Au implantation into Ni-Be and Ni-Si alloys
[DE93-005555] p 2505 N93-23022
A solid state approach to the production of kilogram quantities of Si80Ge20 thermoelectric alloys
[DE93-004476] p 2508 N93-23691

ALPHA PARTICLES
Influence of alpha particle absorption on fundamental deuterium heating in a fusion plasma
[DE93-006824] p 2492 N93-22513
Alpha effects on TAE modes and alpha transport
[DE93-004160] p 2494 N93-22940

ALTERNATING CURRENT
Modelling a single phase voltage controlled rectifier using Laplace transforms
[NASA-TM-106005] p 2474 N93-23016
Distribution of trapped electrons at interface states in ACTFEL devices
[AD-A260396] p 2484 N93-24427

ALTERNATING DIRECTION IMPLICIT METHODS
Low altitude acoustic propagation analysis by use of a three-dimensional parabolic wave equation
[ONERA-P-1992-1] p 2477 N93-24190

ALTERNATIVES
COP improvement of refrigerator/freezers, air-conditioners, and heat pumps using nonazeotropic refrigerant mixtures p 2259 N93-22166
A reactor-pumped laser as primary power for nuclear rocket engines
[DE93-005342] p 2203 N93-22501
Global warming impacts of CFC alternative technologies: Combining fluorocarbon and CO2 effects
[DE93-002347] p 2384 N93-22972
Heat pump technology: Responding to new opportunities
[DE93-005939] p 2379 N93-22978
Advanced insulations for refrigerator/freezers: The potential for new shell design incorporating polymer barrier construction
[PB93-146991] p 2259 N93-24635

ALTITUDE CONTROL
Application of fuzzy logic-neural network based reinforcement learning to proximity and docking operations: Attitude control results
[NASA-CR-192291] p 2458 N93-23084
Perception/action: An holistic approach
[AD-A259597] p 2428 N93-24067

ALUMINIDES
Measurement of the critical level of moisture for initiation of water-vapor-induced environmental embrittlement in a Fe3Al-based alloy
[DE93-004104] p 2226 N93-22089
Analysis of residual phases in nickel aluminide powders produced by reaction synthesis
[DE93-005680] p 2233 N93-24014
Results on powder injection molding of Ni3Al and application to other intermetallic compositions
[DE93-005681] p 2213 N93-24016
Phase stability and electronic structure of transition-metal aluminides
[DE93-003584] p 2234 N93-24499

ALUMINUM
Nonlinear interaction of magnetohydrodynamic instabilities in radially imploded plasmas
[DE93-003834] p 2492 N93-22428
A solenoid with a low input power and a fast switching time
[DLR-FB-91-39] p 2278 N93-22661
Witness plate shock velocity study
[DE93-005742] p 2474 N93-22760
Substrate surface structure effects on microstructure of epitaxial films
[DE93-005562] p 2504 N93-22944
Kinetic energy distributions of sputtered neutral aluminum clusters: Al-Al6
[DE93-004815] p 2230 N93-22991
Non-chromated surface pretreatments for aluminum
[AD-A260130] p 2232 N93-23704
Composite passive damping struts for large precision structures
[NASA-CASE-NPO-17914-1-CU] p 2333 N93-24596

ALUMINUM ALLOYS
Built-up Al-Li structures for cryogenic tank and dry bay applications p 2175 N93-22099
Strain measurement in individual phases of an Al/TiC composite during mechanical loading
[DE93-003806] p 2208 N93-22432
The surface interaction of oxygen with a gamma TiAl
[DE93-003847] p 2227 N93-22517
Fracture properties of 7010 and 7050 aluminium alloys under inert and aggressive environmental conditions
[DLR-FB-91-35] p 2228 N93-22658
Characterization of doped NiAl by atom probe field ion microscopy
[DE93-005932] p 2228 N93-22692
Theoretical study of electron-phonon interaction in beta-phase NiTi and Ni-Al alloys
[DE93-004733] p 2228 N93-22738
Sputter ion plating on Ti6Al4V4 and Ti(cp): Preparation and properties of oxidation and wear resistant coatings
[MBB-Z-0444-92-PUB] p 2239 N93-23365
Elevated temperature fracture of advanced powder metallurgy aluminum alloy 8009 p 2231 N93-23588
Design of an ultra-high-strength weldable Al-Cu-Li alloy for space applications p 2211 N93-23936
Investigation of gas metal arc welding characteristics of alloy 6013 p 2211 N93-23937
Analysis of residual phases in nickel aluminide powders produced by reaction synthesis
[DE93-005680] p 2233 N93-24014
Results on powder injection molding of Ni3Al and application to other intermetallic compositions
[DE93-005681] p 2213 N93-24016
Acceptable aluminum additions for minimal environmental effect in iron-aluminum alloys
[DE93-006738] p 2234 N93-24329
Effects of processing parameters on the microstructure of a 30 w/o SiCw-2080 aluminum composite
[NRC-IAR-CR-20] p 2216 N93-24651

ALUMINUM CHLORIDES
Organic electrolytes for sodium batteries
[AD-A260242] p 2284 N93-24164

ALUMINUM COMPOUNDS
Gas source molecular beam epitaxial growth of GaN
| AD-A260524 | p 2512 N93-24199
ALUMINUM GALLIUM ARSENIDES
Ion beam mixing in multi-quantum well structures
| AD-A259772 | p 2516 N93-24509
ALUMINUM OXIDES
Evaluation of ceramic materials for an advanced steam-methane reformer
| DE93-005931 | p 2235 N93-22329
Ablation, melting, and smoothing of polycrystalline alumina by pulsed excimer laser radiation
| DE93-005148 | p 2227 N93-22496
A vibrational analysis of Au implanted Al2O3 single crystals: Ion and thermal annealing effects
| DE93-006216 | p 2501 N93-22508
Structure, stoichiometry and stability in magnetoplumbite and (beta)-alumina type ceramics
| DE93-007303 | p 2236 N93-22528
Influence of addition elements in copper or implanted in aluminum on the adhesion to the solid state of the copper/aluminum (Cu/Al2O3) system
| ECL-91-34 | p 2228 N93-22698
Measurement of the radiative transport properties of reticulated alumina foams
| DE93-000047 | p 2231 N93-23672
ALUMINUM-LITHIUM ALLOYS
National Launch System: Structures and materials
p 2172 N93-22083
Built-up Al-Li structures for cryogenic tank and dry bay applications p 2175 N93-22099
AMAZON REGION (SOUTH AMERICA)
The structure and energetics of Amazon squall lines
p 2404 N93-23166
Equatorial atmospheric weather regimes: Their structure and role p 2411 N93-24580
AMBIENT TEMPERATURE
Passive (self-powered) fiber-optic sensors
| DE93-005761 | p 2486 N93-22762
Exhaust emissions from diesel engines
| DE93-752852 | p 2384 N93-22805
Method of measuring nighttime U-values using the Mobile Window Thermal Test (MoWiTT) Facility
| DE93-004778 | p 2404 N93-22964
AMBIGUITY
Application and development of wavelet analysis
| AD-A260389 | p 2489 N93-24240
AMINO ACIDS
Photoinduced electron transfer in ordered polymers
| DE93-006784 | p 2237 N93-22889
Impact contribution of prebiotic reactants to Earth
| NASA-CR-192785 | p 2552 N93-24480
AMMONIUM NITRATES
Reacting liquid monopropellant sprays: Experiments with high velocity full cone sprays in 33 MPa, 500 C nitrogen
| AD-A259799 | p 2245 N93-23456
AMORPHOUS MATERIALS
Magnetic decoupling in sputtered Fe/Si superlattices and multilayers
| DE93-004204 | p 2499 N93-22064
Generalized melting criterion for amorphization
| DE93-005557 | p 2226 N93-22345
A vibrational analysis of Au implanted Al2O3 single crystals: Ion and thermal annealing effects
| DE93-006216 | p 2501 N93-22508
Optical and scratch resistant properties of diamondlike carbon films deposited with single and dual ion beams
| NASA-TM-105943 | p 2206 N93-22586
Critical current enhancement by neutron irradiation of rapidly textured BiSr2CaCu2O8
| DE93-004453 | p 2503 N93-22728
Pressure-induced amorphizations of silica analogues: A probe of the relationship between order and disorder
| DE93-007966 | p 2237 N93-22730
Amorphization kinetics of Zr(Cr,Fe)2 under ion irradiation
| DE93-005560 | p 2230 N93-22943
Molecular dynamics simulation of radiation-induced amorphization of the ordered compound NiZr2
| DE93-005558 | p 2230 N93-22977
The mechanical properties of a novel Si3N4-amorphous Si3N4 composite
| DE93-005473 | p 2210 N93-23246
Amorphous diffusion barriers for electronic device applications
| ETN-93-93476 | p 2281 N93-23366
Recrystallization of amorphous and nanocrystalline NdBa2Cu3O(7-x) and GdBa2Cu3O(7-x)
| DE93-004469 | p 2508 N93-23950
Metrologic support for the DARPA/NRL-XRL Mask Program: Ellipsometric analyses of SiC thin films on Si
| PB93-152098 | p 2225 N93-24632
AMORPHOUS SEMICONDUCTORS
Transport in amorphous semiconductors
p 2506 N93-23101
AMORPHOUS SILICON
Stable, high-efficiency amorphous silicon solar cells with low hydrogen content
| DE93-000049 | p 2377 N93-22750
In-situ characterization of growth and interfaces in a-Si:H devices
| DE93-000051 | p 2504 N93-22928
Research on the stability, electronic properties, and structure of a-Si:H and its alloys
| DE93-000050 | p 2505 N93-22969
The Photovoltaic Manufacturing Technology Project, phase 1
| DE92-010597 | p 2380 N93-23302
Growth mechanisms and characterization of hydrogenated amorphous-silicon-alloy films
| DE93-000071 | p 2508 N93-23673
Spectroscopic ellipsometry and interference reflectometry measurements of CVD silicon grown on oxidized silicon
| DE93-005767 | p 2509 N93-24017
AMPLITUDE MODULATION
A hybrid voice/data modulation for the VHF aeronautical channels p 2106 N93-22567
AMPLITUDES
Journal of research of the National Institute of Standards and Technology, Nov. - Dec. 1992, volume 97, no. 6
| PB93-143923 | p 2571 N93-24570
ANALOG TO DIGITAL CONVERTERS
Parallel processor for real-time structural control
| DE93-006284 | p 2446 N93-22545
Vibration Pattern Imager (VPI): A control and data acquisition system for scanning laser vibrometers
| NASA-TM-107721 | p 2476 N93-22553
A wideband parallel sampling system
| ISBN-0-315-60463-8 | p 2286 N93-24617
ANALYSIS (MATHEMATICS)
Performance and state-space analyses of systems using Petri nets
| NASA-CR-193195 | p 2443 N93-24604
ANALYZERS
Scattering in electron spectrometers, diagnosis, and avoidance. 1: Concentric hemispherical analysers
| NPL-DMM(A)-70 | p 2218 N93-22463
Scattering in electron spectrometers, diagnosis, and avoidance. 2: Cylindrical mirror analysers
| NPL-DMM(A)-71 | p 2218 N93-22464
ANCHORS (FASTENERS)
Blind fastening apparatus
| NASA-CASE-LAR-14542-1 | p 2311 N93-22384
ANECHOIC CHAMBERS
Fiber-optic interferometric sensors for measurements of pressure fluctuations: Experimental evaluation
| NASA-TM-104002 | p 2128 N93-23175
ANEMOMETERS
Comparison of anemometers for turbulence characterization
| DE93-004336 | p 2302 N93-22338
Pyroelectric anemometers and kinetic calorimeters
| PB93-141919 | p 2303 N93-23230
ANGLE OF ATTACK
Dynamic response characteristics of two transport models tested in the National Transonic Facility
| NASA-CR-191420 | p 2125 N93-23047
Numerical prediction of transition of the F-16 wing at supersonic speeds
| NASA-CR-192706 | p 2111 N93-23392
An investigation of the fundamental cause of asymmetric separated flow
| AD-A260296 | p 2114 N93-24263
An experimental investigation of a supercritical airfoil at transonic speeds
| NASA-TM-103933 | p 2300 N93-24534
ANGULAR DISTRIBUTION
From simple to complex reactions: Nuclear collisions near the Coulomb barrier
| DE93-004197 | p 2478 N93-22063
ANILINE
Comparison of different synthetic routes for sulfonation of polyaniline
| AD-A259662 | p 2222 N93-23658
Luminescencé and picosecond photo-induced absorption of polyaniline
| AD-A260002 | p 2242 N93-24436
Optical and magnetic signatures of localized excitations in pernigraniline: Role of neutral solitons
| AD-A260001 | p 2243 N93-24443
ANIMALS
CEBAS-Aquarack: An artificial aquatic animal plant ecosystem as a tool for basic research in the Columbus Space Station p 2166 N93-24401
ANISOTROPIC MEDIA
Three dimensional transient analysis of microstrip circuits in multilayered anisotropic media
| AD-A259829 | p 2281 N93-23433
ANISOTROPY
Propagation of elastic waves through inhomogeneous, anisotropic materials
| DE93-006247 | p 2288 N93-22509
Combined magnetic vector-scalar potential finite element computation of 3D magnetic field and performance of modified Lundell alternators in Space Station applications
| NASA-CR-192348 | p 2263 N93-23215
Anisotropic reflections in mountainous terrain to determine the absorption of solar radiation from satellite data
| ESA-TT-1262 | p 2558 N93-24633
ANNEALING
A vibrational analysis of Au implanted Al2O3 single crystals: Ion and thermal annealing effects
| DE93-006216 | p 2501 N93-22508
Phase diagram effects in rapid thermal processing of REBa2Cu3O(7-delta)
| DE93-004445 | p 2503 N93-22726
A comparison of twin boundary pinning in nearly fully stoichiometric and oxygen deficient YBa2Cu3O(7-delta)
| DE93-004854 | p 2503 N93-22745
Effects of rolling on the ductility of 80 percent tungsten heavy alloy
| DE93-004840 | p 2232 N93-23972
Cavities in He-implanted Si: Internal surface science
| DE93-005340 | p 2509 N93-24012
Superconductivity devices: Commercial use of space
| NASA-CR-192841 | p 2513 N93-24483
ANNIHILATION REACTIONS
An experimental search for gamma radiation associated with thunderstorm activity
| DE93-006939 | p 2403 N93-22584
Rigorous QCD predictions for decays of P-wave quarkonia
| DE93-004853 | p 2481 N93-22744
ANNUAL VARIATIONS
Monitoring of growth environment of forest
p 2336 N93-22135
Climate variability in a coupled GCM. Part 1: The tropical pacific
| MPIM-73 | p 2407 N93-23633
Intraseasonal relationships between tropical heating and extratropical jets
| AD-A260212 | p 2408 N93-24004
General circulation model output for forest climate change research and applications
| PB93-124626 | p 2388 N93-24015
Observed annual and interannual variations in tropospheric water
| PB93-123313 | p 2411 N93-24588
ANNULAR FLOW
Theoretical and pragmatic modelling of governing equations for a two-phase flow in bubbly and annular flow regimes
| DE93-004200 | p 2289 N93-22757
On the nonlinear interfacial instability of rotating core-annular flow
| NASA-CR-191432 | p 2289 N93-22811
ANNULAR PLATES
The effects of delamination on the vibrational characteristics of composite structural elements
p 2210 N93-23202
ANODES
PISCES Program: Plasma-materials interactions and edge-plasma physics research
| DE93-005089 | p 2491 N93-22406
100-kW class applied-field MPD thruster component wear
| NASA-TM-106023 | p 2203 N93-22482
Pilot demonstration of cerium oxide coated anodes
| DE93-002507 | p 2231 N93-23316
ANODIC COATINGS
Pilot demonstration of cerium oxide coated anodes
| DE93-002507 | p 2231 N93-23316
ANOMALIES
Constraint checking during error recovery
p 2445 N93-22169
Computer simulation of the anomalous elastic behavior of thin films and superlattices
| DE93-004154 | p 2504 N93-22939
The longitudinal occurrence of equatorial F layer irregularities p 2266 N93-23605
Irregular media effects on radiowave signals used in navigation and positioning systems
p 2266 N93-23606
ANTARCTIC REGIONS
Sea ice and glacier in the Antarctic from passive microwave observation p 2336 N93-22130
Long period pulsation events in electron precipitation and magnetic fields at the South Pole
p 2394 N93-23387
A nitrate signal of solar flares in polar snow and ice
| AD-A260559 | p 2558 N93-24284

ANTENNA ARRAYS
A class of hybrid finite element methods for electromagnetics: A review
[NASA-CR-192631] p 2260 N93-22467
Space power amplification with active linearly tapered slot antenna array
[NASA-TM-106036] p 2277 N93-22485
Data selection for fast projection techniques: A comparative study of direction finding performance
[AD-A259916] p 2262 N93-22814
High resolution sampled aperture array direction finding at HF p 2267 N93-23611
Fractal theory for large lacunar antenna arrays p 2269 N93-23624
Radio location through high resolution eigenstructure processing techniques that yield accurate multipath AOA and differential time delay estimates p 2270 N93-23626
Characteristics of linearly tapered slot antenna with CPW feed on high resistivity silicon
[NASA-TM-106057] p 2283 N93-23743
Novel optical processor for phased array antenna
[AD-A260474] p 2273 N93-24277

ANTENNA COMPONENTS
An experimental investigation of high temperature superconducting microstrip antennas at K- and Ka-band frequencies
[NASA-CR-191089] p 2277 N93-22479
Smart electromagnetic structures: The neural antenna
[AD-A260469] p 2262 N93-22931

ANTENNA COUPLERS
Fusion plasma theory. Task 3: Auxiliary radiofrequency heating of tokamaks
[DE93-005129] p 2493 N93-22796

ANTENNA DESIGN
Low frequency RF current drive
[DE93-005130] p 2260 N93-22421
Log-periodic slot antenna
[CA-PATENT-1-296-421] p 2272 N93-24203

ANTENNA FEEDS
Characteristics of linearly tapered slot antenna with CPW feed on high resistivity silicon
[NASA-TM-106057] p 2283 N93-23743

ANTENNA RADIATION PATTERNS
Fractal theory for large lacunar antenna arrays p 2269 N93-23624
Characteristics of linearly tapered slot antenna with CPW feed on high resistivity silicon
[NASA-TM-106057] p 2283 N93-23743
Antenna pattern control using impedance surfaces
[NASA-CR-192712] p 2273 N93-24471

ANTENNAS
Low frequency RF current drive
[DE93-005130] p 2260 N93-22421

ANTIFERROMAGNETISM
Oscillatory interlayer magnetic coupling of sputtered Fe/Nb superlattices
[DE93-004191] p 2499 N93-22062
Magnetic coupling of Fe/Mo/Fe and Co/Cu/Co sandwiches across wedged spacer layers
[DE93-004203] p 2502 N93-22523
Experimental studies of critical behavior of systems with quenched disorder
[DE93-005090] p 2228 N93-22717
The magnetism of metallic manganese alloys
[DE93-005153] p 2233 N93-24037

ANTIGRAVITY
Anti-gravity: The key to 21st century physics
[DE93-006929] p 2475 N93-24463

ANTIMATTER
Fundamental symmetry tests with antihydrogen
[DE93-005467] p 2479 N93-22541
An experimental search for gamma radiation associated with thunderstorm activity
[DE93-006939] p 2403 N93-22584

ANTIMISSILE DEFENSE
Military space capabilities and requirements p 2154 N93-23161

ANTIOXIDANTS
Combustion and heat transfer studies utilizing advanced diagnostics: Fuels research
[AD-A260249] p 2246 N93-24332

ANTIPARTICLES
Fundamental symmetry tests with antihydrogen
[DE93-005467] p 2479 N93-22541
Anti-gravity: The key to 21st century physics
[DE93-006929] p 2475 N93-24463

ANTIREFLECTION COATINGS
High-power optical coatings for a mega-Joule class ICF laser
[DE93-005821] p 2306 N93-22328

ANTISEPTICS
Framework for decision making: An EPA perspective
[PB93-134369] p 2518 N93-22904

ANVILS
Modeling of cloud/radiation processes for tropical anvils
[AD-A260203] p 2410 N93-24470

APERTURES
Pulse power requirements for large aperture optical switches based on plasma electrode Pockels cells
[DE93-005824] p 2279 N93-22997
High resolution sampled aperture array direction finding at HF p 2267 N93-23611
Optical diagnostics in supersonic plasma flows: Purging fluid effects
[DE93-006243] p 2497 N93-24042
FESDIF: Finite Element Scalar Diffraction theory code
[DE93-007222] p 2475 N93-24447
Antenna pattern control using impedance surfaces
[NASA-CR-192712] p 2273 N93-24471

APEXES
Numerical treatment of vertex singularities and intensity factors for mixed boundary value problems for the Laplace equation in R3
[AD-A260107] p 2469 N93-23713

APPLICATION SPECIFIC INTEGRATED CIRCUITS
Flexible high speed CODEC p 2287 N93-22178
Study and development of a multiprocessor interface circuit (thesis annex), volume 2
[ECL-91-11-VOL-2] p 2446 N93-22676
Sensor-based whole-arm obstacle avoidance utilizing ASIC technology
[DE93-003602] p 2279 N93-22819
VLSI architectural synthesis for DSP custom applications
[ISBN-0-315-57793-2] p 2433 N93-24621

APPLICATIONS PROGRAMS (COMPUTERS)
Advanced software development workstation. OOPSLA 1992 Conference. Trip report
[NASA-CR-192811] p 2432 N93-22041
Transportable Applications Environment (TAE) Plus: A NASA tool for building and managing graphical user interfaces p 2444 N93-22150
Microcomputer based software for biodynamic simulation p 2429 N93-22191
ATTIRE (analytical tools for thermal infrared engineering): A sensor simulation and modeling package p 2305 N93-22203
COSMIC software catalog, 1993
[NASA-CR-191005] p 2434 N93-22205
ESTAR, PSTAR, and ASTAR: Computer programs for calculating stopping-power and range tables for electrons, protons, and helium ions
[PB93-146033] p 2481 N93-22898
Alpha effects on TAE modes and alpha transport
[DE93-004160] p 2494 N93-22940
NTIA Terrain Data Base System Documentation (Program DUMPTERS, Extract and Terrnd). Version 4.0, October 1992
[PB93-108330] p 2343 N93-23254
SPRING2: Helical compression spring geometry generator program manual
[DREA-TC-92-314] p 2438 N93-23345
A nonlinear dynamic spherical membrane model
[AD-A259633] p 2112 N93-23654
PROMISC user manual, appendix 2
[NASA-CR-192989] p 2332 N93-24529
PROMISS user manual, appendix 1
[NASA-CR-192990] p 2333 N93-24530
A trajectory generation and system characterization model for cislunar low-thrust spacecraft. Volume 1: User's manual
[NASA-CR-185171] p 2205 N93-24536
Global ecosystems database. Version 1.0 (on CD-ROM). EPA global climate research program. NOAA/NGDC global change database program. Documentation manual, DISC-A. Volume 1. NGDC key to geophysical records documentation No. 27
[PB93-146090] p 2390 N93-24645

APPROACH CONTROL
Approach range and velocity determination using laser sensors and retroreflector targets p 2147 N93-22297
Operational evaluation of the converging runway display aid at Saint Louis
[MTR-92W0000217] p 2133 N93-22874

APPROPRIATIONS
Report to the Chairman, Subcommittee on Defense, Committee on Appropriations, House of Representatives. Intelligence programs: New RC-135 aircraft engines can reduce cost and improve performance
[AD-A259283] p 2105 N93-22397

APPROXIMATION
Approximation paper, part 1 --- neural networks, fuzzy systems p 2456 N93-22372
An approximate method for estimating the lifting characteristics of thin bodies of non-circular cross-section
[CRANFIELD-AERO-9006] p 2108 N93-22395
Improving the chi-squared approximation for bivariate normal tolerance regions
[NASA-TP-3304] p 2472 N93-22670
The asymptotic spectra of banded Toeplitz and quasi-Toeplitz matrices
[NASA-TM-103900] p 2467 N93-22829
Effect of code augmentation or truncation on the signals produced by a time-integrating correlator
[AD-A259802] p 2264 N93-23458
CFD-based approximation concepts for aerodynamic design optimization with application to a 2-D scramjet vehicle p 2126 N93-23505
Determining nodes and long-time approximations to the Navier-Stokes equations p 2296 N93-23593
Least squares surface approximation to scattered data using multiquadric functions
[AD-A259804] p 2469 N93-23640
Convergence rates of approximation by translates
[AD-A260100] p 2470 N93-24055
The role of the dipole-dipole interaction in the solvation of monoatomic monovalent ions on the basis of the mean spherical approximation
[AD-A260284] p 2483 N93-24234

AQUATIC PLANTS
CEBAS-Aquarack: An artificial aquatic animal plant ecosystem as a tool for basic research in the Columbus Space Station p 2166 N93-24401

AQUEOUS SOLUTIONS
Methods for predicting properties and tailoring salt solutions for industrial processes p 2226 N93-22183
Electronic control of pH at sulfonated polyaniline electrodes
[AD-A260074] p 2222 N93-23963

ARABIAN SEA
US Navy regional climatic study of the Persian Gulf and the Northern Arabian Sea
[AD-A260363] p 2409 N93-24239

ARC JET ENGINES
Development of arcjet and ion propulsion for spacecraft stationkeeping
[NASA-TM-106102] p 2204 N93-23747

ARC WELDING
Imaging technique for welding studies
[DE93-006449] p 2316 N93-23694
Investigation of gas metal arc welding characteristics of alloy 6013 p 2211 N93-23937

ARCHITECTURE (COMPUTERS)
Application of fuzzy logic-neural network based reinforcement learning to proximity and docking operations: Translational controller results
[NASA-CR-192320] p 2457 N93-22396
Parallel processor for real-time structural control
[DE93-006284] p 2446 N93-22545
Survey of benchmarks
[NPL-DITC-192/91] p 2436 N93-22816
Automatic code generation for distributed robotic systems
[DE93-005779] p 2447 N93-22996
Space Generic Open Avionics Architecture (SGOAA) standard specification
[NASA-CR-188245] p 2199 N93-23003
Isomorphic routing on a toroidal mesh
[NASA-CR-191430] p 2437 N93-23058
A stochastic learning algorithm for layered neural networks
[DE93-003555] p 2458 N93-23288
LOTOS specification style for OSI
[MEMO-INF-92-46] p 2448 N93-23357
Asynchronous design for parallel processing architectures
[AD-A259776] p 2448 N93-23453
A new process for acquiring software architecture
[AD-A259487] p 2439 N93-23463
Design and analysis of scheduling policies for real-time computer systems
[AD-A259806] p 2448 N93-23641
Northeast Parallel Architectures Center (NPAC)
[AD-A259627] p 2448 N93-23653
Validation of distributed systems by fault injection
[LAAS-92180] p 2472 N93-23864
Protocol design and implementation using formal methods
[MEMO-INF-92-43] p 2440 N93-23867
Shiva Mark 2 hardware architecture, version 1
[AD-A259534] p 2449 N93-24039
Real-time signal processing systems
[AD-A259548] p 2272 N93-24084
Architecture for human-computer design, management and coordination in a collaborative AEC environment p 2528 N93-24186
Assigning sites to redundant clusters in a distributed storage system
[AD-A260458] p 2528 N93-24196
Information handling as task layer of Columbus user support p 2163 N93-24383

The actor model
[AD-A260196] p 2442 N93-24469
CONVEX mini manual
[NASA-TM-107564-REV] p 2433 N93-24594
Hyperstructures as computer architectures for high performance multiprocessor systems
[ISBN-0-315-58975-2] p 2433 N93-24613
VLSI architectural synthesis for DSP custom applications
[ISBN-0-315-57793-2] p 2433 N93-24621

ARCTIC OCEAN
The Oden real time ice monitoring demonstration p 2371 N93-23837

ARCTIC REGIONS
Observation in Arctic p 2336 N93-22133
High Arctic high frequency radio communications and a seven day polar cap absorption event
[DREP-TM-91-18] p 2264 N93-23344
Arctic Contaminants Research Program: Research Plan
[PB93-135630] p 2387 N93-23439
Report of the Sea Ice Thickness Workshop
[AD-A259696] p 2414 N93-23663
ERS-1 SAR ice routing of l'Astrolabe through the Northeast passage p 2358 N93-23759
Airborne studies of ocean-particle-cloud interactions
[AD-A259874] p 2415 N93-23958
Test and evaluation of neural network applications for seismic signal discrimination
[AD-A260030] p 2401 N93-24440

ARGENTINA
Monitoring desertification in Patagonia/Argentina, using satellite data for sustainable environmental management p 2367 N93-23813

ARGON ISOTOPES
Amorphization kinetics of Zr(Cr,Fe)2 under ion irradiation
[DE93-005560] p 2230 N93-22943

ARGON PLASMA
Inexpensive capillary discharge x ray laser driver
[AD-A260388] p 2310 N93-24276

ARID LANDS
Use of Special Sensor Microwave/Imager (SSM/I) for estimation of precipitation features in a semi-arid, mountain region: A case study of southwest Saudi Arabia p 2407 N93-23721

ARIZONA
Small business profiles, 1992. Region 9: Arizona, California, Hawaii, and Nevada
[PB93-111003] p 2521 N93-24160

ARKANSAS
Small business profiles, 1992. Region 6: Arkansas, Louisiana, New Mexico, Oklahoma, and Texas
[PB93-110971] p 2520 N93-24159

ARMATURES
A multiple armature railgun launcher
[AD-A259768] p 2171 N93-23486

ARRAYS
Field programmable gate arrays: Evaluation report for space-flight application
[NASA-CR-192796] p 2432 N93-23042

ARTIFICIAL GRAVITY
Research opportunities with the Centrifuge Facility p 2187 N93-22627

ARTIFICIAL INTELLIGENCE
Reactive control and reasoning assistance for scientific laboratory instruments p 2465 N93-22186
On-board fault management for autonomous spacecraft p 2140 N93-22255
Intelligent systems technology infrastructure for integrated systems p 2145 N93-22285
On the neural substrates leading to the emergence of mental operational structures p 2453 N93-22355
A hierarchical structure for representing and learning fuzzy rules p 2454 N93-22358
Multi-layered reasoning by means of conceptual fuzzy sets p 2455 N93-22365
AEROBA: A control blackboard approach for model formulation p 2524 N93-23183
Activities report 1990: Projects and services of the Research Department
[ETN-93-93692] p 2571 N93-23426
Perception, scene reconstruction and world modeling for unmanned underwater vehicles
[PB93-146983] p 2459 N93-23443
Automatic analysis and synthesis of controllers for dynamical systems based on phase-space knowledge
[AD-A259491] p 2459 N93-23448
Taming chaotic circuits
[AD-A259495] p 2439 N93-23449
Using recurrent networks for dimensionality reduction
[AD-A259497] p 2459 N93-23464
The analysis of remotely sensed data with neural networks p 2355 N93-23579
Convergence rates of approximation by translates
[AD-A260100] p 2470 N93-24055
Face recognition with neural networks
[AD-A259587] p 2462 N93-24066
The multi-scale veto model: A two-stage analog network for edge detection and image reconstruction
[AD-A259600] p 2462 N93-24069
Space efficient 3D model indexing
[AD-A259571] p 2462 N93-24085
A global approach to parameter estimation of chaotic dynamical systems
[AD-A259932] p 2463 N93-24130
Analysis and synthesis of adaptive neural elements and assemblies
[AD-A259954] p 2422 N93-24247
What makes a good feature?
[AD-A259962] p 2463 N93-24249
Transformational planning of reactive behavior
[AD-A260350] p 2463 N93-24270
Distance metric between 3D models and 2D images for recognition and classification
[AD-A260069] p 2463 N93-24313
Analytical representation of contours
[AD-A260151] p 2471 N93-24415
Machine-assisted human classification of segmented characters for optical character recognition testing and training
[PB93-152155] p 2529 N93-24631
Petri net controllers for distributed robotic systems
[NASA-CR-193196] p 2320 N93-24658

ARTIFICIAL SATELLITES
MSFC Three Point Docking Mechanism design review
[NASA-CR-192462] p 2181 N93-22013
Flight project data book
[NASA-TM-108657] p 2152 N93-22870
Optimal three-dimensional matched filter processing for detection of point-like moving objects in clutter
[AD-A259727] p 2487 N93-23469

ASCENT PROPULSION SYSTEMS
NLS cycle 1 and NLS 2 base heating technical notes. Appendix 3: Preliminary cycle 1 NLS base heating environments. Cycle 1 NLS base heating environments. NLS 2 650K STME base heating environments
[NASA-CR-192454] p 2202 N93-22012

ASIA
Training courses on application of remote sensing and geographic information systems in monitoring and managing tropical rainforests and natural environment p 2367 N93-23812

ASSAYING
Mini-satellite exploration of very near Earth space fuel objects
[DE93-005253] p 2195 N93-24057

ASSEMBLING
Space assembled entry systems certification p 2176 N93-22106

ASSEMBLY
Aerobraking technology studies p 2173 N93-22089
Blind fastening apparatus
[NASA-CASE-LAR-14542-1] p 2311 N93-22384

ASTEROIDS
Near-earth object interception workshop summary
[DE93-003793] p 2546 N93-22403
Reports of planetary astronomy - 1991
[NASA-TM-4459] p 2542 N93-23055
Asteroid detection and monitoring using a satellite-borne visible scanner
[AD-A259797] p 2543 N93-23455

ASTRO MISSIONS (STS)
Review of results from the Hopkins Ultraviolet Telescope aboard the Astro-1 mission p 2535 N93-23891

ASTRODYNAMICS
New developments in astrodynamics algorithms for autonomous rendezvous p 2144 N93-22279

ASTROMETRY
Status and early results of the Hipparcos astrometry project p 2533 N93-23879

ASTRONAUT PERFORMANCE
Task Analysis of Shuttle Entry and Landing Activities
[NASA-TM-104761] p 2178 N93-22702

ASTRONAUT TRAINING
Environment Observation and Climate Modelling Through International Space Projects. Columbus Eight (COSY-8): Utilisation of Earth Orbiting Laboratories
[ESA-ISY-4] p 2154 N93-24336
The European astronauts training programme p 2156 N93-24346
Training facilities at the Crew Training Complex p 2156 N93-24347
Mir 1992 operations and crew training p 2157 N93-24352
Flight experiences on board Space Station Mir p 2157 N93-24355
Development and implementation of the MotoMir experiment on the Mir Space Station p 2159 N93-24363

ASTRONAUTS
TALON and CRADLE: Systems for the rescue of tumbling spacecraft and astronauts p 2142 N93-22268
Selection of astronauts for European space missions p 2156 N93-24345

ASTRONOMICAL CATALOGS
ROSAT all sky survey observations of IRAS galaxies
[MPE-PREPRINT-220] p 2542 N93-22462
Fifth fundamental catalogue. Part 2: The FK5 extension - new fundamental stars
[REPT-33(1991)] p 2542 N93-23346
Carlsberg meridian catalogue La Palma (Spain). Number 6: Observations of positions of stars and planets 1990
[ISBN-84-7469-052-8] p 2543 N93-24059

ASTRONOMICAL MAPS
Mapping the Universe: Statistical measures of the galaxy distribution
[ETN-93-93456] p 2542 N93-23116
The ROSAT all-sky x ray survey p 2533 N93-23880

ASTRONOMICAL MODELS
An MHD study of the interaction between the solar wind and the interstellar medium
[NASA-CR-192353] p 2556 N93-23067
The radiation gasdynamics of planetary nebulae p 2547 N93-23133
A modified flow/field model of the solar wind interaction with Mars p 2556 N93-23216
Observations and modeling of the dust and gas in an isolated diffuse interstellar cloud p 2549 N93-23722
Temporal and spatial inhomogeneities in comets p 2551 N93-24188

ASTRONOMICAL OBSERVATORIES
The Goldstone solar system radar: A science instrument for planetary research
[NASA-CR-192793] p 2261 N93-22478
Activities report of the European Southern Observatory
[ETN-93-93459] p 2542 N93-23118
INTEGRAL: International Gamma Ray Astrophysics Laboratory p 2170 N93-23932

ASTRONOMICAL PHOTOGRAPHY
Ground-based optical support for gamma ray satellite activities p 2170 N93-23909

ASTRONOMICAL PHOTOMETRY
Status and early results of the Hipparcos astrometry project p 2533 N93-23879
The optical counterparts of the x ray binaries in NGC 6712 and 47 Tucanae p 2538 N93-23914

ASTRONOMICAL POLARIMETRY
The liquid crystal polarimeter for solid-state imaging of solar vector magnetic fields
[AD-A260029] p 2483 N93-24251

ASTRONOMICAL SATELLITES
Environment Observation and Climate Modelling Through International Space Projects. Space Sciences with Particular Emphasis on High-Energy Astrophysics
[ESA-ISY-3] p 2533 N93-23878
ROSAT: The German x ray satellite nearly two years in orbit p 2538 N93-23916
Concept of a small satellite for URM p 2199 N93-23922
SAX overview p 2540 N93-23927
